**Economy.** All forms of agriculture and business were disrupted and the principal towns demolished during the war. The gathering of copra, formerly the chief industry on Guam, has almost ceased. Except for small enterprises, such as the making of soap, there is no manufacture on Guam. Most of the civilian population are earning their livelihood at present from employment by the United States Navy. The wholesale trade for July 1946 was \$145,212.26 and the retail trade \$184,797.03. Sales of

island handicraft in Guam for July 1946 amounted to \$5,228.95. The Bank of Guam has been reopened with resources of more than \$5,000,000.

**GUATEMALA.** A republic in Central America. Area: 42,042 square miles. Population: 3,283,209 (1944). Capital: Guatemala City.

Guatemala is the northernmost of the Central American republics. Volcanic highlands separate the broad Pacific coastal plain from the low tableland of the north. A hot climate prevails in the lowlands along the Gulf of Honduras on the east, while temperate climates are found in the intermont basins of the highlands.

**The People.** Over half of the total population of Guatemala are Indians; the rest are chiefly mestizos and persons of European descent. The south and west are the most densely populated areas of the country. The largest cities are: Guatemala City, 162,826; Quetzaltenango, 33,500; and Puerto Barrios, 15,800.

Spanish is the official language, but Indian languages are also spoken. Roman Catholicism is the predominant religion.

According to the 1940 census about one-third of the population over 7 years of age is literate. In 1943 there were 2,784 primary schools with a total of 152,274 students; 69 intermediate schools with a total of 6,552 enrolled; and the National University in the school year 1943 had 694 students. The Guatemalan Government in 1945 embarked upon a 4 to 6 year educational campaign, under which every literate individual between the ages of 18 and 60 (except for individuals especially exempted) is required to teach one illiterate to read and write.

**Government.** Guatemala is a centralized republic of 22 departments. A new Constitution signed Mar. 11, 1945, replaced that of 1879. The Constitution provides for a unicameral Congress. Members are elected for 4-year terms but may not serve for 2 successive terms. The two regular sessions of Congress are limited to a total of 6 months a year. The president is elected for a 6-year term and may not be reelected until after a lapse of 12 years. He is assisted by a Cabinet of 7 members. Members of the armed forces may not be elected to Congress or to the presidency. Municipal mayors and councils are chosen by direct popular vote. Dr. Juan José Arévalo Bermejo was elected President in December, 1944, and inaugurated on March 15, 1945.

**Events, 1946.** Guatemala entered 1946 with a new Constitution and a popularly elected President, Juan José Arévalo, who had promised his country's large Indian population extensive social and economic improvements. On January 11 it was reported that the President had removed Jorge Toriello from the post of Minister of Finance. Although Toriello was a former member of the revolutionary triumvirate that deposed General Jorge Ubico from the Presidency in 1944, there had arisen increasing disagreement on national policy between him and the President. Previous to his removal, Toriello had questioned the validity of municipal elections and had demanded a recount, which was denied by the Government. Further conflict with President Arévalo resulted from Toriello's demands for the revision of contracts held by foreign commercial companies and his plan for the establishment of Government-monopoly ports.

At the end of January President Arévalo's popularity was increased by his escape from death when his automobile plunged 600 feet down a precipice.

An agreement to abolish passports between El Salvador and Guatemala was reached on May 17

and hailed as the initial step toward the realization of a much-discussed Central American Union. Signed by President Arévalo and El Salvador's President Castenada Castro, the pact provided for free travel between the two countries on a "Central American" citizenship card, to be issued by a tourist commission. On September 12 representatives of the five Central American republics met in Santa Ana, El Salvador, to discuss the projected Central American Union.

On June 1 the Arévalo Administration moved to eliminate remaining traces of the Ubico regime. The properties acquired by Ubico after he became President, which were valued at \$786,984, were put on public auction and the former President's commission as a general was canceled for public violations of the Constitution. The commissions of ten other generals, all in exile, were canceled for various reasons.

Through the summer and into the end of the year, the political and labor situation in Guatemala increased in intensity. On July 14 two army non-commissioned officers were sentenced to ten years in prison for participation in an alleged plot to overthrow the Government. A peaceful crowd demonstrated before the Presidential palace in the following month as a protest against an election law and restrictions on the freedom of the press imposed by newsprint rationing. In an interview with members of the Patriotic Conciliation Committee in October, President Arévalo said he approved of a political accord between the Government and its opponents and promised unrestricted press freedom. He analyzed his administration as leftist, but in no way extremist or Marxist.

The foreign firms in Guatemala received Congressional attention on September 22 with the appointment of a committee to revise contracts with and concessions to all foreign companies. Payments on the British loan by former President Ubico were also under investigation by the committee because of certain doubtful aspects. Earlier in the year Congress passed a labor law requiring all business concerns to employ at least 85 percent Guatemalans. The former law required a 75 percent quota of native employees.

President Arévalo touched on the subject of foreign businesses in a meeting with Mexico's President Manuel Comacho. In a speech at Tapachula President Arévalo created a stir of speculation by saying that Mexico's expropriation of foreign oil properties in 1938 was a "continental guide" for the assertion of national sovereignty. Guatemala would refuse foreign intervention "in support of powerful commercial groups, which will suddenly discover to their sorrow that national sovereignty exists and will be defended even with blood."

Apparently, the reference was made in the direction of the United Fruit Company, whose workers went on strike in mid-October. The Company termed the strike illegal and refused to negotiate until thirty days after the resumption of work. On the day following President Arévalo's speech, the strike was suspended and the United Fruit Company agreed to rehire hundreds of discharged workers.

On September 8 several thousands of demonstrators, organized by labor unions and the Administration political party paraded in Guatemala City in support of the Government. The parade was intended to answer the protest demonstration in August.

Strikes and slow-downs were prohibited by the Government on December 21 in a law passed on the day before Congress adjourned. The action

was produced as two nation-wide strikes threatened against the United Fruit Company and the International Railways of Central America, both foreign-owned enterprises.

**National Economy.** Guatemalan economy is agricultural; about 90 percent of the population are engaged in farming. In 1940 over 60 percent of the land cultivated was planted to corn, the chief crop and staple food of the country. Beans are another important staple crop. Coffee, bananas, and chicle are important export crops. The 1944-45 coffee crop is estimated to total 1,000,000 bags of clean coffee. It is estimated that Guatemala has a potential production of 724,000 stems of bananas monthly.

There are small pastoral and manufacturing industries. Meat requirements are met by domestic production. Manufacturing consists chiefly of processing agricultural products and of making such items as textiles, leather goods, cement, soap, furniture, etc.

**Foreign Trade.** The chief export products are coffee, bananas, and chicle. Coffee exports during the quota year 1944-45 totaled 855,170 bags of 60 kilograms each, of which 765,388 bags, or 89.5 percent, were shipped to the U.S.; the remainder went principally to Canada and Switzerland. During 1944 Guatemala exported 4,495,078 stems of bananas, about a 60 percent increase over stems exported in 1943. A total of 3,480,295 pounds of chicle and chiquibul was extracted and shipped during 1944. Exports of honey and beeswax increased in 1944 over the preceding year. In 1942 total exports were valued at 20.4 million dollars, of which the U.S. took 92 percent. Exports to the U.S. from Jan. 1 to Oct. 1, 1945, totaled approximately \$21,500,000. Principal exports in order of value were: coffee, bananas, chicle, lumber, citronella oil, hand-woven Indian textiles, and lemon-grass oil.

**GUGGENHEIM MEMORIAL FOUNDATION, The John Simon.** A foundation created in 1925 by Simon Guggenheim and his wife as a memorial to a son who died at the age of 18. The original endowment was \$3,000,000 enlarged to \$7,000,000 by 1939, and further increased upon the death of Simon Guggenheim in 1941. In fulfilling its purpose to "promote the advancement and diffusion of knowledge and the appreciation of beauty" the Foundation awards Fellowships, normally \$2,500 a year, to citizens of the United States, Canada, and certain Latin American countries. Since its establishment the Foundation has granted 1,704 Fellowships with stipends totaling \$3,645,360. In the year 1946 the Foundation granted 165 Fellowships with stipends totaling \$430,100.

**GYMNASTICS.** The stress on physical fitness during the war years was reflected in the record field of 203 gymnasts that took part in the National A.A.U. championships at the New York A.C. in 1946. Top honors in the men's division were regained by a well-balanced team from the Swiss Gymnastic Society of Union City, New Jersey, which scored 49 points to dethrone the 1945 winners from Penn State College, runner-up with 41 tallies.

All-around victor was Frank Cumiskey of the Swiss team, who also kept his titles on the horizontal bar and the side horse.

Star of the women's group was Miss Clara Schroth of the Philadelphia Turners who retained her all-around laurels and, in addition, won four other titles.

THOMAS V. HANEY.

**HAITI.** A West Indian republic. Area: 10,700 square miles. Population: 3,500,000 (1945). Capital: Port-au-Prince.

Over 80 percent of the surface of Haiti is mountainous. Lowlands along the northern coast are moist, while the lowlands in the west are semi-arid. An elevated basin forming the Plaine Centrale lies adjacent to the southern margin of the Cordillera Central, and between the Cordillera and the mountains of the southern peninsula is a deep depression known as the Cul de Sac. High temperature and excessive evaporation lower the effectiveness of the rainfall. The climate in centers of population is warm, generally pleasant, and healthy.

**Population.** The population of Haiti is concentrated along the northern and southern coasts. About 95 percent is Negro, the remainder chiefly mulatto. The leading cities are: Port-au-Prince, 150,000; Cap-Haitien, 12,000; and Aux Cayes, 11,900.

French is the official language, but most of the people speak Creole French. The predominant religion is Roman Catholic.

It was estimated in 1944 that about 8 percent of the population over 10 years of age is literate. In 1941, 85,000 pupils received primary instruction in 835 schools; 35 intermediate schools enrollment, and six institutions of higher education had a total of 236 students. Under a recent reorganization, higher education will be offered in private and special schools organized by the state or under state auspices, in addition to that available at the University of Haiti.

An extensive program of popular education has been initiated by the new government.

**National Economy.** Agriculture is the basis of Haitian economy. The most important crops are coffee, cotton, sugar, sisal, bananas, and cacao. Haiti's annual coffee crop averages 31,000,000 kilograms. In 1945 molasses production totaled 2,374,183 gallons, most of which was shipped to the U.S.; sugar production reached 50,266 short tons. In recent years there has been intensive development of the sisal industry, and production was expected to reach about 10,000 metric tons in 1945. Ginned cotton production in recent years has averaged about 2,727 metric tons. Agriculture is having a new impetus with the development of irrigation projects and technical farming.

Mineral resources of Haiti have not been developed, but are reported to be extensive. Manufacturing is confined chiefly to processing of coffee, sugar, and sisal, with some soap and tobacco products. A handicraft industry of some importance has been developed in recent years.

**Foreign Trade.** Haiti's total foreign trade in 1944 was valued at \$31,826,000, the highest recorded since the late 1920's. Exports in 1944 were valued at \$15,786,000. Of the total value, the United States took 67.3 percent; the United Kingdom 11.7, Canada 10.5, Colombia 5.4, Switzerland 1.9, Cuba 1.1. Banana exports for 1944-45 totaled 4,104,825 stems valued at \$2,506,931. The entire 1944-45 sugar export totaling 32,651 metric tons, was shipped to the United Kingdom, under the International Sugar Agreement. Exports of coffee for 1944-45 totaled 23,116,197 kilograms, valued at \$7,290,136. Exports in 1944 of sisal totaling 7,985 metric tons were valued at \$1,381,089; of cotton totaling 3,733 metric tons, at \$962,616; of cacao totaling 1,341 metric tons, at \$205,341.

Haitian imports in 1944 were valued at \$16,040,000, of which the U.S. supplied 70.8 percent; Mexico 14.8; Argentina 3.8; Curaçao 2.8; India 2.4; Cuba 1.9; Canada 1.6; and the United Kingdom

1.4. Principal imports were: cotton textiles, food-stuffs, manufactured products, chemicals and pharmaceuticals, iron and steel products, and fuel and lubricating oils.

**Government.** Under the Constitution of 1932 Haiti is a centralized republic of 5 departments. It has a bicameral National Assembly: a Senate of 21 members, and a Chamber of Deputies of 37. The president is elected for a 6-year term and is aided by a Cabinet of 6 ministers. President Dumarsais Estimé was elected on August 16, 1946.

**Events, 1946.** Haiti was gripped by a full-scale revolution in early January that deposed President Elie Lescot on January 11 and put a military junta into power. The revolt was primed when President Lescot banned the student newspaper *La Ruche* and arrested its editors for printing anti-Lescot material. Students who took to the streets in protest were joined by the towns-people of Port-au-Prince in demonstrations that reached their climax on January 10. Several persons were reported killed in clashes with the police as most of Haiti's population went on strike.

On the following day army Chief of Staff Col. Frank Lavaud persuaded Lescot to resign. Lescot, who had been President since 1941 and former Ambassador to the United States, was given safe conduct out of the country and fled to Miami, Florida.

A three-man military junta, headed by Col. Lavaud and including Major Paul Magliore, commander of the national palace military household, and Major Antoine Levelt, director of the military academy, immediately assumed control of the country.

A variety of leftist and liberal political groups formed and pressed Colonel Lavaud for a definite election date. Lavaud called a national Congressional election for May 12. The Congress would act as a Constituent Assembly to write a Constitution and then elect a President. Until that time, Lavaud said, a widely representative junta Cabinet would rule the country and "all freedoms necessary for establishing an entirely democratic government" would be guaranteed.

With the end of the Lescot regime, the people of Haiti expected a salutary revision in their country's economy which had forced a major portion of the population to marginal living. When the junta did not revive Haiti's economy immediately, an angry mob rioted in the Port-au-Prince streets on February 18. The riot occurred after the Ministry of Public Works informed them that the jobs available in large public works program were not sufficient to meet the demands of the entire group.

The United States announced on April 8 that the military junta of Haiti was recognized as the interim regime and diplomatic relations would be resumed. The United States Department of State said that recognition was made after consultation with other American republics and for the following reasons: (1) The military junta was in control of the Government; (2) it enjoyed the support of the people; and (3) it promised to fulfill all international obligations.

In a relatively peaceful election, with minor post-balloting disorders on May 12, political extremists lost as fifty-six of the fifty-eight seats were won by the Democrats, representatives of the mulatto ruling class. On August 16 the National Constituent Assembly elected Dumarsais Estimé to the Presidency. The President had been Secretary of Education in 1937 under President Stenio Vincent and was the only Deputy who refused to vote for Lescot in 1941 and 1944.

**HANDBALL.** Angelo Trulio, 40-year-old veteran representing the Ninety-second Street Y.M.H.A. of New York, added another trophy to his growing collection of prizes when he captured singles honors in the national A.A.U. four-wall softball tournament at San Francisco last season.

After eliminating Joe Platak of Long Beach, California, the defending title-holder, in a semi-final upset, the Brooklyn ace turned back the challenge of Gus Lewis, Buffalo steeplejack, in the last round. Trulio, who also won New York State laurels, subdued the 27-year-old Lewis, the national Y.M.C.A. king, by 21-13, 21-5.

National doubles honors were annexed by the New York A.C. combination of Eddie Linz and Frank Coyle.

THOMAS V. HANEY.

**HAWAII, Territory of.** A territory of the United States, composed mainly of the eight inhabited islands of the Hawaiian Island group, in the North Pacific Ocean and within the tropics. Honolulu, the capital, is located on Oahu Island, 2,408 miles from San Francisco. The islands that form the Territory have a combined area of 6,407 square miles.

**The People.** The population of Hawaii as of Apr. 1, 1940, was 423,330, as compared with an estimated population of 465,339 on June 30, 1941. There were 387,197 citizens (139,299 Caucasians, 124,351 Japanese, 52,445 part-Hawaiians, 24,886 Chinese, 18,050 Filipinos, 8,460 Puerto Ricans, 4,628 Koreans and 832 others), as compared with 78,142 non-citizens (35,183 Japanese, 34,010 Filipinos, 4,351 Chinese, 2,328 Caucasians, 2,253 Koreans and 170 others). Prior to the war the ratio of males to females was 2 to 1, but after Pearl Harbor the ratio increased to 150 to 1. In 1941 Honolulu had 200,158 inhabitants.

In addition to the University of Hawaii there are 196 public schools (12 high schools, 17 intermediate, 145 elementary, and 22 vocational and miscellaneous) and 121 private schools (elementary through college) on the islands.

**Economy.** The three leading industries are the tourist trade, sugar and pineapple. Although the tourist industry had been seriously handicapped by the war it was soon revived by the resumption of commercial air and steamship services. Hawaii had 94 modern hotels located as follows: 70 on the Island of Oahu, 8 on Hawaii, 3 on Kauai, and 13 on Maui. Exports to the United States mainland of Hawaiian products were valued at \$82,618,845 of which unrefined sugar represented \$52,277,853 and canned pineapples \$18,728,401. Imports from the United States mainland were valued at \$185,900,000. Edible animals and animal products, vegetable food products and beverages, and textile fibers and manufactures were the chief commodities imported.

**Government.** The head of the Territorial Government is Governor Ingram M. Stainback, who holds office by appointment of the President of the United States for a term of four years. The registered voters of the Territory elect quadrennially 15 Senators and biennially 30 Representatives, constituting the Legislature. This body passes appropriations and other acts within the Territorial authority. The popular vote elects to each U.S. Congress a Delegate (Joseph R. Farrington), with a voice, but no vote, in the House of Representatives.

**Events, 1946.** At the outset of 1946 Hawaii resumed her campaign, which had lapsed during the war years, to be admitted to the Union as a full-fledged state. At the hearings on statehood before the United States House Territories Fact-

Finding Subcommittee, the Hawaii Sugar Planters Association on January 8, introduced a report on the Islands' war record which showed that Hawaii had efficiently answered all wartime demands on her people, industries, and businesses.

A few days after President Truman's Congressional message, in which he urged statehood for the Islands, the House sub-Committee reported on January 24 that "the Territory of Hawaii now meets the necessary requirements for statehood." Recommending immediate consideration of legislation to admit Hawaii as the forty-ninth State, the Subcommittee said that Hawaii's mixed racial complexion (Caucasians, Hawaiians, part-Hawaiians, Japanese, Chinese, Koreans, Puerto Ricans, and Filipinos) represented no barrier to statehood. The report showed that the Caucasian population had increased steadily since 1878 and had reached 34.4 percent of the total population, while the Japanese population, 32.5 percent at the time of the report, reached its peak in 1940 and was on the decline.

The United States military forces' administration of martial law and the suspension of the writ of habeas corpus in Hawaii during the war was recommended for investigation by the United States Senate Judiciary Committee on January 21. The recommendation was prompted by numerous complaints charging that the application of military law had resulted in injustices to civilians.

The problem was crystallized on February 25 when the United States Supreme Court ruled that the military courts established under martial law had no power to try civilians. In the majority opinion, Justice Hugo L. Black found that Congress, in approving the Hawaiian Organic Act, intended the military to act vigorously and maintain orderly civil government in defending the Islands against invasion, but did "not intend to authorize the supplanting of courts by military tribunals."

A series of Tidal waves, crossing the Pacific Ocean in a 4,000 mile sweep, struck Hawaii on April 1, causing at least 205 deaths. During the Summer the United States Congress approved legislation authorizing Federal financial aid in rehabilitating of tidal wave damage, estimated at \$25,000,000.

With the end of the war, a struggle between organized labor and the Hawaiian Sugar Planters' Association over wages and working conditions developed into a problem that was felt in all aspects of Hawaii's economy. When negotiations between the International Longshoremen's and Warehousemen's Union (C.I.O.) broke down, 26,000 plantation workers struck on September 1 on the thirty-three plantations that comprise Hawaii's sugar industry. The union demands included a 65-cent minimum wage, 40-hour week, and union shop.

After several weeks of negotiations, agreement was reached on November 15 that provided for a minimum gross wage of 70½ cents an hour for the plantation workers. The 48-hour week was retained and the question of the union shop was by-passed in favor of union security provisions which were carried in the old contract that expired on August 1. The agreement gave every worker a net wage gain of at least 18½ cents an hour.

In the national elections held on November 5 the Republicans retained control of the Hawaiian legislature and Joseph F. Farrington was re-elected as Delegate to the United States Congress on the Republican ticket. John H. Wilson, Democrat, who was supported by the C. I. O. Political Action Committee, defeated the Republican candidate, Herbert M. Richards, in the Honolulu mayoralty contest.

**HAYDEN FOUNDATION, Charles.** A charitable institution, established in 1937 to assist needy boys and young men to attain moral, mental, intellectual, and physical well-being through providing scholarships and aiding educational institutions; through building, assisting, or equipping clubs, gymnasias, and recreation centers; and through aiding hospitals.

The trustees are empowered to use the income or the principal of the fund in the furtherance of other charitable or educational projects as contemplated in Mr. Hayden's will. The will directs that in the disposition of the funds, preference be given to the activities of the Foundation within New York City and Boston, although it also provides that work may extend to other places in the United States.

The Founder was particularly interested in boys' clubs, therefore, the Trustees confine present activities to that work and limit grants-in-aid to organizations operating in New York and Boston. Trustees: J. Willard Hayden, President; Edgar A. Doubleday, Executive Vice President and Treasurer; Erle V. Daveler, Vice President. Office of the President: 85 Water Street, Boston 7, Massachusetts. Administrative Office: 25 Broad Street, New York 4, New York. The total capital assets are approximately \$45,000,000.

**HEATING AND VENTILATING.** A United States Weather Bureau official reported in mid-year that the trend toward warmer winters in the United States which began about 1905 apparently reversed about 1938 and that we are now on the upward scale of a cycle tending not only toward colder winters, but cooler summers—a trend of considerable interest to heating, fuel, and air conditioning interests. A 9 percent saving in heat requirements, resulting from taking advantage of the sun's heat, was shown by research conducted at Purdue University, where two houses were tested, identical, excepting that one had 12 percent of wall area in glass while the other had 22 percent of wall area in glass to allow solar heat to enter. Foreign interest in solar heat was reported from Russia, where a mirror installation which captures the sun's rays has developed boiler steam pressures of 29 pounds per square inch during a 30 minute demonstration at a Russian preserve factory. Additional heliostats are being built in that country.

A strike of Pittsburgh's electric utility workers created an unusual situation in the fall because downtown Pittsburgh is largely heated by steam provided by the Allegheny County Steam Heating Company, whose workers belong to the same union and were also on strike. Emergency boilers were set up in the streets in front of several large store and office buildings. Tests made in Detroit early in the year in an office building indicated that steam savings up to 25 percent where possible when steam was shut off at night, as compared to allowing steam to remain on during the time when the building was not occupied.

An installation intended to provide answers to certain problems in regard to radiant heating was made in the new plant of the A. O. Smith Corp. in Kankakee, Illinois. Forty miles of piping including wrought iron, copper, and steel were laid in the floors in several dozen separate systems. Radiant heating was provided for the new Martin 202 airliner in mid-year. Several additional companies brought out baseboard radiators designed to replace the conventional baseboard, the objective being to make the heating element practically invisible.

Reports from Great Britain indicate that research is being conducted on the use of metallic wall paper to prevent the escape of heat. Radiant energy striking the metallic surface is reflected back into the room. The time taken for the wall surface to reach a given temperature would be reduced between 20 and 60 minutes by the use of such material. Conversely, insulation buried in the interior of the wall was said to have little effect on the rapidity of warming the room. An electric cable intended for radiant heating and which is simply buried in the plaster of a room is being used in the Pacific northwest. This cable has also been used in decorative screens, the radiant energy tending to heat the adjacent space; these methods are practicable where electrical energy is available at low cost.

New Zealand is reported as studying its Rotorua thermal regions to determine what use can be made of the heat available from underground volcanic springs.

Coal burning hand-fired furnaces and stoves that are virtually smokeless will be available in 1948, according to a prediction made by the University of Illinois. Early in the fall of 1946, the National Coal Association began organization of a Better Home Heating service plan under which coal dealers would set up facilities for serving their customers on a twenty-four hour basis. Funds for financing the program will come from the retailers and will be financed by the National Coal Association up to two cents per ton.

A utility unit which comes as a package and which provides space and water heating, plumbing, refrigeration, kitchen and bathroom facilities, was placed on the market by Borg Warner and installed in test homes in Kalamazoo during the summer.

Gas made rapid strides in heating during the year and to such an extent that numbers of large utilities such as those in and around New York, Rochester, and Buffalo proposed to deny all applications for house heating service using gas due to the fact that the capacity of their mains on peak load days had been reached. Another index of this trend was revealed in a study of the heating and fuel plants for 629,000 dwelling units built for the Veteran's Emergency Housing Program, which showed that gas leads in the choice of builders for fuel for heating, 52 percent of the plans calling for this fuel. Coal accounted for 27 percent and oil the remaining 21 percent of the houses.

Further progress was made in the development of the heat pump—a refrigerating unit used for both heating and cooling of buildings—when American Gas and Electric Service Corporation sponsored meetings of electric utility companies throughout the country at which it was proposed that the utilities purchase 1,000 such heat pumps for house heating and cooling, and 10,000 units for heating hot water, all of which would use the reverse cycle heat pump principle. As part of its Small Homes Research program, the University of Illinois completed a one-story five and a half room, modern home in which studies of warm air heating will be made. The Bureau of Mines announced development of a stoker-fired hot water heater for houses which can supply hot water for a month at a cost less than one dollar. It burns sub-bituminous coal.

Following the installation of a modern ventilating system in a large foundry in Cleveland, it was found that labor turnover was reduced from 20 percent to 6 percent per month. Fifty-three fans capable of supplying and removing 25,000 tons of

air per hour will ventilate the new Brooklyn-Battery tunnel in New York City, it was reported in September. (Also see AIR CONDITIONING AND REFRIGERATION.)

CLIFFORD STROCK.

**HECKSCHER FOUNDATION FOR CHILDREN.** An organization founded by August Heckscher (1848-1941) to promote the welfare of children. The Foundation was incorporated March 15, 1921 and occupies a building at 346 West 89 Street, New York 24, N.Y. It maintains benevolent, educational, recreational and welfare activities. It sponsors a Heckscher Children's Symphony Orchestra, composed of sixty young musicians from the ages of seven to seventeen, which gives Concerts five times a year with free admission to the public. It provides scholarships for deserving children talented in cultural arts; it provides milk, clothing and financial aid to children of families referred to it by other organizations.

**HOCKEY.** Montreal's Canadiens returned to the highest spot in professional hockey last season, when they roared through to their third straight championship in the National League race and maintained their fast play through the Stanley Cup series to capture the sport's most coveted prize for the second time in three years.

The Flying Frenchmen routed the Chicago Black Hawks in four straight contests in the semifinal playoffs for the cup, while Boston's Bruins were winning four out of five games with Detroit, to enter the ultimate round. Paced by their stellar captain, Toe Blake, the Canadiens defeated the Bruins, 4-3, 3-2, 4-2, 6-3 to regain the cup they had relinquished to Toronto the previous season. Although Boston waged a bitter fight in the series, forcing the champions to three overtime games, it was able to win only the fourth contest, and that in an extra period, by a score of 3-2.

Much of the credit for Montreal's high ranking was due to the cool defensive work of Bill Durnan, who won the Vezina Trophy, annual award to the league goalie with the lowest number of goals scored against him. Handicapped by injuries that kept him out of ten contests at midseason, Durnan allowed 104 goals for an average of only 2.6 per game and turned in four shutouts in 40 contests.

The Lady Byng Trophy for good sportsmanship and high standard of play was won by the popular Toe Blake, while Max Bentley of Chicago, the circuit's top scorer with 61 points, annexed the Hart Trophy, most valuable player prize. Although hampered by injuries, Bentley tallied 31 goals and 30 assists to beat Gaye Stewart of Toronto who had 52 points. The Calder Memorial Trophy, granted to the year's outstanding rookie, went to Edgar Laprade of the New York Rangers.

Although the league failed to produce its pre-war standard of play there was a continual gain in attendance around the circuit and the Stanley Cup playoffs resulted in a record pool of \$90,160 that was divided among the four competing teams.

Laurels in the Eastern League were won by the Boston Olympics for the third straight season, but the Olympics lost to the Vancouver Canucks in the playoffs for the Walter E. A. Brown Trophy, emblematic of the United States amateur championship. Buffalo's Bisons took American League honors for the third time in four years, and the Manhattan Arrows annexed the Metropolitan Amateur League crown, although they were upset by the Brooklyn Torpedoes in a series for the

Lester Patrick Trophy after the regular campaign.

The 1945-46 season saw the retirement of Mervyn (Red) Dutton as President of the National League. Dutton, whose long career as player, manager, and league head made him one of the most colorful figures in hockey history, was succeeded by Clarence Campbell, young Alberta lawyer.

THOMAS V. HANEY.

**HONDURAS.** A Central American republic. Area: 59,161 square miles. Population: 1,201,310 (1945). Capital: Tegucigalpa.

The land surface of Honduras is largely mountainous, except for the southern coastal lowland and a few deep river valleys in the north. Most of the settled areas in the highlands range from 3,000 to 4,500 feet in elevation. The northern half of the country is wet and tropical; the south and southwest have tropical dry-winter climate.

**The People.** About 86 percent of the total population of Honduras are mestizos; the rest are divided among Indians (9 percent), Negroes (2.2 percent), and persons of European descent (1.8 percent). The Indians live in the highlands; the negroes on the north coast. Highest population density is in the southwest. The largest cities are Tegucigalpa, 47,200; San Pedro Sula, 20,400; and La Ceiba, 11,300.

Spanish is the official language, Roman Catholicism the prevailing religion.

It is estimated that 52.2 percent of the persons over 7 years of age are illiterate. In 1945 there were 61,806 students in primary schools; 2,826 students enrolled in 22 intermediate schools; and 467 students in the Central University.

**National Economy.** Honduras has an agricultural economy. The chief export crops are bananas and coffee. Other export crops are: tobacco, citrus fruits, coconuts and copra, citronella, and loofa sponges. Production of abaca was begun in 1944. Domestic food crops include: corn, beans, and rice. Cattle-raising supplies meat for the domestic market and the most important export to countries other than the U.S. Honduras also exports forest products, chiefly mahogany, pine, crude rubber, liquidambar and turpentine. Gold and silver are the most valuable mineral exports.

Small manufacturing establishments supply the domestic market with such articles as cotton goods, yarns, cigarettes, matches, soap, and candles.

**Foreign Trade.** Honduran exports and imports attained almost prewar levels in 1944-45, merchandise trade being valued at \$25,440,556. The total value of exports was \$12,133,070, of which bananas and precious metals accounted for 53 percent. More than 83 percent of total exports for 1944-45 were shipped to the U.S. During 1945, banana exports totaled 12,906,716 stems. Coffee exports to the United States amounted to 6,000,000 pounds. Other significant export items for 1945 were: gold bullion valued at \$740,199; silver valued at \$1,374,857; 63,089 pounds of loofa sponges; 13,799,114 pounds of coconuts.

The value of merchandise imports during the fiscal year 1944-45 totaled \$13,247,486. The U.S. supplied imports totaling about 66 percent of the total; El Salvador provided about 7 percent, and Mexico 7 percent.

**Government.** The Constitution of 1936 provides for a centralized republic of 17 departments and 1 territory, and a unicameral National Congress of 45 members. The Congress meets in regular session on Dec. 5 each year for 60 to 100 days. The President and members of Congress are directly elected

for 6-year terms, and the President may not succeed himself in office. He is aided by a Cabinet of 6 ministers. General Tiburcio Carías Andino became President in 1933 for a 4-year term which was extended to Jan. 1, 1943, and later to Jan. 1, 1949, by constitutional amendment.

**Events, 1946.** After the Honduran Congress on January 22 lifted the state of siege that existed since January 3, 1941, it was reported that several newspapers criticized the policies of President Carías. In retaliation the President reportedly ordered the arrest of many newspaper editors. Several editors who escaped to Guatemala alleged that Abraham Cunera and Adolfo Miralda, editors of *El Libertador* and *La Tribuna*, both of La Ceiba, were arrested. It appeared that President Carías was attempting to prohibit any opposition to his regime from taking root in Honduras.

On March 7 the Congress approved legislation forbidding foreigners to engage in "totalitarian or anti-social" activities.

The first International Congress of Caribbean Archaeologists met in Tegucigalpa on August 1 and held additional sessions in Comayagua, San Pedro Sula and Copan.

In May the military attaché of the United States Embassy in Tegucigalpa awarded medals to several members of the Honduran Air Force for patrol work in the Atlantic area during the war.

**HONG KONG.** A British crown colony in southeastern China at the mouth of the Canton River. It consists of the island of Hong Kong (area about 32 square miles), the Kowloon peninsula and the New Territories. Total area of colony, 391 square miles. Population in 1940, exclusive of refugees from China, 1,071,893, of whom all but 24,125 were Chinese. The island surrendered to the Japanese December 26, 1941, and was reoccupied August 30, 1945.

The colony is administered by a governor, assisted by an executive council and a legislative council of 18 members. When Sir Mark Young reassumed office as civil Governor on May 1, 1946, succeeding Vice Admiral Sir Cecil Harcourt, military Governor, he announced that the British Government intended to revise the colony's constitution in such a way as to permit a greater measure of self-government.

The Governor, after consultations, subsequently formulated a proposal for a municipal council of 48 members, one-half of whom would be Chinese. The Hong Kong Chamber of Commerce, however, proposed a council of 16 members, apparently to blend Chinese membership with the original European element as the Shanghai Municipal Council had done for many years in the International Settlement.

**Reconstruction Problems.** Several grave economic and social problems remained after Hong Kong had been reoccupied and assumed the outward appearance of prosperity. There was a severe shortage of rice and the Government had to fix a low rice ration. Currency inflation appeared, although the Hong Kong dollar was nominally pegged to sterling, bringing black markets with it. Strikes and other labor troubles were common in 1946.

There was a flight of capital to Hong Kong, and of thousands of Chinese, both rich and poor, as well. The poorer classes appeared to be attracted by the rice ration and by Hong Kong's employment opportunities in comparison with Canton. The wealthy sought the comparative security of the British flag, under which they could live untaxed, with the opportunity of buying luxuries. Housing

and transportation facilities were far less than adequate for the growing population.

**Trade Revival.** Trade is the life of Hong Kong, which has been a free port and a port of call for ship lines operating across the Pacific. In spite of many difficulties, such as that of obtaining textiles, in the first nine months of 1946 imports from all countries were \$110,750,000, as compared with \$40,000,000 in the corresponding period in 1939, and exports were \$97,750,000 (\$42,500,000 in 1939). American goods formed more than one-half of the imports.

The fishing industry, which was harshly treated by the Japanese because of its part in maintaining communications with Free China, has shown remarkable recuperative powers. Junks had been destroyed and much of the fishing population disappeared. After reoccupation, the Military Government furnished loans to junkmasters. Later a wholesale market was established and a Fisheries Cooperative set up. The number of junks has increased from 283 at the time of reoccupation to more than 5,000 in 1946.

ALZADA COMSTOCK.

**HOSPITALIZATION, Federal Board of.** An advisory Board of the U.S. Government, organized in 1921 to coordinate the hospitalization activities of the medical branches of the Army and Navy, the U.S. Public Health Service, the U.S. Veteran's Administration, St. Elizabeth's Hospital, and the Commissioner of Indian Affairs. On May 7, 1943, it was also designated as an advisory agency to the Bureau of the Budget. It has been charged with the development of a complete over-all program for providing hospitalization for the veterans of World War II. Chairman: James E. Webb.

**HOWLAND ISLAND.** A mid-Pacific island (0° 49' N. and 176° 40' W.), belonging to the United States. It lies athwart the main steamship lanes and the Pan American Airways route from Honolulu to New Zealand and Australia. An aerological station was established during 1936 by the United States Dept. of the Interior.

**HUMAN NUTRITION AND HOME ECONOMICS, Bureau of.** A Bureau of the U.S. Department of Agriculture, established as the Office of Home Economics in 1923. To meet the demand of American families for scientific facts to aid them in the best use of their resources, the Bureau conducts research on food, fiber and other products of agriculture contributing to everyday living, and on economic problems that affect rural family living. Chief: Hazel K. Stiebeling.

**HUNGARY.** A state in central Europe. Area: 35,875 square miles (1938 estimate). Population: 9,108,252 (1938 estimate). Chief cities (with November 9, 1939, population figures): Budapest (the capital) 1,115,877, Szeged 131,893, Debrecen 122,517, Kolozsvár 100,844, Kecskemét 83,732, Nagyvárad 82,687, Miskolc 73,503, Újpest 72,940. *Education and Religion.* See YEAR BOOK for 1944.

*Production, Foreign Trade, etc.* For Hungary's economic situation before and during World War II see YEAR BOOK for 1944, *Statistical Year-Book of the League of Nations, 1942/44*, and *Foreign Commerce Weekly*, Mar. 17 and 31, 1945 (U.S. Dept. of Commerce, Washington, D.C.).

*Finance.* Budget estimates (1944, including estimates of revenue and expenditure for annexed territories which were evacuated by Hungary on Jan. 20, 1945): revenue 5,866,700,000 pengő; ex-

penditure 6,147,100,000 pengő. The public debt increased from 1,937,400,000 pengő on June 30, 1939, to 6,501,000,000 pengő on Dec. 31, 1943. For the year 1944 the service of the public debt required 363,800,000 pengő. It was reported in the press that notes in circulation totaled 106,000,000,000 pengő on Oct. 30, 1945.

**Government.** After the November 4, 1945, elections that gave the Smallholders party a majority in the legislature, a coalition Government was formed, giving the Smallholders party nine portfolios, the Communists four, the Social Democrats four, and the National Peasants one. In the meeting of the National Assembly, on February 1, 1946, during which Hungary was declared a Republic, Dr. Zoltan Tildy, leader of the Smallholders party, was elected President.

**Events: New Republic.** In mid-January of 1946 Premier Zoltan Tildy, baron, Calvinist clergyman, and leader of the Small Landowners' Party which won the elections of November 4, 1945, announced to the world that Hungary would become a republic with a constitution guaranteeing popular liberties. On February 1 the National Assembly proclaimed the end of the thousand-year-old Magyar monarchy and elected Tildy to the Presidency for a four-year term. His new post was comparable in its powers to that of the British Sovereign or French President rather than to that of the Chief Executive of the United States.

Communist leader and Deputy-Premier Matthias Rakosi became interim Premier, but was immediately replaced by Ferenc Nagy, also of the Small Landowners' Party, who held the premiership during the balance of the year. The end of the old order was symbolized by the execution on February 28 of ex-Premier Bela Imredy (see YEAR BOOK for 1945, p. 262) and by the return to private life, on his country estate near Munich, of ex-Regent Horthy, following his release on January 2 from a Nuremberg jail where he had been held as a possible prosecution witness in the trial of war criminals. The aging Regent was not brought to trial for his own crimes. The kingless kingdom which he had helped bring to ruin returned in 1946 to the republican tradition of 1918 and 1948.

**Politics: Between Vatican and Kremlin.** Predominantly Catholic Hungary, occupied by Soviet armies, remained poised in uneasy balance between two poles. Rome was locally represented by Primate Joseph Cardinal Mindszenty, foe of agrarian reform, who joined his fellow-Cardinals in Vatican City for the ceremonies of mid-February. Moscow was represented initially by Marshal Voroshilov and later by Lt. Gen. V. P. Sviridov, Chairman of the Allied Control Council. The Communist Party retained control of the Deputy Premiership (Rakosi), the Ministries of Communications (Ernst Gero), Social Welfare (Erik Molnar) and Interior (Ladislav Rajk) and the Secretaryship (Zoltan Vas) of the six-man Supreme Economic Council. Attacks upon the latter body, coupled with "chauvinist" demands for frontier revision, on the part of Dezső Sulyok led to his expulsion in April from the Small Landowners' Party under pressure from the Left. His efforts to form a new "Hungarian Freedom Party" were temporarily frustrated by the Soviet authorities, though his opposition group was functioning, albeit without notable success, by the close of the year.

Soviet forces in Hungary were substantially reduced by summer, but Moscow's concern with Magyar politics was not thereby diminished. In a note of June 28 Lt. Gen. Sviridov demanded the suppression of three Catholic youth organizations

and of the Boy Scouts; the permanent exclusion of Count Dessewffy and György Parragi from journalism; the lifting of parliamentary immunity of two deputies, Gyulay and Filler, charged with anti-Soviet agitation; the dismissal of various other minor officials; and the cessation of anti-Russian propaganda within the Catholic Church. The individuals and organizations thus denounced were all accused of "Fascist" activities.

The American and British members of the Control Council protested against these demands, but Premier Nagy yielded to them on July 11, perhaps fearing that rejection would lead to the ousting of his Cabinet in favor of a Communist-Socialist regime. On September 5 Cardinal Mindszenty accused the government of failing to "defend the honor of the Catholic Church" and threatened to "impose with the spiritual power of the church severe punishments upon those who decreed and implemented dissolution of the Catholic associations."

Just as the "Third Rome" (i.e. Muscovy) triumphed over the First in this contest of wills, so Soviet determination to destroy the remnants of Magyar feudalism produced a fundamental alteration in the structure of Hungarian agriculture. The old ruling class of rural magnates was liquidated with the distribution of their estates during 1945-46 among some 800,000 peasants. This fragmentation of large holdings, however, threatened a decline of grain production and posed two alternatives: collectivization on the Soviet model or intensive garden farming on the Dutch and Danish models, with emphasis on vegetables and dairy products. The latter choice seemed certain to prevail in view of the determination of the Government and the peasant leaders to base the new Hungary on small independent proprietors. This development foreshadowed the withdrawal of Hungary from the European and world wheat market, but promised an ultimately higher standard of life for the peasants than they had known in the past.

**Inflation and Stabilization.** All Hungarians suffered during 1946 from the collapse of their currency. By early April an American dollar was worth 1,000,000 pengő officially and 20,000,000 pengő on the black market. Hungarians able to obtain foreign currency enjoyed a life of luxury at fantastically low costs. Others, meaning most of the population, faced starvation as price levels and printing presses engaged in a mad race. In late June the Cabinet inaugurated a new system of wage and price controls. By mid-summer the pengő had become worthless in the culmination of a runaway inflation of astronomical proportions.

On August 5 the Government introduced a new currency based on the forint (pegged at 11.73 to the dollar) which was backed by \$32,000,000 in gold, stolen by the Nazis and restored to Budapest by the American authorities in Germany. While this decision put an end to the inflationary nightmare, it led to high prices, low wages and increasing unemployment. Erstwhile speculators were impoverished, but workers and salaried employees were reduced anew to a desperation which could scarcely be alleviated without extensive foreign assistance and a restoration of productivity and international trade.

**Diplomacy: Between Washington and Moscow.** Hungarian efforts to salvage something from the wreckage of defeat and to find the means of a new national life were inevitably conditioned by the relations between the United States and the U.S.S.R. Along with Italy, Finland, Rumania, and Bulgaria,

Hungary attained no peace treaty during 1946 because of the protracted diplomatic duel between the Soviet Union and the Atlantic Powers. Late in January the Red Army took control of the Lisse oil fields in western Hungary, including the properties owned by Standard Oil. June found Nagy in Washington, along with Vice-Premier Rakosi, Minister of Justice Stephen Riesz and Foreign Minister Janos Gyoengyoessy. But Magyar hopes of obtaining more lenient peace terms though playing off Moscow and Washington against one another were frustrated by the inescapable facts of Soviet occupation and American unwillingness to risk war in any effort to expel the Muscovites from the Danube basin.

Under these circumstances Hungary was less a subject of diplomacy than an object of American-Soviet quarrels. On March 2 the State Department protested to Moscow that Soviet reparations, requisitions and occupation costs were impoverishing Hungary and asked for concerted efforts to restore Magyar economy. On April 21 Vishinsky replied with a refusal, a general disclaimer, and a counter-accusation that American retention in Austria and Germany of Hungarian displaced property valued at \$3,000,000,000 was chiefly responsible for Hungary's plight. On July 22 Ambassador Walter Bedell Smith delivered a note to Molotov, denying the Soviet allegation and itemizing the alleged burdens upon Hungary of the Soviet occupation. On July 27 Moscow dismissed these charges as "completely groundless," rejected the American figures, made further counter-accusations, and again declined to cooperate in any joint Anglo-American-Soviet plan for Hungarian rehabilitation. On September 21 the United States reiterated its position.

This debate of the titans was wholly inconclusive both as to the facts and as to responsibility for Magyar miseries. Immediate publication of the notes by both sides suggested that each was "playing to the gallery" and had no hope of an accord. Budapest derived little comfort from the spectacle, since diplomatic notes are notoriously deficient as a source either of nourishment or entertainment.

**Reparations.** In the protracted process of Allied peace-making with the Axis satellites, via Council of Foreign Ministers, Paris Peace Conference and Council once more, the Hungarian Government was eager to reduce, if possible, the reparations bill imposed in the armistice terms of January 20, 1945. On April 6, 1946 a new accord between Budapest and Prague, Belgrade and Moscow reiterated the original demands: \$300,000,000 to be paid in kind over six years, with two-thirds going to the U.S.S.R., \$70,000,000 to Yugoslavia and \$30,000,000 to Czechoslovakia. The same terms were incorporated in the draft treaty with Hungary prepared by the Council of Foreign Ministers. Following the establishment of joint Hungarian-Soviet companies in the fields of shipping, civil aviation, oil and aluminum, and talks in Moscow between Nagy, Molotov and Stalin, the Soviet Union agreed on April 18 to extend by two years the period of Hungarian payments.

After the Washington discussions of June with Truman, Byrnes, and Acheson, Nagy received assurances that the United States would restore to Hungary various assets taken by the Nazis during the war, including the \$32,000,000 gold reserve, 260 factories, 540 Danube river ships, etc. While Hungarian estimates of the value of displaced assets ran as high as \$3,500,000,000, the goods actually restored amounted to little more than \$100.-

000,000. At the Paris Peace Conference an American proposal that Hungary's total reparations be reduced to \$200,000,000 was voted down early in October. Hungarian appeals for reconsideration were vain. The peace treaty completed in New York in December and scheduled to be signed in Paris in February, 1947, contained the original program of payments.

**Frontiers.** Budapest was equally unsuccessful in its efforts to modify the frontiers of the Treaty of Trianon (1919) as reaffirmed in the armistice of 1945 with its reference to the boundaries of 1937. In the Moscow negotiations of April, Molotov sympathized with guarantees of minority rights for Magyars in neighboring States, but declined to put any pressure on Bucharest, Prague or Belgrade for frontier revision on the ground that this must be settled by the Great Powers. Anglo-American support for Hungarian aspirations was insufficient to produce results. Premier Nagy told the Hungarian press on June 26 that the nation must forget the revisionist agitation of the preceding 25 years.

On September 5 Nagy left Paris in disappointment after the Rumanian Commission of the Peace Conference voted to approve the old borders as drawn in the draft treaty. Budapest was further obliged to cede to Czechoslovakia a small bridgehead south of Bratislava. The only Hungarian "victory" in the peace negotiations was purely negative. It consisted of Prague's acquiescence in the decision of the Powers that Czechoslovakia should not expel 200,000 Magyars in addition to the 100,000 to be exchanged for an equal number of Slovaks in Hungary.

**Horizons of Peace.** The treaty to be signed in Paris in February, 1947, was laden with the bitter fruits of Hungary's espousal of the cause of the Fascist Axis. The victorious Soviet armies of occupation would be withdrawn in its aftermath. But Hungary, for better or for worse, would long remain within the Muscovite orbit, surrounded by Soviet allies. This circumstance inevitably reduced to despair all ultra-montane Catholics, all expansionist super-patriots, most members of the old elites of land and money, and many earnest liberals and democrats of all classes. But it was no source of sorrow to Hungary's workers or to its long-degraded peasantry. The ancient institutions of feudalism and monarchism, for centuries the matrix of Magyar glory and Magyar woe, were at long last gone without regret by most Hungarians. The life of the days to come, for all its hardships and humiliations, might well see a new birth of freedom, dignity and well-being for the common man such as he had never known in years gone by.

See CZECHOSLOVAKIA, PARIS PEACE CONFERENCE, RUMANIA, U.S.S.R. and VATICAN CITY, YUGOSLAVIA.

FREDERICK L. SCHUMAN.

**ICELAND.** An island republic in the North Atlantic, situated 200 miles east of Greenland and about 540 miles northwest of Scotland. Area, 39,709 square miles only one-fourth of which is habitable. Population in 1945, 127,770. Populations of the chief towns: Reykjavik (capital), 44,281 inhabitants in 1945; Akureyri, 5,939; Hafnarfjörður, 4,050.

**Government.** The Constitution of May 18, 1920, (amended in 1934 and 1941) provided for a constitutional monarchy. The King of Denmark exercised executive power through a responsible Cabinet. Legislative power rested conjointly with the King and the Althing, the oldest parliament in the world, established 930 A.D. The Althing consists of 52 elected members. One third of its members are

elected to the upper chamber by the whole Althing; the other two-thirds form the lower chamber.

On Apr. 10, 1940, the Althing authorized the Government temporarily to exercise the sovereign powers vested in King Christian X and to assume full charge of Iceland's foreign affairs, previously conducted by Denmark under the Act of Union. The Althing on May 16, 1941, adopted various constitutional amendments with a view to establishing an independent republic upon expiration of the Act of Union in 1943. Sveinn Björnsson, former Icelandic Minister to Denmark, was elected Regent on June 17, 1941. After the proclamation of the republic on June 17, 1944, Björnsson became President. Chosen by the Althing for a one-year term, he was reelected on June 7, 1945, for a four-year term from August 1, 1945.

**Events.** Icelandic affairs in 1946 were dominated completely by one issue of international importance: that of the American wartime bases on the island. This was not only a matter between the Governments of the United States and Iceland, but also an important point in the world-wide diplomatic struggle between Washington and Moscow, which marked the year.

In the early months of 1946, the issue was still beclouded by secrecy and speculation. Rumors and propagandistic statements were rife. Late in January an American news agency gave wide circulation to a report from Copenhagen that Russia had approached the Icelandic Government with a request to lease a base at Seydisfjord on the east coast of Iceland. On February 2, the Soviet news agency TASS formally denied the story. At the same time Russian newspapers renewed their attacks on the continued presence of American military and naval forces in Iceland.

On March 21 Secretary of Commerce, Henry A. Wallace, expressed the view that United States troops should be withdrawn from Iceland. Referring to the withdrawal of Soviet forces from the Danish island of Bornholm, he said: "The only interpretation the Russians could place on continued occupancy of bases in Iceland by American troops would be that it was aimed at them."

On April 5, the Moscow newspaper *Izvestia* wrote: "That American troops do not intend quitting Iceland in the near future is proved by the fact that the command of the American garrison is concluding agreements with Icelandic farmers for renting plots of land . . . in the proximity of airfields and the naval base." (New York Times, April 6, 1946). This story was promptly denied by Washington officials and also by the Icelandic Minister to the United States, Thor Thors, who pointed out that "it is contrary to Icelandic law to sell real estate" to foreigners.

The whole matter was at last brought out into the open by an official statement issued on April 26 by the Icelandic Premier Olafur Thors. The statement said that the United States, on October 1, 1945, had approached the Icelandic Government with a request for discussing a long-term lease of military bases on the island by the United States. At the same time, Mr. Thors declared, Washington had informed him that the United States emphatically would support Iceland's application for membership in the United Nations. He added that the American proposals assumed that when and if Iceland joined the United Nations, any bases acquired by the United States on the island would become available to the Security Council in fulfillment of possible Icelandic obligations under the United Nations Charter. The United States also assured Iceland that she would use the rights she might

acquire with full respect for the independence and sovereignty of the Republic of Iceland and without intervention in Iceland's affairs.

Iceland turned down these proposals, Mr. Thors disclosed. The rejection was made in a note delivered to the American Minister in Reykjavik, on November 6, 1945. In December, the United States Government consented to put aside the question for some time, Mr. Thors added. The State Department, on April 27, confirmed the foregoing in all details and reiterated its promise that "the limited military personnel still in Iceland will be withdrawn, and Meeks (Keflavik) Field turned over to the Icelandic Government," when the war officially ended with the coming into force of peace treaties.

This promise, however, did not satisfy the Icelanders, who had no way of knowing when the war would end "officially," and could do nothing to speed the conclusion of peace treaties. Nor did it satisfy the Russians, who in May launched another concerted propaganda campaign against the United States' request for bases in Iceland.

At the same time, and in apparent connection with the political pressure exerted, the Russians offered to Iceland a very favorable trade agreement, which was concluded on May 27 in Moscow. Under the terms of this treaty, the Soviet Government undertook to purchase a major portion of Iceland's fish catch and fish products at prices estimated to be 30 to 50 percent higher than those previously paid by American and British buyers. In return, Iceland would receive Russian coal and timber, with a large balance to be paid in American dollars.

The question of the American forces still stationed in Iceland was raised again when the Althing, on July 25, voted to apply for membership in the United Nations. An amendment, that would have made the application contingent upon the immediate withdrawal of the United States troops was defeated 36 to 9, after a statement by Premier Thors that negotiations to that end were about to begin.

In the midst of this confused diplomatic situation, a general election was held on June 30. The result showed little difference from the preceding election. The Progressives, the only opposition party, lost two seats to the Social-Democrats. The returns are given in the accompanying table.

ALTHING ELECTION, JUNE 30, 1946

Party	Votes	Seats
Independence Party (Conservatives)	26,428	20
Progressives	15,072	13
Communists	13,049	10
Social-Democrats	11,911	9

On September 19, the United States, in a new note to Iceland, formally proposed to withdraw all its armed forces from the country within 180 days; to transfer the airfields of the Keflavik area to the Government of Iceland; and to agree to the abrogation of the defense agreement of July 1, 1941. The note requested, however, that the Keflavik airport "continue to be available for use by aircraft operated by or on behalf of the Government of the United States in connection with the fulfillment of United States obligations to maintain control agencies in Germany." This, of course, included the use of the airfield by American military planes.

The Icelandic Government accepted these proposals over the opposition of its two Communist members. The Communist newspaper in Reykjavik saw in the proposed agreement an American bid for a camouflaged military base. On September 22, street demonstrations and rioting broke out in Reykjavik, as the Communists organized protest

actions against the agreement. The Reykjavik Trade Union Council called a 24-hour general strike. Premier Thors, in an angry statement, declared that "the rule of the fist" would not be allowed to govern in Iceland; he was booed and even threatened by Communist mobs.

On October 5 the Althing, by a vote of 32 to 19, ratified the agreement, which thereby went into effect immediately. In addition to the ten Communist members, two Social-Democrats and seven Progressives opposed the agreement; all twenty Conservatives, including the Premier, six Social-Democrats, and six Progressives voted for it, with one Social-Democrat abstaining.

In further protest against the treaty, the Communists withdrew their two representatives from the six-man Cabinet, causing Premier Thors to resign on October 10. However, at the request of President Sveinn Björnsson, the Communists, the following day, agreed to continue to sit in a caretaker government until a new Cabinet could be formed.

The evacuation of American military personnel, of whom about 1,000 had remained in Iceland, began on October 23. Two days later, the Keflavik airport, which the Americans had built during the war at an estimated cost of \$5,000,000, was solemnly turned over to Icelandic authorities.

In the meantime, Iceland's application for membership in the United Nations had been approved unanimously by the Security Council on August 29, and by the General Assembly on November 9.

**Production.** Fishing is the chief industry; it supports nearly 30 percent of the population directly and in 1942 it provided 96 percent of the value of all exports. About 36 percent of the inhabitants live by agriculture, sheep raising, and dairy farming. Potatoes, turnips, and hay are the chief crops. There are very few trees and only low grade coal deposits, but extensive peat deposits are used for fuel and many buildings in Reykjavik are heated by water from hot springs.

**Foreign Trade.** Imports in 1945 averaged 26,478,000 crowns a month, while exports were valued at 23,880,000 crowns monthly. Great Britain and the United States were the chief trading countries.

JOACHIM JOESTEN.

**ILLUMINATION.** The accumulations of the wartime years were reflected in statistics published early in 1946 which indicated that at least 120,000 electric lamps would be needed merely to fill empty sockets in American homes; that a minimum of four million new street lighting fixtures for some 50,000 miles of highways and 250,000 miles of residential streets would be needed for new and replacement traffic-safety lighting in the United States during the next ten years. The estimates of needs for street and highway lighting are based upon survey findings that most of the accidents occur on only 4 percent of some 500,000 miles of designated highways, and on some 10 percent of 300,000 miles of city streets. Automotive, safety, and illumination experts are agreed that adequate lighting of these 50,000 miles of critical streets and highways would reduce materially the accident rate with present levels of vehicle traffic, and keep it under control even with the expected total of some 40 million motor vehicles which are expected to be operating by 1950.

Representative of the progress being made in school lighting is a Cleveland installation of semi-direct luminaires mounted in continuous rows at the proper height to give shielding against direct glare, and to give brightness control, and efficient

light utilization; the working light at the desk-top level being 58 footcandles. This level of illumination, especially in a schoolroom, would be regarded as high on the basis of prewar standards, but on the basis of wartime experience which demonstrated so conclusively the reduction in eye strain and the efficiency in personal work which result from illumination levels of from 50 footcandles upward, now is considered to be practically just the threshold of good practice. Further indication of the trend toward higher levels of illumination was the installation at the famous Yankee stadium in New York City, where some 1,250 1,500-watt lamps were installed to provide an illumination level of 200 footcandles over the 3.5-acre area of the stadium. Improvements in the design of street lighting fixtures, of particular significance in suburban areas where street lights frequently annoy nearby residents, included fixtures which concentrate and guide the light in the direction of the street, a two-way guide for use along the streets, and a four-way guide for use at street intersections.

To provide a service test of adequate proportion to give some conclusive results, the Department of Health of the County of Westchester, New York State, sponsored installation of germicidal lamps in schools, churches, and other public meeting places throughout the village of Pleasantville. Records will be kept and studies will be made covering the effect of these lamps on the incidence and spread of contagious infection in Pleasantville, as compared with another nearby town which is without the germicidal lamps. Manufacturers have perfected various "ultraviolet meters" and other sampling and measuring devices to facilitate the measure of intensities of germicidal radiation. Adaptation of the ultraviolet germicidal lamp has been developed for installation in domestic refrigerators, to produce bactericidal and ozone-creating wave lengths of radiation in the controlled amounts which experiment and experience over several years have indicated to be effective for checking the growth of mold or bacteria on food, killing "ice box" odors, and generally contributing to longer preservation of food in its original state and quality.

Stimulated by the success of their use in wartime industry, fluorescent lighting applications are rapidly growing both in extent and magnitude. For domestic and commercial application, new types of fixtures have been developed to accommodate the ring- or circle-type of fluorescent tubes to floor- and table-lamps as well as for decorative use; fixtures have been developed also simplifying the application of the more slender tubular types of fluorescent lamps, particularly effective for show-case and other specialized lighting, including railway cars and other such installations.

One of the latest revelations of military developments is a "talking lamp," which gives off invisible infrared radiations which were adapted to secret two-way conversation over what is literally an "invisible searchlight" beam. The lamp itself serves as the signal transmitter. Mounted in a parabolic reflector, it picks up words spoken into a microphone and transmits the conversation along the invisible beam of infrared rays to a photo-electric-cell receiving device similarly mounted in a reflector to pick up the rays and convert and amplify them into audible signals. Source of the unseen radiation is caesium vapor, caesium being a metal which is an efficient generator of infrared radiation but which is a very poor producer of visible radiations. The sealed-beam type of lamp which has been used with such outstanding success

as for headlights on motor vehicles during recent years, is finding other applications, such as spotlights for small marine craft or motor vehicles. Spotlights of this type now are available which have a half-mile range. A small mercury-vapor-arc lamp of about the diameter of a cigarette and approximately twice as long produces a light output of 60,000 lumens, which is the equivalent of three times the light output of a conventional 1,000 watt incandescent bulb which would be ten inches or more in diameter.

Among new lamps of interest to photographers is a reflector "photospot" lamp designed for both amateur and professional photography, which lamp is designed to concentrate its light output within a 20-degree beam, thus giving a lighting intensity at the center of the beam some seven times stronger than that of the reflector-type of photoflood lamp. Another photoflash lamp was added to the family of lamps having the new blue filter-coating to give correct lighting values with daylight-type color film. With a good metal reflector, the exposure guide-number for this lamp is approximately 80 for commercial daylight color films of professional type.

Among new lamps for special applications, is a further improvement in the infrared heat lamp, which now combines a built-in reflector, a hard-glass bulb, and a built-in red filter, the combination giving better and safer operation with less glare. This is a 250-watt lamp, designed to fit ordinary household outlets, and probably destined to supplant to some extent the electric heating pad for personal treatment. A new 15-watt-sized lamp has been designed to give 40-watt illumination, for use in domestic electric refrigerators. An illumination level of from fifteen to twenty footcandles has been provided in 150 or so new passenger coaches for the New York Central Railroad, through the installation of 14-watt fluorescent lamps. In Cleveland, a local transit bus has been equipped for experimental operation with 600-volt six-foot cold-cathode fluorescent lamps. For small transport aircraft, a special small tubular lamp of 5¼-inch lengths, to operate at twenty-eight volts with a rating of twenty watts, was announced. As with most equipment and application developments for 1946, hampering restrictions arising from continuing critical shortages in materiel and from unsettled labor, transport, and fuel conditions generally retarded progress during the year to subnormal levels.

G. ROSS HENNINGER.

#### IMMIGRATION, EMIGRATION, AND NATURALIZATION.

The immigration and nationality laws are administered by the Immigration and Naturalization Service of the United States Department of Justice.

**Immigration and Emigration.** During the fiscal year which ended June 30, 1946, 108,721 immigrant aliens were admitted to the United States for permanent residence. This represents a 185 percent increase over the 38,119 immigrants admitted in the previous year, and is the largest number admitted in any year since the fiscal year 1930, when 241,700 immigrants were admitted. Among the immigrants there were 2,551 displaced persons from the American occupation zones in Europe, who were admitted under the President's directive of December 22, 1945. The permissible quota for the year was 153,879, but only 18.9 percent of the quota was filled by the 29,095 quota immigrants admitted. However, this number was two and a half times as many as entered in the fiscal year 1945. A number of countries with small quotas—

Estonia, Greece, Portugal, Rumania, and Spain—practically exhausted their quotas. Of the 79,626 non-quota immigrants, 44,775 were wives of citizen members of the United States armed forces admitted under the Act of December 28, 1945, and 29,396 natives of non-quota countries, chiefly Canada and Mexico. There were 4,492 other relatives of citizens, 534 ministers, professors and their wives and children, and 429 in all other non-quota classes. The number of immigrant aliens admitted, showing the countries in which they last resided, and the number of resident aliens departing for future permanent residence abroad, are shown in Table I.

Aliens admitted for temporary stay and resident aliens returning from a brief sojourn abroad totaled 203,469. This number comprised 17,031 government officials, their employees and families; 134,828 visitors for business or pleasure; 31,124 aliens in transit through the United States; 13,306 returning resident aliens; 5,855 students; 658 members of international organizations; and 669 aliens in other classes. The resumption of tourist travel and rise in the number of returning resident aliens from abroad account in a large measure for the increase of 24 percent over the number of non-immigrants admitted last year.

TABLE I—IMMIGRANT ALIENS ADMITTED AND EMIGRANT ALIENS DEPARTED, FISCAL YEARS 1945 AND 1946, BY COUNTRIES OF LAST OR INTENDED FUTURE PERMANENT RESIDENCE

Countries	Immigrant		Emigrant	
	1945	1946	1945	1946
All countries	38,119	108,721	7,442	18,143

New Zealand	364	898	23	57
Other countries	987	7,372	341	1,110

There were 204,353 aliens who departed during the fiscal year, an increase of 118.9 percent over

the 93,362 of last year. Of those who departed, 18,143 were emigrants, or persons who left a permanent residence in the United States for a stay of at least a year abroad, and 186,210 were non-emigrants, or aliens who had been in the United States for less than a year, or permanent resident aliens who were departing for less than a year.

Aliens seeking admission to the United States who do not meet the requirements for entry are excluded at the ports of entry. During the past year 2,942 aliens seeking admission for 30 days or longer and 2,708 aliens who wished to come in for less than 30 days were excluded. Of those who sought admission to remain for more than 30 days, 71.6 percent were excluded at the Canadian border, 10.6 percent at the Mexican border, and the remainder at the seaports. The Act of September 27, 1944, amended Sec. 3 of the Act of February 5, 1917, so as to exclude "persons who have departed from the jurisdiction of the United States for the purpose of evading or avoiding training or service in the armed forces of the United States during time of war or during a period declared by the President to be a national emergency." Under this provision 21 persons who sought to enter for 30 days or more, were debarred from entering the United States and 12 who sought admission for less than 30 days were excluded.

The greatest volume of travel into and out of the United States from foreign territory occurs at the Canadian and Mexican borders, where aliens and citizens frequently make daily or weekly crossings and recrossings. During the fiscal year 1946 there were 74,240,190 such entries, of which 37,085,718 were by aliens and 37,154,472 were by citizens.

Passengers arriving by air at land and by water at seaports totaled 506,139. Immigrant inspectors boarded 68,445 vessels and 54,903 planes, and in so doing examined 676,038 alien crewmen and 708,643 citizen crewmen. Alien crewmen who deserted numbered 4,365, including 1,115 British, 727 Chinese, and 485 Norwegian.

The continued manpower shortage led to further appropriations for the continuation of the importation of alien laborers from the Western Hemisphere. Recruitment, however, was terminated by the end of the year. On June 30, 1946, there remained in the United States 65,745 agricultural laborers and 3,000 railway track workers. The laborers imported for industrial war work had practically all been returned to their homelands by the end of the fiscal year.

**Deportations and Voluntary Departures.** An unprecedented number of illegal entrants, especially along the Mexican border, who were attracted by the labor shortage and high wages prevailing in the United States, caused a greater number of deportations and voluntary departures of deportable aliens than during any previous year on record. In all, 14,375 aliens were deported and 101,945 aliens who had been adjudged deportable were allowed to depart at their own expense without warrants of deportation. Among them were more than 11,310 Mexican nationals and 90,168 who returned voluntarily across the Mexican border. The principal causes for deportation of aliens under warrants were (a) entry without inspection or by false statements, (b) remaining longer than authorized, and (c) entry of persons who had been previously debarred and deported.

**Border Patrol.** The authorized border patrol officer force of 1,052 at the beginning of the fiscal year 1946 was increased at the end of May to 1,315 officers. These officers patrolled 8,330,947 miles, examined 1,094,268 conveyances, and questioned

4,112,966 persons. They seized and delivered to other appropriate law enforcement agencies 148 automobiles and trucks valued at \$76,933 and recovered 11 such vehicles valued at \$10,023, restoring these to the owners from whom they had been stolen. During the year border patrol officers apprehended 99,591 deportable aliens, more than in any previous year since the patrol was organized in 1924. This represents an increase of 44 percent or 30,427 aliens over last year, and but 747 aliens less than the combined totals of the two preceding years. Patrol officers also apprehended 220 alien smugglers, 84 more than in 1945, and 974 violators of other laws, a decrease of 27 percent over last year. In addition, 821 violators of the Federal Use Stamp Law were referred to the Bureau of Internal Revenue.

**Aliens and Alien Registration.** All aliens remaining in the United States for 29 days or longer are required to register under the provisions of the Alien Registration Act of 1940. The initial registration for aliens began on August 27, 1940, and continued through December 26, 1940. During this period 4,889,770 aliens registered as residents of continental United States. Factors determining the alien population are net immigration, naturalization, and mortality. By using the true figures for immigration and naturalizations, and estimating the alien mortality for the period, it is possible to arrive at the approximate alien population. On such a basis it is estimated that there were approximately 3,000,000 resident aliens in continental United States on June 30, 1946. This estimate does not take into account those here temporarily; that is, non-immigrants, border-crossers, and imported laborers.

**Naturalization.** Naturalization was granted in the United States and overseas to 150,062 persons during the fiscal year ended June 30, 1946. This is a marked decrease from the highest recorded figure of 441,979 persons naturalized in the fiscal year 1944. Of the naturalizations granted in 1946, 134,849 were to civilians. During the year, 6,575 petitions for naturalization were denied; there were 9,782 denied in the fiscal year 1945.

The Second War Powers Act, approved March 27, 1942, made available temporarily, an expeditious naturalization procedure to non-citizens serving in the armed forces of the United States. The statute provided a judicial naturalization process for persons residing within the jurisdiction of a naturalization court, and an administrative naturalization process for those serving abroad. For the fiscal year 1946, 13,159 members of the military and naval forces residing in the United States, Alaska, Hawaii, Puerto Rico, and the Virgin Islands were admitted to citizenship on the basis of petitions filed with naturalization courts. In addition, a total of 2,054 persons serving abroad with the armed forces of the United States were admitted to citizenship by designated representatives of the Immigration and Naturalization Service under the administrative process. Naturalizations were granted in the following areas: Belgium 92; England 77; France 434; Germany 447; Italy 77; other Europe 18; China 49; India 216; Australia 60; Philippine Islands 506; other Pacific 2; all other countries 76. The number of aliens naturalized during the fiscal year 1946, and the principal countries to which such persons owed allegiance, are shown in Table II.

There were 186 naturalizations judicially granted which were revoked during the year, an increase of 21 as compared with the preceding fiscal year. In 162 cases the Foreign Service of the Depart-

ment of State initiated the action because naturalized citizens of this country became permanent residents of foreign countries within five years after naturalization. In 21 cases the Immigration and Naturalization Service initiated action because naturalization was fraudulently or illegally procured, and in three cases, because the persons were dishonorably discharged following naturalization under Sections 701 and 702 of the Nationality Act of 1940.

TABLE II—ALIENS NATURALIZED DURING YEAR ENDED JUNE 30, 1946, BY COUNTRIES OR REGIONS OF FORMER ALLEGIANCE

Countries or Regions of Former Allegiance	Total Naturalized	Civilian	Military	
			In U.S. under Sec. 701	Abroad under Sec. 702
All countries.....	150,062	134,849	13,159	2,054
Austria.....	6,357	6,202	133	22

Union of Soviet Socialist Republics.....	7,404	7,172	201	31
Yugoslavia.....	2,524	2,371	136	17
Other Countries.....	29,745	27,572	1,912	261

Nationality may be lost involuntarily through commission of treason against the United States, or by desertion from the military or naval service of the United States in time of war, if convicted of the offense, or by departure from or remaining outside the jurisdiction of the United States in time of war or national emergency, for the purpose of evading or avoiding training and service in the armed forces of this country. Nationality may also be lost voluntarily through the performance of various acts. In the past fiscal year, 1,113 persons expatriated themselves.

Petitions for naturalization, exclusive of overseas petitions by members of the armed forces, were filed by 123,864 persons. Declarations of intention filed in the fiscal year 1946 dropped to 28,787, the lowest number recorded since 1907, which was the first year in which consolidated statistical records of naturalization were made. There were 31,195 declarations filed in the fiscal year 1945, 42,368 in 1944; and 115,664 in 1943.

**New Legislation.** The Act of December 29, 1945, (International Organizations Immunity Act), authorized the temporary admission of persons designated by foreign governments to serve as their representatives in or to certain international organizations; officers and employees of such organizations; and members of the immediate families of such representatives, officers and employees; and granted them the same privileges, exemptions, and immunities concerning entry into and departure from the United States—alien registration and fingerprinting, and registration of foreign agents—that are accorded officers and employees, respectively, of foreign governments, and members of their families.

The Act of April 30, 1946 (Philippine Trade Act of 1946) provided for the admission to the United States, as non-quota immigrants, of certain citizens of the Philippine Islands who had actually resided in the United States continuously for three years during the period beginning June 1, 1938, and ending November 30, 1941. These benefits also were extended under certain conditions to the

wives and unmarried children under 18 of such Philippine citizens. Application for admission under this Act must be made before July 4, 1951.

Another Act of April 30, 1946 (Philippine Rehabilitation Act of 1946) provided that until June 30, 1950, a limited number of Filipinos may be admitted to the United States temporarily, without regard to the immigration laws except laws relating to alien registration and fingerprinting, for instruction or training under the supervision and at the expense of the United States Government.

The Act of June 29, 1946, authorized the prompt admission to the United States for a period of three months of the alien fiancées or fiancés of citizens of the United States, who had served honorably or were so serving in the armed forces of the United States, during World War II. The benefits of the Act are conferred only when the alien is not subject to exclusion under the immigration laws, the applicable non-preference portion of the quota is exhausted, and the alien intends in good faith to contract a valid marriage to such American citizen. Application for such admission must be made before July 2, 1947.

The Act of July 2, 1946, provided that Filipino persons or persons of Filipino descent and persons of races indigenous to India shall have the right to become naturalized citizens; exempted certain Filipino persons or persons of Filipino descent from the naturalization requirements relating to declaration of intention and certificate of arrival; and defined the classes of persons to be chargeable to the immigration quotas of India and China.

The Act of July 31, 1946, added subdivision (i) to Section 201 of the Nationality Act of 1940. The new subdivision conferred citizenship upon a child born abroad to an alien parent and a citizen parent, who had served or was serving honorably in the armed forces of the United States during World War II, if the citizen parent had previously resided in the United States for ten years, at least five of which were after attaining the age of twelve years.

The Act of August 7, 1946, (amending the Act of February 27, 1925) increased the powers of officers of the Immigration and Naturalization Service to arrest certain aliens without a warrant and to search vessels, railway cars, and other conveyances.

The Act of August 7, 1946, (amending Section 323 of the Nationality Act of 1940) provided for the expeditious naturalization prior to August 7, 1947, of former citizens who had lost their citizenship by voting in a political election in a foreign state other than a state at war with the United States during the Second World War.

The Act of August 7, 1946, (amending Section 2 of the Act of December 17, 1943) granted non-quota immigration status to Chinese wives of American citizens.

**Alien Enemies.** Alien enemies include natives, citizens, denizens, and subjects of countries with which the United States was at war—Japan, Germany, Italy, Hungary, Rumania and Bulgaria. By authority of Presidential Proclamations of December 7 and 8, 1941, and January 14, 1942, a series of regulations was promulgated by the Department of Justice effecting the conduct of alien enemies of the Japanese, German and Italian nationality, fourteen years of age and over. (On October 19, 1942, aliens of Italian nationality were accepted from the travel regulations proscribed by the Attorney General for alien enemies generally.) The President, by proclamation dated December 12, 1945, revoked the regulation of December 7 and 8, 1941, relating to the possession of certain prohibited ar-

ticles and to travel within the boundaries of the United States.

During the fiscal year 1946 the population of the civilian alien enemy internment camps increased by 4,939 including 61 persons born in the camps. The increase consisted mainly of persons from evacuation centers, previously operated by the War Relocation Authority of the Department of Interior. During the same period 10,764 persons departed from the camps—6,224 for repatriation, 280 on parole, 35 for internment at large and 4,201 pursuant to unconditional release; and there were 24 deaths. There remained 1,539 in custody at the close of the fiscal year—982 Japanese, 555 Germans, 1 Italian and 1 Hungarian. Of these, 146 (90 Japanese and 56 Germans) had voluntarily joined the interned head of the family; 891 had been apprehended in continental United States under Presidential warrants; 492 had been brought from other American Republics for internment as alien enemies deemed dangerous to the western hemisphere; and 10 who had been brought, one from Hawaii, eight from the European or South Pacific Theatres of War, and one from an enemy merchant vessel, taken into custody early in the war. Only two civilian internment facilities remained in operation at the close of the fiscal year.

Most of the Japanese who remained in internment had renounced their American citizenship and were being held for repatriation pending the action of the Federal Courts on questions concerning the legality of their forced removal from the United States under the Alien Enemy Act of 1798. Most of the Germans remaining in internment had appealed the action of the Attorney General in ordering their removals and their cases were awaiting action by the United States Supreme Court, which subsequently denied their application for a writ of certiorari on December 7, 1946.

UGO CARUSI.

**INDIA.** A peninsular sub-continent of Asia jutting into the Indian Ocean and separated from the rest of the continent by the Himalayas The Indian Empire, a part of the British Commonwealth and Empire, consists of British India, or the territories subject to British law, and the Indian States, ruled by native princes but under the indirect control of the British Parliament. The total area is 1,581,410 square miles (British Provinces: 865,446 square miles; Indian States and Agencies: 715,964 square miles). Capital, New Delhi. Summer seat of government (April to October), Simla.

**Population.** Total population (census of 1941): 388,997,955. The majority (87 percent) of the people live in rural areas. City dwellers are largely concentrated in such key places as Calcutta, Bombay, Madras, and Hyderabad. The density (about 245 per square mile) is one-third that of England and Wales (724) or Belgium (723) and less than that of Switzerland (265 per square mile).

Birth and death rates remain high, although the latter improved between the 1931 and the 1941 census. In that interval the birth rate rose from 31.3 per thousand to 34 (1939 figure) and the death rate declined from 24.9 to 22.0. The latest infant mortality rate available is high: 162 per thousand.

Although the Indian population includes more than 45 groups speaking nearly 200 different languages, classification is commonly made according to religious communities, as follows (1941): 66 percent Hindus, 24 percent Moslems, 1.6 percent Christians, 1.5 percent Sikhs, followed by Buddhists, Parsees, and others.

In 1941 the percentage of illiteracy in India was 87.8, as against 93.1 ten years before. A program of educational expansion is contemplated. There are 15 universities and numerous specialized schools, but elementary training is still imperfectly developed.

**Government.** The King of Great Britain and Northern Ireland bears also the title of Emperor of India. The Constitution, known as the Government of India Act, 1935, provided for an Indian federation and provincial autonomy. Provincial autonomy went into effect April 1, 1937, when elective legislative assemblies with responsible ministries were established in the 11 Governors' Provinces under direct British rule. The federation scheme was not put into force pending the framing of a new constitution.

In the meantime executive powers were concentrated in the hands of the Governor-General, or Viceroy, who is appointed by the Crown. The Governor-General also holds the separate office of Crown Representative (established April 1, 1937) through which he performs the functions of the Crown in relation to the native states. Pending the framing of a new constitution the Governor-General remains under the direction of the Secretary of State for India in the British Cabinet.

The Governor-General has been assisted by an appointive Executive Council composed of 15 high officials and by the Central Legislature of British India, established in 1921. The Legislature consisted of a Council of State of 32 elected and 26 nominated members and a Legislative Assembly of 102 elected and 39 nominated members. For the caretaker government and the interim government of 1946, see below.

Governor-General and Crown Representative, Field Marshal Viscount (Archibald P.) Wavell, was appointed 1943.

**Events, 1946.** The year was a critical one in Indian history, with a new form of government taking shape, to the accompaniment of apparently insoluble party conflicts and widespread communal violence with serious loss of life. The year opened with the long-established Central Legislative Assembly meeting for apparently (but not actually) the last time and ended with a coalition government installed and a Constituent (constitution-making) Assembly meeting without Moslem participation.

The unreformed Legislative Assembly began its sessions on January 21 and was addressed on January 28 by the Viceroy, who spoke of the British Government's determination to establish a new executive council made up of political leaders and to bring into existence as soon as possible a constitution-making body or convention. The Congress Party benches were empty but Mohammed Ali Jinnah and the members representing the Moslem League Party were present.

The Viceroy took the opportunity to clarify the position of the Parliamentary delegation to India which, he said, had been the subject of some "mischievous speculation." This delegation, consisting of two peers and 8 members of the British House of Commons, with labor member Robert Richards as leader, left England on January 2 for a 5-weeks' visit in India. This was a good-will tour, only semi-official, and the participants were told by Prime Minister Attlee in parting that they had complete freedom of action and were not required to make a report. The delegates traveled widely and left for home on February 10. It was the first time in many years that a parliamentary group had toured India.

**The Cabinet Mission.** On February 19 the British Government made known its decision to send to India a mission of quite another sort: a group of 3 cabinet ministers who would act with the Viceroy, Lord Wavell, in his coming discussions with the leaders of Indian opinion on the constitutional future of the country. The ministers were given power to negotiate with Indian leaders.

In making the announcement Prime Minister Attlee reminded the British House of Commons of the steps planned for the realization of self-government in India as outlined by the Viceroy on September 19, 1945. These included: (1) preparatory discussions with the elected representatives of British India and with the Indian states, in order to secure the widest measure of agreement on the method of framing a constitution; (2) the setting up of a constitution-making-body; and (3) the bringing into being of an executive council having the support of the main Indian parties. The provincial elections, still in progress in India, were expected to guide the mission in determining Hindu and Moslem strength in planning for the future.

The Prime Minister emphasized the point that although the purpose of the mission was to help India, it was for Indians themselves to decide their future form of government. If the decision should be for independence outside the British Commonwealth, it was the duty of the British Government to make the transition as smooth and easy as possible.

The distinguished delegation was headed by the Secretary of State for India, Lord Pethick-Lawrence. The other members were Sir Stafford Cripps, President of the Board of Trade and in 1942 leader of the unsuccessful Cripps mission to India (see YEAR BOOK for 1942, pp. 320-321) and A. V. Alexander, First Lord of the Admiralty.

**Activities in India.** The group, which included 10 other persons, reached New Delhi on March 24 and established offices in the Viceroy's residence. They arrived at a time when severe Hindu-Moslem rioting was going on and at a date when a Moslem League meeting in New Delhi proclaimed a new slogan: "Pakistan [independent Moslem state] or death."

The sentiments of the various parts of the Indian community were investigated extensively and at length. The mission had long interviews, sometimes repeated, with the governors of the provinces of British India: Mohandas K. Gandhi; Maulana Abul Kalam Azad, Moslem president of the Congress Party; Indian princes; Sir Tej Bahadur Sapru, author of an independent plan for the government of India; Mohammed Ali Jinnah, leader of the Moslem League; provincial premiers; Pandit Jawaharlal Nehru; Indian Christian leaders, both Protestant and Roman Catholic; representatives of the Anglo-Indians; numerous other Indian leaders and large numbers of press representatives.

On April 11 the mission announced that it would take a short recess and give an opportunity for decisive consultations between the Indian parties. On April 28 the delegation invited the Congress Party to a round-table conference in an attempt to settle their differences and open the way to India's independence.

The invitation was accepted by both parties, but the atmosphere in New Delhi was pessimistic. The Moslem League, which represented approximately 90,000,000 Moslems as against 250,000,000 Hindus centered in the Congress Party, had won 445 out of 512 Moslem seats in all the provincial legislatures of British India and, according to Moslem estimates, received at least 70 percent of all votes

cast in Moslem constituencies. The Congress Party, disinclined to make concessions to the demand for the independent state of Pakistan demanded by the Moslems, had begun to insist on the immediate formation of an interim government as an alternative to continuing the search for a negotiated agreement.

The round table met in Simla from May 5 to 12, when it closed in failure. The 7-week search of the Cabinet mission for a formula on which the Congress Party and the Moslem League could agree had failed, and the mission itself was left with the responsibility for making proposals.

**The White Paper.** The Cabinet mission's recommendations took the form of a statement on May 16 by the mission and the Viceroy, issued simultaneously in New Delhi to the Indian people and in London as a government White Paper. Saying that they had done their utmost to bring the two main political parties to an agreement and had failed, they recommended that the constitution should take the following basic form:

(1) There should be a Union of India, embracing both British India and the states, which should deal with the following subjects: foreign affairs, defense and communications, and should have the powers necessary to raise the finances for the above subjects.

(2) The Union should have an executive and a legislature constituted from British Indian and states representatives. Any question raising a major communal issue in the legislature should require for its decision a majority of the representatives present and voting of each of the two major communities as well as a majority of all members present and voting.

(3) All subjects other than the Union subjects and all residuary powers should vest in the provinces.

(4) The states will retain all subjects and powers other than those ceded to the Union.

(5) Provinces should be free to form groups with executives and legislatures, and each group could determine the provincial subjects to be taken in common.

(6) The constitutions of the Union and of the groups should contain a provision whereby any province could by a majority vote of its legislative assembly call for a reconsideration of the terms of the constitution after an initial period of 10 years and at 10-yearly periods thereafter.

Thus the Cabinet mission rejected the Moslem demand for an independent state of Pakistan and at the same time proposed by recommending provincial groupings to protect the Moslems from perpetual political subordination to the Hindu majority. The mission recommended the immediate setting up of an interim government to administer India until a constitution could be devised, and urged the provincial legislatures to proceed at once to elect representatives so that constitution-making could proceed.

**Warning and Good Wishes.** The concluding section of the White Paper said that the mission saw small hope of peaceful settlement by Indian parties alone. It spoke of the grave danger of violence, chaos, and even civil war, with the consequent "terrible disaster for many millions of men, women and children." It urged instead the acceptance of the proposals.

Finally, the mission expressed the hope that the new self-governing India would choose to be a member of the British Commonwealth. Whatever the choice, the members looked forward to India's "ever-increasing prosperity among the greatest nations of the world."

**Indian Parties' Indecision.** Even after this major effort on the part of the British Government to push India into constitutional self-government, each of the major Indian parties, Hindu and Moslem, was so undecided about its policy and so quick to reverse a decision if it happened to coincide with that of the opposing party, that the record of the rest of the year would have been comedy if it had

not been concerned with millions of people and with communities torn by rioting and bloodshed.

On June 6 the Moslem League accepted the mission's long-term plan and the plan for an interim government, but reversed the decision on July 29. On June 14 the Congress Party rejected both aspects of the plan. On June 25 the Congress Party altered its opinion on the long-term plan but reiterated its objection to the interim government. On the same date the Moslem League, which had not yet changed its mind about its June 6 decision, sent a letter to the Viceroy approving both aspects of the plan. On July 7 the Congress Party again approved the long-term plan, and the Moslem rejection was not long in following.

In the meantime Viceroy Wavell on June 16 invited 5 Moslems, 5 Hindus, an Untouchable, a Parsi, an Indian Christian, and a Sikh, all important representatives of their groups, to form a new executive council or cabinet. The move was described as an expedient to solve the existing difficulty only. The Congress Party, the Sikhs, and the Anglo-Indians refused to cooperate, but the Moslem League assented to the proposal.

The Viceroy then set up a caretaker government of 9 members, including 2 field marshals and 7 civil servants, 5 British and 2 Indian, the composition of which was announced on June 29. Portfolios were telescoped so that the temporary nature of the regime might be emphasized while the Viceroy continued to strive for a coalition interim government.

**New Executive Council.** Once more the *impasse* was broken on the initiative of the Viceroy, who on August 12 invited Pandit Jawaharlal Nehru, successor to Maulana Abul Kalam Azad, as leader of the Congress Party to make proposals for the immediate formation of an interim government. On August 24 the King accepted the resignations of the Governor General's executive council and approved the appointment of a government, proposed by the Congress Party, of 12 members, 3 of them Moslems. It was expected that 2 more Moslems, bringing the cabinet to 14, would be appointed later.

The vice-president or chief minister of the group appointed was Nehru, and the Congress Party was further represented by four outstanding members. There was one representative each of the Sikhs, Scheduled Castes (Untouchables), Indian Christians, and Parsis. The 3 Moslems were not representative of Moslem opinion in the country, and one of them was in the Congress camp. Five hours after the announcement of the new cabinet, Lord Wavell broadcast over the All-India radio an appeal to the Moslem League to reconsider its negative policy.

The oath of office was administered to 7 members of the new government on September 2 and on September 4 the members held their first meeting. On October 13 it became known in India that the Moslem League had decided to join the interim government with its full quota of 5 members. On October 25 the Moslems took their places and were assigned their portfolios. The cabinet took its appointed part in the opening of the autumn session of the Central Legislative Assembly on October 28, although Hindu-Moslem rioting was going on outside and tear-gas fumes drifted into the Council House.

**The London Talks.** As the time drew near for the meeting of the Constituent Assembly (constitution-making body) on December 9, the abstention of the Moslem League was regarded as ominous. The results of the elections had given Congress

201 seats, Moslems 73, scheduled castes 25, and Indian Christians 7. The Indian states had 93 places.

Civil strife persisted in many places in India. Both Hindus and Moslems were alarmed and Nehru on November 21 ascribed the strife to an intrigue between the Moslems and the British. Jinnah saw in the calling of the Constituent Assembly a plot directed against the Moslems by the British Viceroy, who in Jinnah's opinion had become a tool of the Congress Party.

In an attempt to break the increasing tension the British Government on November 26 summoned Wavell to London and invited also representatives of Hindus, Moslems, and Sikhs. Immediately the Moslem League accepted and Congress and the Sikhs refused. Then the latter two accepted and Jinnah threatened to pull out. Finally Prime Minister Attlee persuaded them all to come at once, and Wavell, Nehru, Jinnah, and Sardar Baldev Singh, leader of the Sikh party, had talks in London from December 3 to 6, with the participation of Prime Minister Attlee and some of his ministers.

The talks ended in failure. The British Government's statement of December 6 indicated that His Majesty's Government would not force on India a constitution drawn up without the participation of the Moslems.

**The Constituent Assembly.** The Moslems' seats were empty when the Constituent Assembly opened its sessions on December 9. On December 13 Nehru moved a resolution to declare India an independent sovereign republic, but soon thereafter spokesmen for moderation, including Dr. B. R. Ambedkar, leader of the Untouchables, pleaded for the postponement of such resolutions until the Moslems agreed to participate.

On December 23 the Constituent Assembly recessed until January 20, 1947. The vote on the sovereignty resolution proposed by Nehru was delayed and in the interval Nehru consulted Gandhi in East Bengal.

**Communal Disorders.** Civil disturbances in India were frequent throughout the year. Rioting took place in Bombay in January and continued for many weeks. It appeared to arise from various causes, including partizanship for the officers of the Japanese-created "Indian National Army" who were under trial, mutiny by the Indian Navy, Hindu-Moslem election clashes, and general mob looting. Madras had strikes and riots in late February and there were heavy casualties in Calcutta in the same month. The Delhi town hall was burned in March.

In June Bombay rioting took the form of clashes between Untouchables and caste Hindus. In other sections general rioting broke out after Nehru was arrested on June 20 for entering the state of Kashmir against the decree of a district magistrate, although Nehru was promptly released.

Ninety persons were reported killed on August 16 in Calcutta, in an outbreak of violence between Hindus and Moslems during the Moslem League's "Direct Action Day" demonstrating against the British plan for Indian independence and the Congress Party's interpretation of it. By August 19 Calcutta's dead were reported as 2,000, and by August 21 as 4,000. A Moslem member of the new interim government, Sir Shafaat Ahmed Khan, was stabbed in Simla after his appointment. At the same time Delhi, Allahabad, and Amritsar saw strife between the religious communities.

Riots flared again in Bombay in the first days of September, with Hindus and Moslems fighting one

another. In the meantime the Government of Bengal, in which Calcutta lies, appointed a judicial commission with wide power to investigate the riots of August 16-20. Disorder on an alarming scale continued in the province through October.

Pandit Nehru was repeatedly fired upon as he made a trip near the northwest frontier in October and finally, on October 21, was slightly injured. Rioters threw stones at a railway car carrying Gandhi at a station near Delhi, but he was not injured.

At the beginning of November two Hindu and two Moslem leaders of the Indian interim government visited Calcutta to investigate the communal disorders which had continued to sweep Bengal since August 16. By this time Bihar, the United Provinces, and Assam were affected. Gandhi, who had been touring Bengal, threatened to fast until death unless peace was restored in Bihar. The Viceroy visited Bihar early in November, when it was estimated that probably 1,000 had already been killed there in religious disturbances.

**The Food Problem.** It was apparent at the end of January that as a result of crop shortages and inadequate imports large portions of India were in danger of famine. The Legislative Assembly, meeting at New Delhi at the time, was told by Indian food officials that 2,000,000 tons from abroad would be needed. The Viceroy traveled hundreds of miles through the stricken areas early in February, and the government invited the Congress Party and the Moslem League to put India's case before the Combined Food Board in Washington. The Moslem League accepted but the Congress Party declined for political reasons.

An Indian delegation headed by Sir Ramaswami Mudaliar reached London on February 12 and subsequently proceeded to Washington. The Viceroy, broadcasting to the Indian people on February 16, called for a reduction in rations and for as much self-help as possible. By this time the deficit was estimated at 3,000,000 tons or more for the year. Food riots played a part in the general rioting in March.

Again on March 13 the Congress Party turned down the Viceroy's proposal to set up a food committee, because of their preference not to compromise their political program. Although the Indian food mission to the United States was critical of unwillingness of the American officials to grant India's demand, the Government of India reported in September that 1,128,460 tons of food were received from abroad in the first 7 months of 1946, and that ships had been diverted from Norway and Switzerland to carry Indian supplies.

**International Relations.** Representatives of India were active in the sessions of the General Assembly of the United Nations in New York in censoring South Africa because of the latter's handling of the Indian minority question (see SOUTH AFRICA, UNION OF). India itself took the long-threatened step of prohibiting trade with South Africa. Notifications dated July 17, 1946, prohibited imports from South Africa and exports to any port or place in that country.

India's adherence to the International Monetary Fund and the International Bank for Reconstruction and Development in December, 1945, in order to qualify as an original member, came under attack at the meeting of the Central Legislative Assembly at the beginning of 1946. Sir Archibald Rowlands, the then Finance Member, acknowledged that in seeking that advantage he had broken a pledge to seek prior approval from the Assembly.

The Congress Party recorded its disapproval of

the Government's action, but sentiment altered in the course of the year, as it became plain that Soviet Russia would not soon be a member of the Bretton Woods institutions and that India would therefore be one of the "big five." In the autumn the vote to adhere was carried unanimously in the Legislative Assembly, but only after criticism of the Anglo-American loan terms was heard.

In the course of the war India became Britain's largest creditor within the sterling area, and Indian opinion has been strong against the scaling down of such loans as was encouraged by the terms of the American loan to Britain. It was announced from London on December 23 that in mid-January, 1946, a British Treasury delegation headed by Sir Wilfred Eady and including William Cobbold, deputy governor of the Bank of England, would go to India to undertake the delicate negotiations for the disposition of Britain's \$5,200,000,000 indebtedness to India.

In May the United States and India cancelled their lend-lease and reverse lend-lease obligations without a dollar settlement. The Government of India announced on December 6 the appointment of Asaf Ali, a Congress Party Moslem and Member for Transport in the Executive Council, as India's first ambassador to the United States.

**Agriculture.** Holdings are subdivided beyond the economic limit. Irrigation is extensive. Rice occupies 35 percent of the cultivated area, followed by wheat and millets in northern and dry areas respectively. India is the world's largest producer of cane sugar and the second in tea and cotton. Maize, jute, pulse, vegetable oils, and hemp are also produced in quantity.

**Mining and Industry.** India ranks eighth among world producers of coal and second among manganese producers. Iron and steel, and textiles are the most important industries. The works at Jamshedpur are the largest single steel works in the British Commonwealth. Cotton textiles, the largest users of factory labor, now supply almost all of India's domestic needs. Small-scale and cottage industries still play an important part in the economic life of India. More than 20 percent of the cotton piece goods produced in India are made on hand looms.

**Foreign trade.** Foreign trade increased in the course of the war and an export balance was maintained. United States trade with India showed a marked increase. Indian imports from the United States rose from a prewar average of \$35,000,000 to \$777,000,000 in 1944, and exports to the United States grew at the same time from \$75,000,000 to \$145,000,000.

India emerged from the war a creditor nation. She reduced her prewar sterling debt to a negligible sum and became Great Britain's creditor for more than 5,000,000,000 dollars.

ALZADA COMSTOCK.

**INDIAN AFFAIRS, Bureau of:** The Bureau of Indian Affairs in the Department of the Interior, acts as the administrative agency in carrying out the provisions of treaties and agreements made with the Indian tribes, and statutes enacted by the Congress. It has jurisdiction over approximately 57,000,000 acres of Indian trust lands which are scattered from Point Barrow, Alaska, north of the Arctic Circle, to the Seminole reservation in the Florida Everglades. These lands vary in size from individual units of a few acres to the Navajo reservation in Arizona, New Mexico, and Utah, which is larger than the State of West Virginia. In many of these areas this bureau, often termed the Indian

Service, must provide almost all of the services which non-Indian citizens receive from the Federal, State, and local governments. Administration functions through a central office in Chicago, Illinois, a liaison office in Washington, D.C., and the field service, consisting of five district offices, 64 agencies, 10 non-reservation boarding schools, and five detached sanatoriums. Each agency is headed by a superintendent, with a staff of specialists in education, health, welfare, extension, irrigation, forestry, and construction.

Reorganization of the Service in the field was achieved in 1946 to expedite and improve administration. The five district offices were set up, each district comprising a number of agencies in several states. Headquarters are at Minneapolis, Minnesota; Billings, Montana; Portland, Oregon; Phoenix, Arizona; and Oklahoma City, Oklahoma. Under new Federal legislation, Secretary of the Interior J. A. Krug delegated to William A. Brophy, Commissioner of Indian Affairs, authority to deal with many matters previously requiring Secretarial approval. Commissioner Brophy in turn delegated much of this authority to district directors and agency superintendents in order to simplify the administrative process.

During 1946, also, the budget structure of the Indian Office was simplified and consolidated, with the approval of Congress.

As of January 1, 1946, Indians under the jurisdiction of the Bureau of Indian Affairs numbered approximately 398,000 in the continental United States, with an additional 33,000 natives—Indians, Eskimos, and Aleuts—in Alaska. They belong to some 200 different tribes and speak at least 55 distinct languages; their customs and ways of life are varied. In general they are a rural people, depending upon livestock, agriculture, timber, and wage work as their principal sources of income.

**Indians' War Record.** During the war, more than 25,000 Indian men and women served in the armed forces, and 40,000 took jobs in war industries. Indians won almost every decoration for valor, including two awards of the Medal of Honor. One of the six men who raised the flag on the summit of Mt. Suribachi was a full-blood Pima. The Marine Corps used 400 Navajos as code talkers, to transmit messages in their native tongue with no fear that the enemy might understand it.

At home the older men, women, and children increased their production of food in spite of the lack of help. Indian income increased because of servicemen's allotments, good wages in war work, and a steady market for agricultural products. Aware of the world's need for food, the governors of nine New Mexico pueblos wrote to UNRRA in the spring of 1946, offering to share their scanty store of grain with hungry people overseas. A contribution of \$40 for the purchase of food was sent in by the Eskimo village of Noorvik, Alaska, where hunger is not unknown.

**Navajo Problem.** With the end of the war and the return of Indian veterans and war workers to their homes, family incomes dropped. Problems whose solution necessarily had to be postponed during the war years, now became pressing. Chief among these was the Navajo problem. This tribe of 55,000 Indians occupies about 25,000 square miles of arid and semi-arid grazing land. Their land, under existing practices, will support only 35,000 Indians on a subsistence level of \$350 annual income per family. During the war years the Navajos had a large additional income from war wages and servicemen's family allotments. In 1946 these sources almost dried up, and the specter of hard-

ship once more appeared on the reservation. Studies made during the year indicated that water could be developed for the irrigation of 130,000 acres of Navajo land. Though the estimated cost per acre is high, irrigation promises to supply a reasonable livelihood for about 4,500 Navajo families. In addition to education which will enable the Navajos to compete for off-reservation employment, full development of their natural resources is essential to bring their income to a decent subsistence level.

The Navajos pressed their demand for adequate schools, citing the treaty of 1868, under which the United States promised to supply a teacher for each 30 children. Present facilities accommodate only one-third of the 20,000 Navajo children of school age. Some of the reservation day schools had to be closed during the war for lack of teachers. School bus service to collect the children was curtailed because tires were not available and roads could not be kept in repair. The difficulty of getting the children to school is increased by the Navajos' custom of following the sheep from winter to summer pasture. Navajos do not live in villages, and the school population of any district is variable.

As a first measure of relief, room was made during the fall term at Sherman Indian Institute at Riverside, California; Chilocco School, Chilocco, Oklahoma; and Albuquerque Boarding School, Albuquerque, New Mexico; for several hundred Navajo students. For those who had never been in school and did not speak English, an intensive course was designed to provide primary and high school education in five years at Sherman Institute.

**Indian Veterans.** Indian veterans began in 1946 to provide effective leadership in many places. On the Cherokee reservation, North Carolina, members of their American Legion Post campaigned for and won the right to vote in the November elections, a right denied Indians of that reservation for a score of years. In New Mexico, suit was brought against registration officials who denied Indians the right to register. All Indians born in the United States, or naturalized, are citizens. New Mexico and Arizona still refuse them the ballot.

Indian veterans were urged by the Indian Service, in cooperation with the Veterans Administration, to take advantage of the benefits available to them under the G. I. Bill of Rights and Public Law 16. Many decided to continue their education, some in non-Indian schools and colleges, others in Indian boarding schools which offered commercial and agricultural courses as well as academic work. A number applied for on-the-job training. On the Cherokee reservation 60 veterans began developing small farms under the guidance of agricultural experts. Each veteran, with his instructor's aid, worked out a three-to-five-year plan for his land, using modern conservation methods. Training included on-the-ground instruction each week, as well as book study. On the Menominee Reservation, Wisconsin, 50 veterans started on-the-job training in the tribal sawmill.

The law makes no distinction between Indian and non-Indian veterans, but Indians owning trust property found some difficulty in obtaining loans through commercial channels because trust land may not be assigned as security. In order to assist these veterans, the Indian Service made it possible for lenders to enter on Indian lands in case of default, and to repossess cattle or other movable property. Indian borrowers were urged to apply to the regular lending organizations, but if these refused, many of the tribes arranged loans to veterans from tribal funds. A number of veterans went

into livestock raising. In the Southwest some started small stores for the sale of silverwork and other Indian crafts.

**The Land.** After the passage of the Allotment Act in 1887, which divided reservation lands into individual holdings for each member of the tribe and then declared the remaining areas surplus, the process of inheritance reduced many of these holdings to unmanageable fractions. The Indian Reorganization Act (1934) made it possible for individuals to exchange small, scattered parcels of land for usable acreage, or to deed land to the tribe in exchange for shares in a tribal enterprise, or for a life assignment in other land. Consolidation of individual and tribal property continued in 1946, and methods of proper land use were worked out for many areas.

As a measure for improving the range and combating erosion, thousands of acres in the Southwest were reseeded by airplane. Seeds of various grasses were enclosed in clay pellets which also contained a small amount of fertilizer and chemicals to repel insects and rodents. The pellets were scattered over the ground evenly by a mechanical device in the plane. Results are being watched.

**Health Service.** The health service still suffered from a severe shortage of doctors, nurses, and other personnel, although some of those who had gone into the armed forces returned to their jobs during the year. Indian cooperation in health measures increased. In many communities tribal health councils were set up by the Indians in order to promote understanding of health practices and to increase their acceptance. A tribal judge on the Pine Ridge reservation, South Dakota, sent a tuberculous Sioux convicted of burglary to a sanatorium rather than to the jail, emphasizing the community responsibility for health protection.

In Alaska, where the incidence of tuberculosis among the natives is very high, plans were approved for the construction of additional hospital and sanatorium facilities. During the summer, the naval base at Sitka was turned over to the Department of the Interior by the Navy for the benefit of the natives. These installations on Japonski Island will be developed into a 200-bed tuberculosis sanatorium and a boarding school for 600 Indian, Aleut, and Eskimo children.

**Moving Homes.** Natives evacuated from the Aleutian Islands to the mainland when the Japanese invaded Attu returned and rebuilt their ruined villages, with the help of the Indian Service. The natives of Attu, reduced by three years' imprisonment in Japan to half their original number, decided to establish themselves on the island of Atka, where many had friends and relatives.

The tribes of the Fort Berthold reservation, North Dakota—Cros Ventres, Arikaras, and Mandans—were faced with the necessity of moving their homes when the War Department's Garrison dam project for flood control on the Missouri River was approved by Congress. The lake created by the dam will flood the heart of the Indian lands. Recognizing the plight of the Indians, Congress directed that lands "comparable in quality and sufficient in area" must be offered to the Fort Berthold Indians as compensation for the lands to be flooded, before construction of the dam could begin. The War Department offered them approximately 160,000 acres of substitute lands, an offer protested by both the non-Indian landowners and the Indians.

**Indian Claims Commission.** In August, 1946, legislation was approved creating the Indian Claims Commission, whose task it is to hear and decide

claims against the United States brought by Indian tribes, groups, or bands. A law passed in 1883 barred Indians from suing in the Court of Claims without a special act of Congress. Because the process of obtaining such an act was long and complicated, many claims never reached the Court. Now all claims originating before August 13, 1946, are to be considered by the three-man commission if presented within five years, and decisions must be handed down within ten years of the date when the commission was established. Claims arising after August 13, 1946, may be presented to the Court of Claims.

The Federal courts upheld the claim of the Quileute Indians, Washington, that the streambed of the Quileute River formed a part of their reservation, and that they were entitled to their traditional fishing rights in it and in nearby tidelands.

On November 25 the Supreme Court upheld a decision of the Court of Claims in favor of the Alsea band of Tillamook Indians, Oregon, ruling that the Indians should be compensated for lands surrendered to the United States in 1855 under a treaty which the Senate failed to ratify. Chief Justice Vinson, writing the majority opinion, stated that: "Taking original Indian title without compensation and without consent does not satisfy the 'high standards for fair dealing' required of the United States in controlling Indian affairs."

**INDO-CHINA.** The southeastern peninsula of Asia, consisting of Burma, Federated Malay States, French Indo-China, Siam, Straits Settlements, the Unfederated Malay States, and the Viet Nam Republic.

**INLAND WATERWAYS CORPORATION.** A Division of the U.S. Department of Commerce (formerly of the War Department) incorporated to carry out sections of the Transportation Act of 1920, to make possible the coordination of rail and water transportation in the United States. It is organized along the lines of a trunk-line railroad and functions entirely on funds derived from operations. It operates barge lines on several important water routes. Chairman of the Board: South Trimble, Jr.

**INSECT PESTS AND PLANT QUARANTINES.** Extensive experimentation has been carried on to determine the usefulness of new insecticidal materials that show promise for the control of agricultural pests, as well as those affecting the health of man and animals, those injurious to stored products, and in the home. Advancements have been made in methods and equipment for applying insecticides and fumigants. Many of the developments resulting from research have been applied to large-scale insect control projects carried on in cooperation with State and other agencies. Some have also aided in simplifying and improving methods, used in certifying materials and products that require treatment, in order to move under plant quarantine regulations. The constant increase of air transportation continues to create problems in protecting the country from importations of new insect pests and plant diseases and in preventing the spread of those already established in limited areas.

**Foreign Plant Quarantines.** The discontinuance of wartime restrictions on shipping and the resumption of world commerce materially affected foreign plant quarantine enforcement at maritime ports. Improved procedures for obtaining advance information on expected arrivals have been adopted, thus making possible a more effective utilization of personnel. Inspection of 47,299 ships during the

fiscal year ended June 30, 1946 represents an increase of 33 percent over the previous 12-month period. Inspection of 58,631 airplanes at 45 ports of entry represents an increase of 28 percent. Prohibited plant material was taken from 12,156 airplanes, representing an increase of 66 percent over the previous fiscal year, while the number of arrivals increased only 28 percent. A total of 3,368 interceptions of insects and plant diseases was made from airplanes. Many of these pests, including mosquitoes, were stowaways that might menace public health, and plant pests of economic importance were found in plant material. This emphasizes the growing importance of the airplane as a rapid disseminator of pests between countries and even continents. More than 9,000 freight cars were fumigated as a condition of entry from Mexico. A total of 5,789,244 other vehicles and 1,282,566 pieces of baggage was examined upon arrival from Mexico, in cooperation with United States Customs, representing increases of 22 and 38 percent, respectively over inspections made during the previous fiscal year. Greatly expanded air traffic and a revival in shipment of fruits and vegetables from Puerto Rico to the mainland also had a marked effect on plant quarantine activities.

**Further Developments of New Insecticides and Methods of Application.** Extensive experimentation has been continued to determine practical and safe uses of various formulations containing DDT. Except against household insects and direct pests of man and animals, such as flies and mosquitoes, few definite recommendations for its use have yet been made. Further tests with benzene hexachloride disclose that it has shown special promise for use against cotton insects and encouraging results against some other insects.

Marked progress has been made in the development of mist blowers for applying concentrated sprays from the ground. Many practical tests of the dispersion of sprays from aircraft have also been undertaken, involving the use of various types of equipment, spray formulas, and dosages against insect pests of cotton, forests, and field crops.

Cooperative work on the use of aerosols in the control of insects on vegetable crops was continued. DDT was used with various solvents and propellents. Mixtures that do not injure plants were developed for field and greenhouse use, and apparatus for applying such aerosols were tested against thrips, aphids, and leafhoppers.

**Insect Repellents.** Screening tests of more than 7,500 chemicals as mosquito repellents for skin applications were completed during the year, and eight chemicals have been found to give over five hours' protection against the bites of yellow-fever mosquitoes. These materials are now being tested for their toxicity to man before they are recommended for use.

**Screwworms and Other Livestock Pests.** The screwworm survey, which has served well to determine the needs of critical ingredients for Smear 62 and to acquaint the livestock industry with the superiority of this remedy for the control of screwworms, was continued. With the cooperation of State personnel, Smear 62 has been introduced in all the affected States, and livestock owners have saved many valuable animals, and prevented many local outbreaks and further spread of the screwworm. Research has been continued to develop formulas containing substitutes for diphenylamine and turkey red oil.

Water suspensions containing DDT were found to be more desirable than solutions and emulsions in spraying dairy barns for the control of houseflies.

The suspensions, when applied to animals, have also been found effective against horn flies. DDT and benzene hexachloride have shown more promise than any materials heretofore used for the control of all species of cattle lice. Both materials appear to be capable of eradicating cattle lice with one treatment, which has not been possible with the older remedies.

**Codling Moth.** DDT has continued to give outstanding control of the codling moth wherever tested. A 50-percent wettable powder containing DDT appears to be the most practical spray formulation for this purpose. Because of the mite problem resulting from the use of this insecticide in apple orchards, and uncertainties about the status of residues, DDT has not been given unqualified recommendation for codling moth control despite its effectiveness.

**Japanese Beetle.** The program for distributing the milky disease of Japanese beetle grubs was continued in cooperation with State agencies in nine States and the Army Service Forces in the First, Second, and Third Service Commands. Authority was granted on March 21, 1946 for the use of DDT for treating soil in nursery plots and potting soil as a means of obtaining certification for movement under Japanese beetle quarantine regulations of plants grown in such soil. Ethylene dibromide has been found generally to be much more effective than ethylene dichloride in various formulations as dips for eggs, larvae, and pupae of the Japanese beetle in soil masses and plant balls, and for surface applications to soil plots containing larvae and pupae. However, more information on plant tolerance is needed before this material can be generally recommended for quarantine treatments.

**European Corn Borer.** This insect spread into relatively little new territory in 1945. However, populations were higher than during 1944 over the greater portion of the Corn Belt and losses due to the borer totaled about \$37,000,000 in 1945. This insect has been controlled experimentally with from two to four applications of DDT sprays or dusts, distributed with either ground or airplane equipment.

**Grosshoppers.** Weather during the early spring of 1946 was favorable to early hatching and rapid development. In May, however, unfavorable weather retarded hatching and development over the Northern Great Plains, but infestations increased rapidly in June. Cooperative control operations were conducted in twenty-three Central, Midwestern, and Western States, affording protection to 5,580,000 acres of crops worth more than \$29,550,000.

**Stored-Grain Insects.** In tests of new grain fumigants, ethylene dibromide in various combinations with carbon tetrachloride, ethylene dichloride, and carbon disulfide gave good protection from insect infestation to wheat stored in steel bins and wooden farm granaries. A mixture of acrylonitrile and carbon tetrachloride gave excellent results in wheat stored in wooden farm granaries, and mixtures of several nitriles in carbon tetrachloride gave excellent control of insects in wheat stored in steel bins. DDT applied as a solution, an oil emulsion, or a water suspension was found to be the most effective material for treating interior walls of wooden farm granaries to reduce insect infestations.

**White-Fringed Beetle.** By the end of 1945 this insect was known to occur on a total of 153,000 acres in Alabama, Florida, Louisiana, Mississippi, and North Carolina. During 1946, white-fringed beetle infestations were found in forty-one Georgia counties, mainly across the central part of the

State and at a small heel yard at Columbia, South Carolina. Quarantine and control measures designed to prevent further spread from infested States included supervision of more than 260,000 shipments of nursery, farm, mill, and timber products, also soil, implements, and numerous other materials. Equipment has been devised to increase the efficiency and reduce costs of insecticide applications at critical points to keep down beetle populations and so also reduce the spread hazard. Treatment of soil with DDT has shown promise of becoming a practical means of controlling this insect. In preliminary tests, benzene hexachloride has been very effective against eggs, larvae, and adults of this pest.

**Vegetable Insects.** In cooperative experiments with the Maine Agricultural Experiment Station, the addition of DDT to fungicide dusts and sprays applied to potato plots appeared to have no visible adverse effect upon the plants, controlled infestations of the Colorado potato beetle and potato flea beetles, substantially reduced infestations of aphids, and appreciably increased yields of potatoes. In large-scale field tests, conducted in cooperation with the Agricultural Experiment Station of the University of Maryland, DDT applied as an aerosol gave satisfactory control of the pea aphid and resulted in substantial increases in yield of peas. The DDT aerosol also gave outstanding control of the onion thrips on cucumbers in commercial greenhouses, being more effective than any methods formerly employed. Encouraging preliminary results were obtained in tests with benzene hexachloride against the Mexican bean beetle.

**Cotton Insects.** The boll weevil caused more damage in 1946 than during 1945. Further tests with benzene hexachloride showed that high concentrations killed the boll weevil more quickly than did calcium arsenate, and it also killed more cotton leafworms, plant bugs, cotton flea hoppers, and cotton aphids than the standard insecticides. It is the first insecticide ever found that gives promise of destroying the boll weevil, cotton aphid and other sucking insect pests of cotton at the same time. Initial infestations of pink bollworm were found in 1945 in Brown and Medina Counties, Texas, and reinfestations in Chambers, Harris, and Liberty Counties after more than 20 years' freedom. A program was inaugurated in June 1946 to control this insect by applying DDT to the most heavily infested areas of the lower Rio Grande Valley of Texas and Mexico.

**Gypsy Moth and Other Forest Insects.** Preliminary results of large-scale application of DDT by aircraft, a new type of blower apparatus, and knapsack sprayers indicate complete control of the gypsy moth in areas treated by aircraft and blowers, and from drastic reduction to complete control where knapsack sprayers were used. More than 125 square miles of infested territory in Pennsylvania, eastern New York, and western New England were sprayed as part of the control program. A major revision of the area regulated because of gypsy moth became effective on October 10, 1945, adding 9,100 square miles to the area. Results of large-scale tests conducted in 1945 to determine what effect the widespread use of DDT over forested areas would have on beneficial insects, fish, and wildlife show that where only 1 pound of DDT per acre was applied there was no apparent effect on the bird populations, generally only slight injury to fish and other aquatic life, and only a temporary reduction in the general insect population.

In the spring of 1946 several large test plots

were sprayed with DDT from an airplane for control of the white pine weevil, in cooperation with the New York State Department of Conservation. Preliminary observations indicate that reasonable control was obtained. The spruce budworm infestations covering several hundred thousand acres in Colorado suddenly decreased during 1945. A study of the entomophagous parasites showed a very high population of a number of species, but conclusions regarding the total contribution of parasites to the decline cannot be drawn until other control factors are studied.

**Bee Culture.** An antibiotic associated with spores of *Bacillus larvae*, the causative organism of American foulbrood, has been found effective in laboratory cultures against various organisms, including those causing undulant fever, and human and bovine tuberculosis. The first preparations of this antibiotic, however, were exceedingly toxic to test animals. Methods for lowering this toxicity have been developed but, as yet, not to the point where the antibiotic may be safely administered to animals other than mice. A milk test for American foulbrood, based on the production by *B. larvae* of an enzyme that hydrolyzes milk, has been simplified so that it can be used in the field. Extensive observations have indicated that DDT, when properly applied for insect control, appears not to have lasting effect on honeybee colonies in or near fields treated with this insecticide. Benzene hexachloride proved exceedingly toxic to bees under laboratory conditions.

**Foreign Parasite Introduction.** Importations of parasites of the vegetable weevil, the cotton boll weevil, armyworm, and the sugarcane borer were continued. The importation from Australia of insect enemies of the Klamath weed was continued and feeding tests were made on a series of crop plants. Completed tests showed no feeding or reproduction by the imported leaf-feeders *Chrysolina hyperici* Foerst. and *C. gemellata* Rossi. The first releases of *C. hyperici* were made in northern California early in 1945 and releases of both species, totaling 19,000 adults, were made late in the summer of that year and in the spring of 1946.

**Dutch Elm Disease.** There was some extension of the known limits of infection. Spread into Vermont and Kentucky constituted first records for these States. The finding of this disease in Ohio and West Virginia territory already invaded by phloem necrosis has further complicated enforcement of the quarantine. In small-scale tests bark beetles that transmit the Dutch elm disease fungus and sucking insects that may transmit the virus causing the phloem necrosis disease of elm were controlled by the use of DDT.

**White Pine Blister Rust.** There was some extension of the disease in northern California and in the North Central region during 1945. Nearly 19,000,000 ribes bushes were removed that year from 1,018,862 acres, of which 420,628 acres were initial eradication and 598,254 acres were rework.

P. N. ANNAND.

**INSURANCE.** The year 1946 was a great year for insurance companies, the life companies, particularly, experiencing new "highs." The casualty companies were also rewarded by fine results, mainly because of a trend to increase premiums on those types of insurance which had proven unprofitable because of excessive claims, i.e. burglary and automobile insurance.

Much of the life insurance production has been attributed to the increasing interest on the part of business men the country over in Pension Trust

Plans and Group Annuities. It is easily understood why these plans should be popular when it is realized that the amount expended by companies in such Trusts are deductible from income tax returns, whereas the amount credited to the individual each year need not be added to his or her income tax return as additional compensation. Another reason for increased life production is the offshoot of the so-called "easy money" of which the public seems to have a large share. And finally, the Life Insurance Companies of America, having withstood so well the difficulties of another war, public confidence has reached a new high, so that today life insurance still is found to be the backbone of the average estate.

**National Service Life Insurance.** One of the biggest bits of news for the year was the signing of Bill 6371 by the President, completely overhauling, liberalizing, and modernizing our National Service Life Insurance as of August 1, 1946. The major revisions consisted of adding plans of insurance, which hitherto had not been available, the range of policies now including Term, Ordinary Life, Twenty-Payment Life, Thirty-Payment Life, Twenty-Year Endowment, Endowment at age sixty-five, and Endowment at age sixty. Also, the Bill enables the insurance owner to take advantage of Settlement Options similar to those available in the policies of Commercial Companies, as well as of the clause granting waiver of premium and monthly income in the event of total and permanent disability. But, the principal feature was the discontinuance of the rule preventing a policy-owner from having any but blood relatives as beneficiaries. Now, any person, corporation, or entity may be named as a beneficiary. There are many veterans to whom Government or National Service Life Insurance was unattractive because of the many previous restrictions, who will now be happy to continue their policies.

**Life Insurance.** In a report published towards the end of the year the Institute of Life Insurance stated that the American families are now using 33 percent of the national income for family protection through life insurance. Thus, the current flow of premium payments runs at the annual rate of \$5,500,000,000. Such a large premium total provides life insurance protection in the amount of \$160,000,000,000, supplemented by annuities which represent an annual income of \$866,000,000. Comparing these figures with those for 1945 we have a substantial increase. For example, the 1945 premium total was \$5,249,000,000 as against the above \$5,500,000,000 for 1946.

In October, 1946, at the annual meeting of the Life Insurance Advertisers Association Holgar J. Johnson, President of the Institute of Life Insurance, announced a six-point program enlarging the public relations activities of individual life insurance companies with emphasis on building further competitive environment through advertising. Mr. Johnson stated that competition in advertising and in other activities has proven of benefit, not only to the individual companies themselves, but to the life insurance business as a whole in its determination to meet its social obligations to the public.

Last fall the *American Magazine* made a nationwide survey which revealed some facts concerning life insurance. The survey showed that one out of five of this magazine's readers was planning to buy more life insurance; 14 percent of families with annual incomes of \$5,000 or more, carry less than \$5,000 of life insurance. It would seem from this that there is still much work to be done by the life insurance men and women of America.

Whereas most operating costs have increased materially, there is real pride among life insurance executives because the cost of operations in 1946 seemed to run parallel to those of 1945. And the 1945 figures were 13.7 percent as compared with 13.6 percent for 1944. The average for the last three years was 13.7 percent, while the average for the ten years prior to the war was 14.0 percent. This may not seem like a great margin of difference but applied to the total annual income of the business it represents a saving in aggregate expenses of approximately \$20,000,000 annually.

**Suretyship.** Probably the biggest factor in the increased demand for Fidelity insurance, is the continued publication of stories in the daily press of trusted employees suddenly misusing funds entrusted to them or over which they have control. From the underwriter's standpoint the reason why these things occur is that the so-called trusted employee is not scrutinized and his books are not audited frequently. Thus, he may "borrow" some money with the thought of repaying later on. That is generally the way these cases start. It is only natural therefore that the results for the past year have been eminently satisfactory to the surety companies, who look for even better results in the immediate future.

**Marine Insurance.** Marine underwriters and executives generally seem to be most optimistic about the future and very happy about the results in 1946. The year just closed gave them a healthy increase in the volume of business and with the peacetime trade "getting into the swing of things" premium volume on marine insurance naturally increased. This was particularly true of shipments to South America. "All in all," said one marine executive, "marine insurance is 'moving up.'"

**War Damage Insurance.** On March 16, 1946, the War Damage Corporation ceased to operate after having issued 8,700,000 policies through 546 fire insurance companies and 88 casualty-surety companies. It was estimated by R.F.C. Chairman, C. B. Henderson, that on June 30, 1945, when War Damage Corporation was three years old, approximately \$117,000,000 of insurance was in force. Since V-J day very few policies of "W.D.C." have been applied for. Thus, an impressive record of wartime service is closed.

**Fire Insurance.** In 1946, the fire losses in the United States touched the highest figure since 1906, the year of the San Francisco earthquake. One reason for the large increase, which brought the total losses to over half a billion dollars, was the increase in values over the last few years. A building that sold for \$500,000 ten years ago, sells for about \$1,000,000 today. With millions of similar cases of increase, countrywide, the volume of insurance is naturally much higher today. Of course, the main reason for the continued increase in claims, is that dwellings are burning at the rate of 400,000 a year. Fire losses have increased 30 percent since the end of the war and over 11,000 persons have been burned to death, of which 3,000 were children. In the month of August, 1946, alone, losses in the New York area increased 346 percent and countrywide losses in September alone were increased 24 percent. At a convention of Fire Chiefs held in New York it was said that "America is the world's Number One Fire Trap."

During the spring there were two disastrous hotel fires, the La Salle in Chicago, and the Canfield in Dubuque, Iowa. Little is known as to how La Salle Hotel fire started but before it was under control there was extensive damage and the loss of sixty-one lives in a supposedly "fireproof" structure

insured for \$2,000,000. Whereas the increasing claims have caused alarm among fire underwriters, still, the fact that the public is gradually being educated to increase the policies to meet the increased cost of replacement and increased values, should swell the premium income of the companies thus avoiding, for the time being, any thought of increasing premium rates.

**Air Insurance.** The continued increase in air travel has resulted in widespread interest in and use of air insurance by air travelers. This has been especially true in the number of people purchasing policies on a yearly basis, who heretofore had simply purchased trip policies at airports. In June, 1946, a twin-motored Army C-45 plane crashed into the Bank of Manhattan building, New York, doing considerable damage to the building. It was discovered later that the bank was protected under a \$500,000 aircraft property damage policy, which it was said, had been purchased immediately following the airplane damage done to the Empire State building in July 1945. The Empire State building was not insured. The Manhattan Company's loss was estimated at only \$50,000 and was far less than the extensive damage to the Empire State building.

**Casualty Insurance.** To meet the acute situation brought about by rising accident frequency and increases in average claim costs in automobile accidents the companies made a countrywide jump in rates on liability and property damage insurance, effective August 1, 1946. Announcement was made at the time, that when gasoline rationing was lifted in August 1945, the number of accidents increased sharply and the accident ratio has been increasing constantly since then. Companies see little promise of an early improvement in the situation.

An interesting departure from the almost "standard" method of operation was instituted when Governor Dewey signed the W. J. Mahoney Bill, amending Section 46 of the Insurance Law, to permit both fire and casualty companies to write the Personal Property Floater (known as "the all-in-one" policy). Heretofore the law permitted only fire and marine companies to write this type of coverage.

During the summer, the theft insurance rates were increased materially, as the result of the unusually heavy burglary losses, the companies having paid out in 1945 and the early part of 1946 as much as \$1.50 for every dollar of premium received.

In general, the picture among casualty companies is unsatisfactory. The president of one of the foremost multiple line groups of companies characterized the business as "two-headed"—progressing better insofar as volume of business was concerned, but worse insofar as profit and loss results are effected. There is doubt among many of the executives of the major companies that there was much profit in the overall experiences of casualty companies for the year. This does not mean that these men are pessimistic. But they feel that until such time as strikes, labor disputes, priorities, unstabilized costs, and their accompanying ills have been stilled and the country swings into full production once more they will be lucky to break even. It is in that spirit that they welcome the year ahead.

MERVIN L. LANE.

INTER-AMERICAN AFFAIRS, The Institute of, and INTER-AMERICAN EDUCATIONAL FOUNDATION, INC., continued during the year 1946 cooperative development programs in the other Americas which

originally were initiated by the Office of Inter-American Affairs. The Office of Inter-American Affairs, which developed into a powerful wartime agency for coordinating the productive and economic power of the Western Hemisphere to support the United Nations against the Axis, was terminated by Executive Order of President Truman, effective May 20, 1946. This termination, a natural part of the government's reconversion program, did not affect the work of The Institute of Inter-American Affairs and the Inter-American Educational Foundation, which constituted its chief operating forces in the field.

During 1946, the major activities of the Transportation Division of the former Office of Inter-American Affairs were brought to a close. The Transportation Division continued to function, under the Institute, but upon a planned scale of diminishing activity, so its operations, as a unit, could be wound up by the end of the year. The operations closed out during 1946 included one of the most extensive transportation projects of the Office of Inter-American Affairs—the United States Railway Mission to Mexico. The success of this Mission was outstanding, in assisting to rehabilitate the Mexican national railroads. During many preceding years, and due to many complicated factors, these railroads were unable to bear the strain of wartime traffic needed to supply the United States with strategic war materials. The U.S. mission facilitated inestimably the movement of vital war materials, and with Mexican technicians laid the groundwork for better railroads in the future.

Under the auspices of the Institute, through the Transportation Division, visits to and tours of the United States were arranged for highway and transportation engineers from Brazil, Peru, Colombia, Ecuador, Panama, Costa Rica, and other American Republics. These missions had been found helpful during the war years, and during 1946, highway and bridge engineers, city planning experts, and other construction and operating authorities in the transportation field—usually officials of their respective governments—were aided in their postwar transportation problems by extensive tours in this country. They visited roads and highways of every type, bridges, tunnels, parkways, and many manufacturing plants where road-building and maintenance machines are produced. These inspections included New York, New Orleans, San Francisco and the West Coast, Chicago, Detroit, Pittsburgh, St. Louis, and representative cities and regions throughout the country.

The Office of Inter-American Affairs was created by Executive Order of the late President Franklin D. Roosevelt, August 16, 1940, and was headed by Nelson A. Rockefeller, with the title of Coordinator. Mr. Rockefeller directed the Office, which is now officially designated as the Institute, during all of its wartime operations. The Inter-American Educational Foundation was organized by the Office during 1943, to develop a comprehensive cooperative educational program with the other American Republics. As has been indicated above, The Institute of Inter-American Affairs and the Inter-American Educational Foundation, Inc., now have the status of two separate United States Government Corporations, under the general jurisdiction of the Department of State, with Colonel Arthur R. Harris as their common President.

The major operations of the Institute include projects in Health and Sanitation; Food Supply; a Training Division; Transportation (the program which is virtually completed, as far as the present

body, the Institute, is concerned, although the work it started will be carried on, it is planned, in the various countries concerned, by their own governments, and possibly with some continued assistance from the United States. That is a matter of policy to be determined in the future).

The Institute and its Health and Sanitation Division consistently sought implementation of the recommendations of the Third Meeting of Ministers of Foreign Affairs of the American Republics, held at Rio de Janeiro in January, 1942. Delegates of all twenty-one American Republics agreed at that meeting that:

The defense of the Western Hemisphere required the mobilization of the vital forces, human and material, of the American Republics, and

Adequate health and sanitary measures constitute an essential contribution in safeguarding the defensive powers and the ability to resist aggression of the peoples of the American Republics.

The joint inter-American cooperative health programs set up in response to this resolution had both an immediate and a long-range objective. Their immediate purpose was the health protection of Latin American workers producing vital war materials, and also the health of troops stationed in strategic areas throughout the Americas. The long-term purpose, which is now the major one, is the preparation of a groundwork for continued elevation of health standards in the hemisphere. Better health means, in turn, greater productivity, better levels of living, and an expanding economy in all the Americas.

This—plus educational and transportation advances—is the initial essence of the understandings upon which the "Good Neighbor Policy" was planned. It is the basis of the practical operations of The Institute of Inter-American Affairs and the Inter-American Educational Foundation.

The health programs of the Health and Sanitation Division of the Institute are organized entirely on a cooperative and democratic basis. They are administered by a joint organization known in most Latin American countries as the *Servicio Cooperativo Interamericano de Salud Publica*, or Inter-American Cooperative Public Health Service. This title is usually abbreviated to SCISP, and the agencies are popularly referred to as *servicios*.

Under the terms of the original agreements, the United States and the host government each contributed a share of the money, materials and trained men and women needed to carry on the programs. The direction of activities and the spending of pooled funds is decided upon jointly by the Chief of Party of the Institute, and an appointee of the cooperating national government. The *Servicio* is organized within the framework of the government, usually under the Health Ministry.

During 1946 there were about 10,900 health engineers, nurses, other technical personnel and unskilled workmen engaged in the operations of the *servicios*, with some 130 of the cooperating technicians from the United States.

The governments participating in this joint work, in the order in which they signed original agreements, were: Ecuador, Brazil, Haiti, Paraguay, Costa Rica, Nicaragua, El Salvador, Honduras, Peru, Bolivia, Guatemala, Colombia, Panama, Venezuela, Chile, Mexico, Dominican Republic and Uruguay. The Panama program was completed in 1945, but most of the others extend through 1947, and several through 1948.

As the agreements have been renegotiated, the participating Latin American countries have raised their respective contributions, and their na-

tional budgets for ministries and departments responsible for basic economy. Some of their allotments are larger than that of the United States. In one country the ratio is ten local dollars to one from the North American partner.

Training of South and Central American technicians is playing an integral part in all programs by providing a staff of national technicians to carry on the public health and sanitation activities after the expiration of the Institute program. This is being accomplished both by training of National doctors, nurses, and engineers in graduate schools of the leading Universities in the United States, and by working with North American technicians, both in their own countries and in the United States. This type of training gives the Latin American technicians a broad knowledge of American methods and products.

The objectives, sought and attained by this program, are of mutual benefit to the cooperating country and to the United States, both in terms of improvement in public health in the Western Hemisphere, and also as most important factors in promoting economic progress and facilitating commercial relations between the United States and the other American Republics.

The Institute's Food Supply Division has seen the wartime emergency character of its food supply program change from one of direct concern with the successful prosecution of the war, to operations emphasizing the improvement in chronic economic conditions that had been aggravated by war and that will continue critical, experts believe, during the immediate postwar years. The trend is increasingly toward greater financial participation in the programs by local governments, which must precede their assumption of administrative and technical operation of the programs.

The Food Supply Division's war objective was: to encourage and help organize increased production of food crops for workers engaged in the procurement of strategic materials, and for the armed forces.

Its objective now, as it has been since the end of the fighting, is: to demonstrate ways of improving the level of living and increasing the purchasing power of the people, who are potential suppliers and customers of the United States; thus contributing to the economic stability of neighbor countries, and increasing the purchasing capacity of important customers, who have a still more important potential purchasing capacity as their levels of living are increased.

The Third Inter-American Conference on Agriculture, at Caracas, Venezuela, in July, 1945, recognized the need for continued agricultural assistance by the United States. In its Final Act, the Conference stated that the work of The Institute of Inter-American Affairs and the United States Department of Agriculture has been beneficial "(a) in promoting the production of food; (b) in facilitating technicians and new agricultural techniques; (c) in furthering technical education and development by the interchange of students," . . . and that . . . "This collaboration should be continued so that it may render the maximum possible benefits."

The program of the Inter-American Educational Foundation was developed to implement resolutions adopted at inter-American conferences, especially the Conference of Ministers and Directors of Education of the American Republics, at Panama in 1943, recommending cooperative action to improve and strengthen educational facilities in the Americas. The general objective of the Founda-

tion is the development of cooperative educational programs with the other American republics that emphasize vocational and health education, the training of teachers, the improvement of rural life and agriculture, the development of community schools, and the teaching of the English language.

Educational activities have been carried on in all twenty of the other American republics, including those which did not sign cooperative agreements. Activities in those countries consisted largely of interchanges of personnel and materials. Twenty-one specialists in vocational, health, and rural education, teacher training, and English teaching, were sent to the other American republics in 1944 and 1945. During 1946 these twenty-one specialists were joined by some thirty additional associates and collaborators. During the last three years between 500,000 and 600,000 books, pamphlets, maps, charts and other teaching materials were made available to the Field Parties of the Foundation, and to schools in all twenty of the other American republics. All in all, about sixty distinguished educators, supervisors and teachers have been brought to the United States from the other republics, to lecture, study, and to participate in national, state, and local educational programs.

Thus, it is seen that The Institute of Inter-American Affairs has gone through three functional phases: (1) its beginning, some six months before Pearl Harbor, had two motivations: the emergency aspect of hemisphere defense; and the long-term aspect of economic development of the Western Hemisphere, all based on mutual understanding and cooperation; (2) the combat years of the war, a program of vigorous inter-American cooperation in military affairs, control of subversive activities and Axis propaganda; health and sanitation; transportation; communications; education and general economic development; (3) the present phase, which assumes two broad categories: economic development, with attendant health, sanitation, food supply and education programs; and informational activities.

The fundamental objective: pre-Pearl Harbor; war; and postwar, remains unchanged. The "Rio Charter" (formulated by the emergency conference of the Ministers of Foreign Affairs of the American Republics at Rio de Janeiro, after Pearl Harbor) visualized the well-being of all the peoples of the Western Hemisphere as a fundamental goal. That continues to be the charted course of The Institute of Inter-American Affairs and the Inter-American Educational Foundation.

ARTHUR R. HARRIS.

**INTER-AMERICAN DEFENSE BOARD.** An autonomous, permanent organization under the auspices of the Pan American Union (q.v.) established in accordance with Resolution 39 of the Meeting of Foreign Ministers of Rio de Janeiro in January, 1942. It is composed of military, naval, and aviation technical delegates appointed by each of the governments of the 21 American Republics to study and to recommend to their governments the measures necessary for the defense of the western hemisphere. Chairman: Lt. Gen. M. B. Ridgway; Coordinator: Brig. Gen. F. A. Irving; Secretary General: Col. L. S. Hitchcock.

**INTERIOR, U.S. Department of.** A Department of the U.S. Government, created in 1849 and charged with the responsibility for advancing the domestic interests of the people of the United States. In 1946 it comprised the following principal branches:

Office of the Secretary  
Bureau of Land Management

Bureau of Reclamation  
 Geological Survey  
 Oil and Gas Division  
 Coal Mines Administration  
 Bureau of Mines  
 Office of Indian Affairs  
 National Park Service (see NATIONAL PARKS)  
 Fish and Wildlife Service  
 Office of Fishery Coordination  
 Petroleum Conservation Division  
 Solid Fuels Administration for War  
 War Relocation Authority (terminated June 30, 1946)  
 Division of Power  
 Division of Territories and Island Possessions  
 Puerto Rico Reconstruction Administration  
 Office of Land Utilization  
 Office of the Solicitor  
 Office of the Chief Clerk  
 Division of Information  
 U S Board on Geographical Names  
 Budget and Administrative Management Division  
 Bonneville Power Administration  
 Southwestern Power Administration  
 Division of Personnel Supervision and Management

Secretary of the Interior in 1946: Julius A. Krug;  
 Under Secretary, Oscar L. Chapman.

**INTERNAL REVENUE, Bureau of.** A division of the U.S. Department of the Treasury, created in 1862, which supervises the determination, assessment, and collection of all internal revenue taxes and enforces the internal revenue laws. In addition it is charged with the stabilization of all salaries in excess of \$5,000 as well as salaries under \$5,000 of executive, administrative, and professional employees not represented by a recognized labor organization. Major divisions are the Income Tax Unit, the Alcohol Tax Unit, the Miscellaneous Tax Unit, the Salary Stabilization Unit; the Accounts and Collections Unit, and the Field Service. Commissioner: Joseph D. Nunan, Jr.

**INTERNATIONAL COMMISSIONS.** The following Commissions were related organizations of the U.S. Department of State in 1946.

**International Boundary Commission—United States, Alaska, and Canada,** created under treaties of 1906, 1908, and 1925 to define, mark, and maintain the boundary between the United States and Canada and between Alaska and Canada.

**International Boundary Commission—United States and Mexico,** organized under the treaty of 1889.

**International Fisheries Commission—United States and Canada,** established in 1923, which investigated and now regulates the halibut fishery.

**International Joint Commission—United States and Canada,** created in 1909 with jurisdiction over the boundary waters between the United States and Canada.

**Caribbean Commission—United States, France, the Netherlands, and Great Britain,** organized to encourage and strengthen social and economic co-operation between member countries and their territories and colonies in the Caribbean area.

**INTERNATIONAL INFORMATION AND CULTURAL AFFAIRS, Office of (OIC).** Government agency which was created Jan. 1, 1946, to continue the overseas information activities of the Office of War Information and the Office of Inter-American Affairs. The agency, which functions within the Department of State, succeeded an interim international information service. The purpose of the OIC is described in a published letter from Secretary of State Byrnes to President Truman as that of presenting to the world "a full and fair picture of American life and of the aims and policies of the U.S. Government." American libraries of information are to be maintained abroad. Documentary films describing the U.S. are to be scored into foreign languages and

sent overseas. A Russian-language magazine intended for distribution in the Soviet Union is to be continued, and short-wave broadcasting will proceed on a reduced scale until action has been taken to dispose of transmitters and frequencies now controlled by the Government. The exchange of students, scholars, and technicians with foreign countries will be continued on a larger scale; operating under the supervision of diplomatic missions, particularly in the case of Latin America; and small staffs will be maintained in 62 countries to direct informational and cultural relations. Mr. Byrnes adds that although the program is "modest compared to war-time standards," it is a "new departure for the United States" for which "a significant expansion in terms of personnel and budget" is planned. William R. Benton, Assistant Secretary of State, is in charge of public affairs for the agency, and the director is William Stone. The Chief of the International Press and Publications Division is J. Noel Macy. Chief of the International Broadcasting Division is Kenneth D. Fry.

**INTERNATIONAL LABOR ORGANIZATION (ILO).** An association of nations which seeks by international action to improve working conditions, raise the standard of living, and further economic and social stability. Its machinery consists of the International Labor Conference, the Governing Body of the International Labor Office, and the International Labor Office. The Conference, which meets at least annually, is composed of four delegates from each Member State: two Government representatives and a representative each from management and labor who are chosen by Governments in agreement with the most representative employers' and workers' organizations in their respective countries. The principal function of the Conference is to adopt Conventions and Recommendations which define minimum standards of social policy. Sixty-seven Conventions and 74 Recommendations have been adopted by the Conference.

The Governing Body is composed of thirty-two members, sixteen of whom represent Governments, eight of whom represent labor and eight of whom represent management. Eight of the Government seats are non-elective and are held by the states of chief industrial importance. The other eight are filled by Governments elected by the Government delegates to the Conference in an election in which the eight states of chief industrial importance do not participate. The labor and management representatives are elected by the labor and management groups at the Conference.

The International Labor Office acts as the secretariat to the Conference and Governing Body, publishes a series of periodicals, including the monthly *International Labour Review*, which appears in English, French and Spanish, undertakes research on problems of industrial safety, employment, social security, etc., and publishes the results of these studies and reports in several languages.

The Directorate of the International Labor Office is; Acting Director: Edward J. Phelan (Ireland); Asst. Directors: Lindsay Rogers (United States); Jef Rens (Belgium); George A. Johnston (United Kingdom). ILO Branch offices: Washington, London, Paris, New Delhi, Chungking.

See **LABOR CONDITIONS** under *Labor Movements*.

**INTERNATIONAL TRADE, Office of.** The basic purpose and function of the Office of International Trade, Department of Commerce, is to promote the foreign trade of the United States, both export and

import, with the view to maintaining full production and employment, facilitating the expansion and balanced growth of international trade, and stabilizing international economic relations. In pursuing this objective the Office represents the interests of the foreign trade community, not only in supplying its continuing need for factual information, analysis and advice concerning world commerce, but also in providing it with a channel and voice in the formulation of this country's foreign economic policy, and, in turn, interpreting that policy to business men.

The Office is charged with execution of the Department's statutory responsibilities of collecting, analyzing, and disseminating statistics and other information as to the foreign trade of this and other countries, as to present and potential sources of supply for imports and markets for exports, and as to foreign business concerns, trade opportunities and available channels of distribution.

The Office administers the China Trade Act, under which companies may secure Federal incorporation, provided that they will, in the judgment of the Secretary of Commerce, aid in developing markets in China for goods produced in the United States. Corporations organized and operated in accordance with the Statute and regulations, doing business solely in China, enjoy certain tax exemptions under the internal revenue laws.

The administrative functions of the Secretary of Commerce under the Foreign Trade Zone Act of 1934, as well as those of the Executive Secretary of the Foreign Trade Zones Board, likewise fall within the Office of International Trade.

It is also the function of the Office of International Trade to participate, with the State Department and other interested agencies, in formulating the foreign commercial and economic policy of the United States; representing the Department of Commerce on the President's Executive Committee for Economic Foreign Policy, the interdepartmental Trade Agreements Committee and the Committee for Reciprocity Information, as well as other departmental committees, such as the Board of the Foreign Service. Through the membership of the Secretary of Commerce on the National Advisory Council the Office also participates in the foreign lending and investment policy and program of this country, as carried out by the International Monetary Fund, the World Bank, the Export-Import Bank, and otherwise. The Department's responsibilities in connection with the activities of the United Nations, particularly with respect to the Economic and Social Council, the Food and Agriculture Organization, and the proposed International Trade Organization, are likewise borne by this Office.

The export control powers, which were administered by the former Foreign Economic Administration, are exercised by this Office.

ARTHUR PAUL.

**INTERSTATE COMMERCE COMMISSION (ICC).** An independent establishment of the U.S. Government empowered to regulate, in the public interest, common carriers engaged in transportation in interstate commerce. (For details, see *YEAR BOOK* for 1940.) Part IV of the Interstate Commerce Act, approved May 16, 1942, conferred upon the Commission jurisdiction over freight forwarders. Chairman: George M. Barnard.

**IRAN (Persia).** A kingdom in southwestern Asia. Area, approximately 628,000 square miles. Capital, Teheran (Tehran).

**Characteristics of the People.** Estimates of the country's population vary from less than 10,000,000 to over 15,000,000. From a quarter to a third of the inhabitants are still nomads, living largely under tribal organization. Most Persians are Moslems of the Shia sect, except for some 850,000 Sunnis. There are small communities of Parsees, Jews, Armenians, Nestorians, Bahaists and others. Persia had been the melting pot of invading peoples and races from time immemorial, and this is evident from the existence of various minorities within her borders: e.g. Armenians and other Caucasian peoples in the northwest, Kurds in the west, Turks in the northeast, Arabs in the southwest, etc.

The educational system of the country was drastically reformed during the modernizing era of Riza Pahlevi. In 1937 there were 4,939 schools, a figure which during recent years has undoubtedly grown considerably. A university has been set up at Teheran offering a wide curriculum of technical and liberal studies. In general, foreign schools have been absorbed into the national educational system or have been abandoned.

**Government.** The reigning king, or Shah, is Muhammed Riza Pahlevi, who succeeded his father, Riza Khan Pahlevi in September, 1941, when the latter was forced to abdicate by concerted Anglo-Soviet action because of his unwillingness to take energetic measures against the Axis and its agents in his country. The Constitution provides for a national assembly, or Majlis, to which the Cabinet is responsible. The country is divided into numerous divisions and subdivisions, the administrators of which are responsible to the central government.

The budget estimates for 1944-45 showed a revenue of 10,325,000,000 rials and an expenditure of 10,324,000,000 rials. These figures include both the ordinary and the extraordinary budgets, the latter of which provides for the Government's various industrial and commercial enterprises. In recent years a number of American financial experts under Mr. Arthur C. Millsbaugh served the Persian Government.

An American police mission under Colonel Norman Schwarzkopf of New Jersey has been reorganizing the country's police forces. The army, navy and air forces have also been undergoing reorganization. Beginning in 1941 considerable areas of Iran's national territory were occupied by British, Soviet, and American troops. However, the country's territorial integrity, sovereignty and political independence were guaranteed by a treaty of alliance signed at Teheran by Great Britain, the U.S.S.R. and Iran on Jan. 29, 1942, and by the end of 1946 the country was virtually free of foreign troops. This was confirmed by a Declaration made by Mr. Churchill, President Roosevelt and Marshal Stalin at the time of the Teheran Conference, Dec. 1, 1943.

**Events, 1946.** The year opened with a search for some sort of formula by which Iran could be freed of foreign occupation. All American forces were withdrawn by January 1, and only a few thousand British troops remained. The real problem concerned the extensive Soviet forces in northern Persia. The Big Three Conference at Moscow (see *YEAR BOOK* for 1945, p. 284) had failed to reach a decision. The British desired that a tripartite commission visit Iran and suggest reforms, but could not get agreement for this suggestion. Meanwhile disorders were spreading in Azerbaijan Province, where the Soviets showed increasing signs of encouraging the local separatist movement.

On January 19 Iran filed formal charges with the Security Council, asking that this body investi-

gate Russia's behavior and recommend a settlement. Six days later the Soviets denied having interfered with Iran's internal affairs or that the latter's attempts to negotiate with Moscow had been fruitless, and they announced their opposition to having these charges debated by the Security Council. The latter body argued the question on the 28th despite the Soviet insistence that no dispute existed. However, on the 30th the Council agreed to the Russian proposal for direct negotiations with Iran, but with the Council continuing to keep an eye on events. At the same time it was announced in Teheran that Russia had surrendered control of the railways in northern Iran.

Meanwhile on Jan. 21 the Hakim Ministry had resigned, to be succeeded by one under Ahmad Qavam-es-Sultanh, seasoned politician and reputedly a friend of Moscow. The Majlis elected Qavam by a vote of 53 to 51 on the 26th. It was with him that the Soviets entered direct negotiations. On February 19 an Iranian delegation under Qavam arrived in Moscow, where they were wined and dined, but apparently made little progress toward reaching an agreement. The Prime Minister returned to Teheran on March 11.

**The Soviets Refuse to Withdraw.** In the interim the deadline for the withdrawal of foreign troops, fixed under the terms of the Anglo-Soviet-Iranian Treaty of 1942 at March 2, had come and gone. The British had evacuated their forces by the stipulated date, but the Russians announced that theirs would "remain in Iran until the situation is clarified." Nevertheless Moscow asserted that Soviet troops were evacuating Meshed and northeastern Iran, though other sources denied this. The British Foreign Office expressed concern and asked for an explanation. In a note of March 6 the United States charged the Soviets with violating their pledge under the 1942 treaty.

The day after Qavam returned to Teheran the mandate of the Majlis expired and the Prime Minister ruled thereafter without it. During one of its last sessions the members of the Majlis had cheered a speaker who asserted that Iran should arraign the Soviet Union before the United Nations Security Council.

Quite a stir was created on March 12 when it was reported that Soviet troops were advancing south and west from the Azerbaijan province of Iran toward Turkey and Iraq, as well as eastward toward Teheran. The Russians denied any such movements and accused "reactionaries" of spreading false rumors. Other reports declared that a Soviet-sponsored Kurdish state had been set up in Iran and that its forces were fighting against the Iranian Army. Amid all this welter of rumor, charge and countercharge—reliable news about affairs in Iran being well-nigh non-existent—former Prime Minister Churchill was in the United States whipping up anti-Soviet feeling.

**The Case Before the Security Council.** Secretary-General Lie revealed on March 19 that Iran's formal charges had been filed, accusing the Soviets of violating the 1942 treaty and interfering in her domestic affairs. The next day saw Russia ask for a postponement of the issue until April 10. The United States wanted it placed first on the agenda. However, on the day before the Security Council met the Moscow Radio announced (March 24) that in agreement with Iran the Soviet government had decided to withdraw all its forces from that country within five or six weeks "if nothing unforeseen occurs." This eased the tension momentarily, though Qavam said there was no such agreement.

When the Council met on March 25 it postponed the Iranian question to the next day. On the 26th the Soviet delegation, threatening a boycott, asked for a two weeks' delay, but was outvoted. On the 27th Andrei Gromyko, the Soviet representative, walked out of the Council while Hussein Ala, Iranian Ambassador in Washington, was given a hearing. Mr. Ala asserted that Soviet demands on his country included the retention of Russian troops in certain parts of Iran for an indefinite period and a recognition of the autonomy of Azerbaijan. Undeterred by Gromyko's abstention, the Council, seeking to get at the facts, asked both Russia and Iran to reveal by April 3 whether or not they had entered into any pact concerning the withdrawal of Soviet troops.

When the Council reconvened on April 3 it received answers from both parties which in substance reaffirmed their previous stands. The Soviet government, however, now stated that it had already begun to withdraw its forces from Iran—this was corroborated by independent sources—and all of them would be out by May 6, without any qualifications or provisos. The next day saw the Council vote to accept these assurances, with Iranian concurrence, but to keep the case on the agenda for the time being.

On April 5 the Soviet and Iranian governments issued a joint communiqué stating that agreement had been reached the day before on all outstanding questions, as follows:

"Red Army troops will evacuate all Iranian territory within one and one-half months from Sunday, March 24, 1946.

"An agreement for the formation of a joint Irano-Soviet oil company and its terms will be submitted to the fifteenth Majlis for its approval within seven months after March 24.

"With regard to Azerbaijan, since it is an internal Iranian affair, peaceful arrangements will be made between the Government and the people of Azerbaijan for the carrying out of improvements in accordance with existing laws and in a benevolent spirit toward the people of Azerbaijan."

It was learned that the oil company's concession comprised a strip of northern Iran, including Tabriz but not Teheran and Meshed. For the first twenty-five years the Iranian share in the joint oil company was to be 49 percent; thereafter, 50 percent. Russia was to bear all the costs of exploration but Iran was to retain title to all lands.

**The Russians Evacuate.** In view of this agreement, the Soviet Government questioned the legality of keeping the question on the agenda. The American delegation disagreed, as did also the Iranian. However, on April 14 Teheran declared that it had faith in the agreement with Russia and instructed Ala to ask that the case be withdrawn from the agenda—which he did on the 15th. But the United States, Britain and five other Council members did not concur, and a vote was deferred awaiting the report of a committee of experts. The latter voted on the 18th that the Council had a right to keep the case on the agenda even if both Russia and Iran asked that it be removed. The Council therefore on April 23 voted 5 to 3 to retain jurisdiction. Russia again threatened to boycott the Council's discussions of the case.

An interesting light on the whole affair was thrown by Michael Foot, a Labour Member of Parliament, upon his return to London on April 21 after a brief visit to Iran. He gave it as his opinion that Russia, not the United Nations, was the real victor since she had in reality attained most of her primary objectives. He also asserted that he had

not been allowed to enter Azerbaijan, where fighting was said to be going on between the forces of the central government and those of the autonomous regime in Tabriz. On April 23 it was reported that Azerbaijan and the "independent Kurdish state" had signed a twenty-year alliance.

The withdrawal of Russian troops from Tabriz was the signal for the autonomous regime of "Prime Minister" Pishvari of Azerbaijan to seek terms with the central government, and he therefore went to Teheran on April 28. The negotiations dragged on through May into June, always reviving after temporary collapses. Finally on June 14 a ten-point program acceptable to both parties was announced. It was summarized in the London *Times* of June 15 as follows:

"The Persian Central Government will appoint the Governor-General of Azerbaijan after receiving nominations from the provincial council.

"The Azerbaijani national army will not be disbanded, but will come under the command of the Persian Army while a commission appointed by the Central Government and the provincial council considers problems arising from the situation. Volunteer forces will be absorbed in the gendarmerie.

"Of the revenue raised in Azerbaijan, 75 percent will go to its own provincial funds and 25 percent to the national funds.

"The Kurds are to have all the privileges of Azerbaijanis and the Kurdish language will be taught in their primary schools. Armenians and Assyrians will also have the same privileges as Azerbaijanis.

"The provincial council will remain until the coming elections for the Majlis (Persian Parliament)."

Meanwhile the deadline for the completion of Soviet withdrawal had arrived on May 6, but no one could say for sure whether or not the Russians were all out. On the 7th the Soviets ignored a United Nations request for a statement concerning their withdrawal, and on the 8th the Security Council voted to keep the question on the agenda. On the 20th Ala told the Council that he could not confirm Russian evacuation and that the Soviets in any case were still interfering in Iranian affairs. But on the next day he officially informed the Council that the Russians had left by May 6 as agreed. This *volte-face* was apparently the result of intrigues within the Iranian Cabinet, where Prince Firouz, a pro-Soviet politician, was known to dislike Ala and his policies. The Iranian Embassy in Washington in fact announced on May 29 that Ala had been instructed to say no more about the Soviet Union to the Security Council.

**Troubles in Southern Iran.** In commenting on the Russo-Iranian oil deal of April 4, Foreign Secretary Bevin told the House of Commons on April 17 that Britain intended to await the evacuation of all troops before entering new oil talks with Teheran. Three months later there was serious trouble in the oil fields of southern Iran, owned by the Anglo-Iranian Oil Co. By July 18 some 100,000 workers were said to be on strike, production was at a standstill, and rioting in Abadan and other centers had led to the imposition of martial law. The whole affair had been sprung with great suddenness and showed careful organization. The Tudeh Party, and perhaps behind it the Soviet regime, were suspected of having been the prime movers. Bevin stated in Commons that he was holding the Teheran government strictly responsible for maintaining order, though in the end it was local officials who settled the strike and restored order before the Qavam

Cabinet could swing into action. Because of the crucial importance to Britain of the oil supplies and refinery equipment of the Anglo-Iranian Oil Co., troops were dispatched from India to Basra in Iraq, across the river from Abadan (see IRAQ). Qavam objected to this move, but on August 9 a spokesman for the British Foreign Office said that his government might find it necessary to move into southern Iran, without waiting for United Nations action, to put down any "violent or sudden" threat to British interests there. The Russians were reported to be massing troops along the northern frontier of Iran, ready to move in if the British led the way. Happily this crisis was surmounted without any international violence.

In mid-September reports of an uprising began to seep out of Fars province in southern Iran. This revolt, led by Nasir Khan of the powerful Qashqai tribes, was apparently aimed at driving the leftist (Tudeh) element out of the Cabinet—to which it had been admitted on August 1—and at acquiring local autonomy such as that already granted to Azerbaijan. The Central Government saw the British behind this insurrection and demanded the recall of C. A. Trott, Oriental Secretary at the Embassy in Teheran, whom it accused of complicity. The British government denied this accusation.

After three weeks of fighting in which Bushire and several other places were taken by the rebels and Shiraz was surrounded, a truce was arranged on October 6. In a communiqué issued on the 17th it was announced that the rebels had agreed to cease hostilities in return for provincial autonomy, a larger representation in the Majlis, an extension of the railway into Fars province, a general amnesty, and other demands. Two days later Qavam dropped the Leftist members of his Cabinet, thus ending the coalition formed during the summer.

**The "Reoccupation" of Azerbaijan.** In the spring the Qavam ministry had postponed the elections until the country should be free of foreign troops. On April 24 the appointment of an electoral council was announced whose function it was to see that the elections were "absolutely free, with no pressure exerted by foreign or other hands." This body met on May 25 and Qavam told it that elections must be held as soon as the Azerbaijan problem had been settled. On June 28 he revealed the formation of a new Democratic Party and made threats against "reactionaries." Two days later the Tudeh Party reported that it had formed a coalition with another leftist group. On August 1 Qavam presented his new cabinet, containing three Tudeh members. But after these had been dropped in October following the revolt in Fars, the leftist groups denounced Qavam as a "reactionary" and six of them banded together in a "United Freedom Front."

Having thus clarified the political situation, Qavam decided to get rid of the Communist-dominated regime in Azerbaijan. Apparently he had discovered that the Soviet Government was no longer prepared to give effective support to its puppet regime at Tabriz. At any rate, in mid-November the Iranian Army began moving toward Azerbaijan, where they were ordered to supervise the elections set for December 7. The Tabriz regime countered with a threat to declare its independence, but was unable to make good on it. There was a brief civil war, but by December 11 Pishvari had capitulated and on the 13th government troops entered Tabriz. At the same time the Central Government put an end to the Kurdish "republic."

These events were regarded as a severe blow to Soviet prestige and to the position of the Tudeh

party. The latter chose to boycott the elections, which had been postponed once again, and the leftist forces in Iran went underground.

**The Country and Its Economy.** By and large Iran is a barren country abounding in vast deserts and steppes where only a sparse nomadic population can obtain sustenance. Yet much of its soil is fertile and only awaits irrigation. Despite these unfavorable conditions Iran is essentially an agricultural country producing a wide variety of grains, fruits and livestock. One of the factors holding back agricultural progress is the fact that two-thirds of the land is in large estates. Under this feudal system small landowners constitute only a small minority of those tilling the land. The principal agricultural products are wheat, barley, Indian corn, rice, many varieties of fruit, tea, tobacco, cotton and silk. Cattle, horses, donkeys and camels are also bred extensively. Persia has long been a principal producer of the poppy from which opium is derived.

Industrialization has already begun in a small way with the production of such goods as textiles, carpets, glass and sugar. As a consequence there is arising an industrial proletariat in some of the larger cities.

Many of the mineral deposits have been only partly explored and are largely undeveloped. Oil is by far the most valuable mineral product now exploited in the country and the international competition for its control has kept Iran in intermittent danger of losing her independence for forty years. In southwestern Iran the Anglo-Iranian Oil Company has a large concession on which oil is produced, piped to refineries at Abadan on the Shatt-el-Arab and exported in large quantities. In 1941 Iran ranked fourth among the oil-producing countries of the world with an output of 6,708,000 metric tons. By 1945, under the impetus of war needs, the production of the Anglo-Iranian Oil Company had reached 16,839,490 tons. New refinery capacity, including facilities for producing high-octane aviation gasoline, had also been installed. The company employed 65,000 Iranians and Abadan had become a city of 120,000 inhabitants.

The two principal ports on the Persian Gulf are Khorramshahr and Bandarshapur. The main line of the Trans-Iranian Railway was completed in 1938 from Bandarshapur through Teheran to Bandarshah on the Caspian Sea, a distance of 865 miles. Though this was one of the engineering triumphs of the 20th century, some of the line had to be rebuilt in order to transport Lend-Lease material to the Union of Soviet Socialist Republics during the recent war. Branch lines have been started towards Tabriz, Meshed and Yezd, but none of them is as yet completed. Southern Iran lies along the routes used by the principal airlines between Europe and India.

ROBERT GALE WOOLBERT.

**IRAQ (Iraq).** A kingdom occupying the lower and middle parts of the Tigris and Euphrates river basins, frequently referred to as Mesopotamia. Its area is 116,600 square miles. Capital, Baghdad.

**Characteristics of the People.** The estimated population in 1935 was 3,560,456. Over 3,000,000 of these were Moslems; 101,375 were Christian, including Orthodox, Catholics, Protestants and a few remaining Assyrians; and 90,970 were Jews. The official language, spoken by the great majority of the people, is Arabic. However, on the northern and eastern frontiers there are Kurdish and other minorities which jealously preserve their cultural identities.

According to law primary education is free and compulsory, but the law is not enforced everywhere. Recent statistics show 897 elementary schools, 76 private primary schools, 69 intermediate and 897 secondary schools. By far the great majority of these institutions are for boys, though the education of girls has been making marked progress in Iraq during recent years. There is a university in Baghdad, and colleges of engineering, medicine, pharmacy, teacher training and law, as well as technical schools of agriculture, nursing, etc.

**Government.** The reigning king is Faisal II, who succeeded to the throne after the death of his father, King Ghazi, on April 4, 1939. During the King's minority, affairs are in the hands of a Regent, Emir Abdul Illah. The Class A Mandate, under which Iraq had been governed following the First World War, terminated in 1932 when the country achieved its juridical independence and became a member of the League of Nations. Iraq was the first of the mandated areas thus to acquire its freedom as promised in the Covenant of the League of Nations.

The Constitution provides for a limited monarchy and a responsible government. The legislature consists of a Senate of twenty elder statesmen nominated for eight-year terms, and a Lower House comprising 115 elected Deputies. For administrative purposes the country is divided into fourteen liwas. The army was reorganized after the pro-Axis revolt in which certain elements of the army had participated in 1941. The police force is under British technical supervision.

**Events, 1946.** The year was marked by considerable ministerial instability. On January 30 the resignation was announced of the cabinet of Hamdi el Pachechi. His government was characterized as too dilatory in instituting the social reforms in which the Regent, Prince Abdul Illah, had become interested during his recent trip to the United States. Some progress in this direction had already been made with the repeal of the prohibition on political parties and labor unions.

Meanwhile the Kurds in northeastern Iraq continued to cause anxiety in Baghdad, particularly since it was feared that the rebel leader Mustafa el Barzani might return from Iran with Soviet support. The new premier, Tewfik Suwaidi, declared in Cairo on March 24 that in reality the Kurds presented no problem because they enjoyed equal rights in Iraq. However, in early April Kurdish sources reported that reinforcements of Iraqi troops had been ordered into Kurdish territory northeast of Kirkuk. These troops along the Iranian frontier were inspected by the Regent, who was doubtless apprehensive over the possibility of Soviet intervention, at that moment very evident in the neighboring Iranian province of Azerbaijan.

The Suwaidi Ministry resigned on May 31, its fall being attributed to its weakness on the Palestine issue and to its slowness in negotiating a revision of the treaty with Great Britain. In this connection it should be mentioned that on April 9 it was announced that the Anglo-Iraqi financial agreement had been renewed for a year. Under this arrangement Iraq was to be allowed \$14,000,000 from the British sterling pool and in return would accept sterling for British purchases in Iraq.

The new cabinet was led by Arshad el Umari, who had served as Mayor of Baghdad, foreign minister, and delegate to the San Francisco Conference. It contained three Kurds, in accord with the usual practice of giving representation to this important minority. One of the new Government's early acts was to approve a ten-year plan for the

reconstruction and development of the country's irrigation system, its health and sanitary facilities, its schools and the like. On July 1, Dr. Ihsan Dogramaji, Iraqi health delegate to the United Nations, declared in New York that his country needed financial assistance in order to combat such scourges as malaria, tuberculosis and infant mortality.

On July 3 a strike broke out among the workers in the oil fields around Kirkuk over such issues as wages and housing. It was settled by the 18th, but not before several persons had been killed in clashes between workers and police. No doubt impelled by these events, the Government suppressed twelve leftist newspapers and arrested twenty members of the unauthorized National Democratic Party on charges of engaging in Communist activity.

This fear of Soviet infiltration southward from Azerbaijan was not confined to the Iraqi government. Britain, too, had reason to suspect that Russia had designs on southern Iran with its all-important oil fields and refineries, owned and operated by the Anglo-Iranian Oil Co. (see IRAN). On August 2 the Indian government announced that troops were being sent to Basra in order to guard these oil installations across the Shatt-el-Arab in southern Iran. Indian public opinion was openly critical of this move, and the Iranians protested. Nevertheless by August 10 a heavily armed and mechanized Indian division was at Basra, ready to move into Iran. Soviet sources such as the Moscow radio tried to make political capital out of these measures, accusing the British among other things of stationing 80,000 troops in Iraq—a charge branded by the British as utterly fantastic.

Iraq continued to play its part in the Arab League, though not always as actively as some of the more advanced Pan Arab elements could wish. There were also suspicions that the Government was reorienting its policy toward Turkey and Iran, along the lines laid down in the Saadabad Pact. In January a delegation under Nuri-es-Said, former Prime Minister and at that moment President of the Senate, left for Turkey to engage in political and economic talks. In March Premier Suwaidi stated that these conversations were not general but dealt only with clearly defined subjects. He admitted that the Saadabad Pact was still in force but denied that it constituted an "eastern bloc" opposed to or competing with the Arab League.

Upon at least two occasions during the year there was public discussion, by responsible leaders, of the proposal for federal union between Iraq and Trans-Jordan in certain limited fields such as foreign affairs, defense and finance (for details see TRANS-JORDAN).

The government of Arshad el Umari, which resigned in mid-November, was succeeded by one led by Nuri Pasha, who thus took the office of Prime Minister for the sixth time. At the same time the Regent dissolved parliament and called an election, the first to be held under the new law with its broader franchise. Nuri, one of the founders of the Arab League, sought to allay suspicions concerning the much-bruited project to create a "Greater Syria" by declaring that the "Syrian people alone will determine the future of Syria."

It was announced in Washington on November 23 that the American Legation in Baghdad would be elevated to an Embassy. The new American Ambassador was George Wadsworth, for many years a United States Foreign Service Office in the Middle East.

In December the Standard Oil Co. of New Jer-

sey and the Socony-Vacuum Oil Co., who together owned 23½ percent of the Iraq Petroleum Co., announced that they were planning to increase their investments in Iraq, primarily in order to double the capacity of the pipeline to the Mediterranean. They also made known their intention to purchase large quantities of crude oil, in both Iraq and Iran, from the Anglo-Iranian Oil Co., in order to take care of their expanding markets for oil products in Europe and North Africa.

**The Country and Its Economy.** Iraq is the land of the Biblical Garden of Eden. It has rich agricultural potentialities which could be realized by extensive irrigation and drainage works. At present about 10 percent of the area of Iraq is cultivated; 20 percent is potentially arable; 8 percent is mountainous; 5 percent consists of flooded areas, swamps and lakes; while 66 percent is desert or steppe country. In the north wheat and barley are important crops and sheep-herding is extensive. In the lower delta region some 80 percent of the world's total output of dates is grown.

The country's most valuable export is petroleum, which is produced at several places in northern Iraq. The principal oil field is at Kirkuk, which is connected by pipelines with the Mediterranean ports of Tripoli and Haifa. In 1942 oil production totaled 16,500,000 bbl. The Iraq Petroleum Company, which exploits the Kirkuk field, is controlled by an international group in which British, American and French interests have been represented.

In 1944 imports were valued at 14,218,361 dinars, and exports (exclusive of oil) at 9,488,409 dinars. Basrah, on the Shatt-el-Arab, is the country's principal port. At the beginning of the recent war the standard gage railway which had long been projected to connect Baghdad with Syria and Turkey—the old Berlin-to-Baghdad line—was finally completed. There is also a metre-gauge line from Basrah to Baghdad, and thence to Kirkuk and Khanaqin. Highway communication with Iran is maintained from the latter point. Altogether there are nearly 1,000 miles of railway in the country. There are also over 1,200 miles of good highway, including the routes from Baghdad to Damascus and from Baghdad toward Trans-Jordan and Palestine.

Iraq lies athwart the principal air lines running from Europe to India and the Far East. Before the war intercontinental services via Iraq were supplied by the British, French and Dutch.

ROBERT GALE WOOLBERT.

**IRELAND, Northern.** A part of the United Kingdom, consisting of six counties and two parliamentary boroughs in northern Ireland (Ulster). Area: 5,238 square miles. Population (1937 census): 1,279,745. Capital: Belfast.

**The People.** The latest available figures show religious affiliations as follows: 33 percent Roman Catholic, 31 percent Presbyterian, 27 percent Church of Ireland, and the remaining 9 percent in smaller denominations or unclassified. Educational facilities include elementary, secondary and technical schools, with the Queen's University of Belfast at the apex of the structure. The social insurance system operates as it does in Great Britain.

**The Economy.** Considerable attention was given to the problem of reviving the Irish linen industry, in peace times the British Isles' second industry with respect to exports to America and an employer of 70,000 persons. For a number of reasons the business was not able to meet the demands of North and South American buyers, especially for handkerchiefs and table linen. Linen had suffered

from the British Board of Trade's prolonged direction of the greater part of its output into utility goods (standardized goods of good quality but low price, prescribed by the British Government to ease consumer shortages). The manufacture was less attractive than formerly to Irish girls who had known wartime pay in munitions factories.

The traditional bases of Northern Ireland's industrial structure, in addition to linen, are agriculture and shipbuilding. Agriculture is the largest single industry, with cereal grains, potatoes and flax as the chief crops. Shipbuilding, like linen, is centered in Belfast.

**Government.** Although Northern Ireland is an integral part of the United Kingdom and is represented by 13 members in the British House of Commons, the country exercises a degree of local autonomy through a Parliament of its own and a Cabinet responsible thereto. The Parliament consists of a Senate of 2 ex-officio and 24 elected members and a House of Commons of 52 members, all elected. In 1946 the Unionist Party was in power, as a result of the 1945 election, and all members of the Cabinet were Unionist. Prime Minister: Sir Basil S. Brooke.

**Events, 1946.** Early in the year the Government of Northern Ireland took steps to centralize its transport system. In a White Paper issued January 8 it was explained that it had been decided that the only way of obtaining an efficient and solvent public transportation system was to merge into a single undertaking the Road Transport Board, the Belfast and County Down Railway, and the systems of the London, Midland and Scottish Railway and the Great Northern Railway (Ireland) operating in the country.

Like many other countries released from war pressure, Northern Ireland went through a number of disturbing strikes in the course of the year. A strike of bank officials who went out on July 12 lasted until August 16. The strikers, whose issues were higher pay and speedier machinery for negotiation, were awarded compromise terms at a conference called by the Government.

When bread rationing went into effect in Britain and Northern Ireland in July the Northern Ireland delivery workers voted against cooperation. This rebellion, which affected some three-fourths of the 6 counties' population, was the only widespread resistance encountered in the United Kingdom. British troops delivered bread in Northern Ireland until the revolt subsided.

The armed services entered the situation again in November, when a bakers' strike for higher wages began on the 23rd of the month. Many army bakers were flown from England to bake bread for Northern Ireland. Considerable hardship was nevertheless caused to the public, and on that basis the bakers went back to work on December 1, with the promise that the negotiation machinery would be used immediately and that military bakers would be withdrawn as soon as possible.

Northern Ireland continued to share with Eire the problem of the outlawed Irish Republican Army (IRA) and its hunger strikers. David Fleming, 28-year-old IRA veteran held in a Belfast prison, went on two hunger strikes in 1946, one for 77 days and the other for 45. At the end of the second he was sent to Eire and forbidden by the Northern Ireland authorities to enter the country for at least 8 years. Authorities in Northern Ireland, as in Eire, defended the treatment given IRA prisoners and declined to make concessions to the demand for their release (See article on EIRE).

ALZADA COMSTOCK.

**IRON AND STEEL.** Inability of steel mills to meet an unprecedented peacetime demand made shortage of steel a major factor limiting production of civilian products in 1946. A month-long strike in the steel industry, and two coal strikes (see COAL) hobbled production during three distinct periods, but during the balance of the year output was close to peak wartime rates. Ingot production was 66,363,848 tons (1945: 79,701,624 tons).

Pent-up demand for automobiles, household appliances, machinery farm and railroad equipment, buildings, and industrial goods, following nearly four years of war, created such a heavy demand for steel that distribution, virtually released from government control, was informally rationed by the mills. Although steel production was greater than in any peacetime year, orders piled so high that deliveries were quoted from six months to as much as two years ahead.

Relatively few changes were required in steel facilities to shift from the products of war to those of peace. Operations were high when, on January 21, the United Steel Workers of America (CIO) declared a strike against steel-making and steel fabricating plants in which it was the recognized union bargaining representative. About 95 percent of the nation's steel capacity was shut down until a settlement was reached, effective February 15, making the strike the most far reaching in the industry's history. Major issues were wages, the union demanding 25 cents per hour increase. United States Steel Corp., bellwether of the industry in labor negotiations, offered an increase of 15 cents per hour which was rejected by the union. This impasse was broken when both the company and the union accepted settlement on the basis of 18½ cents per hour following intervention by the White House. This settlement provided a pattern, not only for the steel industry, but for many other industries in subsequent wage adjustments. It was estimated that 6,000,000 tons of steel ingot production was lost as a result of the strike.

Steel-making had not yet gained full momentum when coal was shut off by a nationwide bituminous coal mine strike starting April 1. (Coke, produced from bituminous coal, is the essential fuel and reducing agent in the reduction of iron ore to pig iron in the blast furnace.) The steel industry husbanded its coal supplies, and had cut its steelmaking operations to 44.5 percent of capacity by the end of the strike June 1.

Effects of these two strikes, and later of the railroad strikes lingered far after the period of the actual work stoppages. Technical considerations, involved in starting the production flow of steel after a shut-down, mean a lapse of three weeks or more before finished products are ready for shipment in quantity. Steel users in many cases were forced to shut their plants for lack of vital steel products, long after the strikes had ended, because of depleted inventories and failure of new stocks to arrive on schedule. A second coal strike from November 21 to December 7 caused another dip in steel output.

Scrap iron and steel remained scarce during the year, threatening to restrict the production of new metal, and in a few cases actually holding down operations. (Scrap steel is melted and refined with pig iron, or in some plants alone, to make new steel.) Some 42,000,000 long tons were used by the steel industry in 1946. This scarcity was attributable to the wartime products of the steel industry not returning as scrap, and to the small quantity scrap being generated currently by civilian manufacturing and disposal of old products.

Mining of iron ore and its shipment to the mills also was hampered by labor disputes, notably in the underground mines of upper Michigan and on ore-carrying vessels of the Great Lakes. Mine production of iron ore in the United States was approximately 72,500,000 tons (1945: 88,754,000 tons), nearly 80 percent of it from the open pit mines of the Mesaba Range in Minnesota.

No large new steel plants were constructed during the year despite the heavy demand for steel, the industry fearing that a later recession would leave it with expensive excess capacity. However, several important additions were underway to increase facilities for certain products, notably sheets for automobiles, home appliances and similar goods.

Important to rapidly expanding steel-using industries in the Far West was the sale by the government of the big Geneva, Utah, steel plant, constructed during the war, to Geneva Steel Co., a subsidiary of United States Steel Corp. At the end of the year, modifications were underway at this plant, built to serve West Coast shipbuilders, so that its products would more nearly meet the needs of civilian industry.

Production of pig iron for steel making and castings was 45,378,530 tons (1945: 53,454,872 tons). About 47,500,000 tons of finished steel products were made (1945: 62,246,468 tons). Gray iron foundries turned out about 8,900,000 tons of castings (1945: 9,578,295 tons).

Distribution of the types of steel products produced reverted during the year to the peacetime pattern prior to the outbreak of war in Europe. About 45 percent of the total tonnage was in the so-called "light" products category, used chiefly in the manufacture of consumer goods. From October, 1941, to October, 1945, light products accounted for less than 40 percent. In this group are sheet and strip steel, tin and terne plate, wire and wire products, black plate, conduit, and light tubing. Most notable was the heavy tonnage going to the construction industry, both directly and indirectly, representing about one-seventh of total consumption. The automotive industry, normally the peacetime leader, would take a smaller proportion than construction, it appeared, followed by containers, railroads, and machinery. Shipbuilding and ordnance, leading wartime consumers, required insignificant tonnages in 1946.

Alloy steel production amounted to some 6,056,438 tons, about nine percent of the total. This represents a sharp drop from 1943, when 13,116,000 tons (14.8 percent of that year's total), were produced, but is a significant increase from 1939 when 3,212,000 tons (6.1 percent) were made.

Prices of individual steel products, under Office of Price Administration control, had only one broad rise during the year. Following an increased wage level after the steel strike, a price increase averaging \$5 per ton on carbon steel products was authorized on carbon steel products and alloy steels. Minor individual adjustments also were made on individual items for certain high cost producers. However, a larger proportion of high priced items were produced during the year with the result that a price average weighted according to the proportionate tonnage of each item produced showed a sharp advance. The weighted price of foundry pig iron advanced from \$25.37 to \$30.14 per gross ton, according to *The Iron Age*.

A comparison of finished steel composite prices, according to *The Iron Age* may be seen in the following figures (prices quoted are cents per pound): 1935: 2.06779; 1936: 2.11814; 1937: 2.53620;

1938: 2.45874; 1939: 2.31088; 1940: 2.30096; 1941: 2.30467; 1942: 2.28249; 1943: 2.29176; 1944: 2.27298; 1945: 2.42277; 1946: 2.67544. The 1935-39 average: 2.29835¢ per pound. The index varies with the base price of key steel products and also with the quarterly distribution of the various items included in the composite.

CHARLES T. POST.

**ITALIAN LITERATURE.** Some ray of hope, if not positive liberation, was felt in 1946 along the *via dolorosa*, tread upon by Italian letters, during the war-weary years and their aftermath. Left momentarily stunned and out of breath, our Italian literati, after long years of literary and political servility, once again began to punctuate the European and international panorama with creations such as Curzio Malaparte's stirring *Kaputt* and Alberto Moravia's brilliantly narrated *Agostino*. Italy has always had remarkable recuperative powers, to which any student of history will readily attest. And in this respect, Doctor V. Ivelia, cultural attaché at the Italian Embassy, gave the compiler of this article positive assurance that the Italian Press was rising anew in a glorious pattern, that a new and potent Italic voice would be heard from the rubble heap and political decay of Europe. All this, despite the utter poverty of the Italian publishing houses, and the complete lack of paper, printing facilities, etc.

Of particular interest to professional Americans no doubt is the information that some of the time-honored publishing houses survived and were extremely active in the face of insurmountable obstacles and difficulties. For instance, Fratelli Treves continued under the aegis of Aldo Garzanti. The up-to-date and enterprising house of Mondadori of Milan set out an impressive array of publications characterized by beautiful type, printing, and formats. The reliable and scholarly house of Giuseppe Laterza of Bari, known especially for its magnificent and exhaustive collection on the History of Italian Literature, continued its work with the interest and cooperation of Benedetto Croce. The curious and ever daring publisher, Bompiani, known in America especially for his entertaining and informative *Almanacco Letterario*, among other preoccupations, entered the field of encyclopedias. Of interest, too, no doubt is the information on the continuance of some notable prewar reviews and the appearance of new ones. *Nuova Antologia*, one of the oldest and most scholarly reviews in Europe survived and is to continue. The ever-popular *L'illustrazione Italiana*, an illustrated weekly, was available and *Leonardo*, published by Sansoni from 1932 was scheduled to reappear in 1946 as a bi-monthly under a new policy and different format. *Mercurio* under the able editorship of Alba de Céspedes came out regularly with a list of contributors to dazzle any follower of Italian Literature—Ignazio Silone of *Bread and Wine* fame, Alberto Moravia, author of the sensational *The Indifferent Ones*, Corrado Alvaro, the poets Giuseppe Ungaretti and Gabriela Mistral, Chilean, 1945 Nobel prize winner. *Mercurio* should be congratulated for its auspicious achievements, and may it have a long life indeed! *Teatro* brought out its fifth issue (June 1946) showing excellent taste in its preparation and materials. Its companion review on the theatre, *Il Dramma* continued its new series (August 1946). Among new reviews appearing on the Italian horizon may be mentioned at random: *Letteratura* issued bi-monthly; *Belfagor*, a review on the humanities, published monthly; and *Anglica*, a bi-monthly review on English and American studies under the editorship of Prof. G. N. Orsini.

**Fiction-Drama.** Vitaliano Brancati captured the public fancy with two widely read books, *Il vecchio con gli stivali* (Bompiani, Milan), a collection of stories, and a novel, *Don Giovanni di Sicilia* (Bompiani, Milan). *Il vecchio con gli stivali* (*The Man With the Boots*) is the title of the first story, or rather, a novelette, which deals with the life of a provincial clerk helplessly sucked into the fascist code of public behavior and listlessly going through the mock-heroic poses and antics. Facetiously treated, the novelette may be called a subtle travesty on provincial fascism in which the hero, Piscitello, is representative of thousands of other helpless individuals drawn into the party in quest of bread for their families. Brancati has shown himself master of patterns in literary malice in these two volumes (*Don Giovanni* in *Sicilia* reached its sixth edition the past season) and bids fair to become a leading humorist in Italy. Another author that came sharply to the fore in Italy and elsewhere, was Curzio Malaparte, publishing *Don Camaleone*, *The Novel of a Chameleon* (Vallecchi, Florence) composed of some articles and installments contributed to *La Chiosa* (1928). *Don Camaleone* is a politico-literary document on Mussolini and Fascism, couched in a symbolic style suggestive of Voltaire, Swift, and still more closely, Anatole France. And now, turning to Malaparte's *Kaputt*, widely read in Europe the past season (English version by Cesare Foligno; E. P. Dutton & Co., Inc., New York) it may be said that it will undoubtedly take its place as one of the great books to emerge from this war. In the form of memoirs, it is the faithful recording of the lurid and sadistic Nazi brutality that accompanied the early victories in 1940-1943. Alberto Moravia reappeared very much on the literary scene with three books, *Agostino*, *L'Epidemia*, and *Due cortigiani*. Of the three volumes, *Agostino* (Bompiani, Milan), more fittingly falls into the 1946 discussion. It is a touching psychological study of the adolescence of a thirteen-year-old boy.

In the drama, reference should be made to the new plays published in the monthly magazine *Teatro* and the bi-monthly *Il Dramma*. For example, the June issue of *Teatro* published *La Frontiera* of Leopoldo Trieste and also Jack Aldridge's *Tutto questo è finito* (*All This Is Ended*), translated by Clara Falconi. *Il Dramma* brought out a version by Paulina Vecchiotti of John Steinbeck's *The Moon Is Down*, *La luna è tramontata* and the September issue of the same review offered Ugo Betti's *Il vento notturno* (*Nocturnal Wind*), and *Puntate su domattina*, an Italian version of William Saroyan's *The Beautiful People*.

**Poetry and Varia.** Two books may be singled out for cultists of Leopardi and Foscolo. Francesco Biondolillo assembled selected prose and poetry of Giacomo Leopardi, *Canti e prose scelte*, a revised and more complete anthology on the famous poet which Biondolillo prepared from his earlier opus (1924). Giuseppe Troccoli brought out a scholarly volume on *Liriche e prose* of Ugo Foscolo. Both texts having introductions, commentaries and studious annotations, are contained in the collection "Biblioteca di Classici Italiani," decorously published by Vallecchi Editore of Florence. The poet Giuseppe Ungaretti translated in his series *Vita d'un uomo* the fourth volume, *40 Sonetti di Shakespeare* (Mondadori, Milan). Ever enterprising Bompiani brought out two handsomely printed, beautifully and profusely illustrated volumes, *Enciclopedia Pratica Bompiani*, costing in the neighborhood of \$30, in its convenient and handsome edition. Incidentally, some sets still survive of the

monumental *Enciclopedia Italiana* (Istituto Treccani) in 37 volumes, and one supplementary. Though its price runs well into the hundreds, the encyclopedia may become a collector's item.

O. A. BONTEMPO.

**ITALIAN SOMALILAND (Somalia).** This is the largest, most populous and most promising (economically speaking) of the four Somalilands. It has approximately 1,200,000 inhabitants and an area of some 194,000 square miles. After the Fascist conquest of Ethiopia it was enlarged and incorporated (June, 1936) into newly created Italian East Africa. Reduced to its original boundaries, Somalia has since 1941 been under British Military Administration, and few Italians now remain in the colony.

The Italians developed several plantations along the Webi Shebeli and other streams, raising bananas, cotton, sugar, kapok, etc. The natives engage largely in the usual Somali pursuit of stock-raising, with agriculture being important only in the southern and less desertic part of the colony. The Italians constructed a railway from Mogadishu (the capital) to the Villaggio Duca degli Abruzzi (70 miles), as well as several hundred miles of good highway, and an artificial harbor at the capital where the monsoons had hitherto interfered with port operations.

**Events.** The disposition of Italian Somaliland, as one of the spoils of war, was under discussion throughout much of the year by the Council of Big Four Ministers, by their Deputies, and by the Luxembourg Conference of the 21 Powers which had declared war on Italy. Though much debated, the question was not settled, being postponed until 1947. The Big Four, however, accepted on July 3 the principle that Italy must be obliged to renounce sovereignty over all her colonies in Africa. (For further details see LIBYA.) On April 29 Foreign Secretary Bevin had told the Council of Ministers that all the Somalilands, including Somalia, would best be administered as an economic unit. The Ethiopian government reacted at once against any suggestion that its part of Somaliland—the Ogaden—should be detached from Ethiopia. It feared that Bevin's proposal meant the permanent loss of this area, where in fact the British Military Administration, imposed in 1941, still persisted through 1946. The Soviet trade union organ *Trud* also attacked Bevin's suggestion as involving an expansion of the British Empire, expressly forbidden in the United Nations Charter.

Late in the summer a demonstration in Mogadishu, occasioned by a wide but unfounded fear that new taxes were to be imposed, resulted in bloodshed before the misunderstanding could be cleared up.

ROBERT CALE WOOLBERT.

**ITALY.** A republic of southern Europe. On June 2, 1946 a referendum changed Italy from a monarchy to a republic. Provisional President: Enrico de Nicola (elected June 28, 1946). See *Events* below.

**Area and Population.** Italy had an area of 119,764 square miles (1936). Population (October 31, 1943): 45,637,000, compared with (1936 census) 42,993,602. There were 67,063 emigrants during 1940. Vital statistics (rate per 1,000; based on January-June, 1943): 20.5 live births, 14.2 deaths, 5.6 marriages. The infant mortality rate (deaths under one year per 1,000 live births) was 108 for 1942.

Rome, the capital, had an estimated population of 1,480,253 on March 1, 1943. Other important cities (with estimated populations on Jan. 1, 1939

exclusive of workmen and soldiers in the Dodecanese and in Africa) were: Milan, 1,205,542; Naples, 920,460; Turin, 690,015; Genoa, 654,211; Palermo, 431,666; Florence, 351,055; Bologna, 315,158; Venice, 283,926; Trieste, 258,612; Catania, 251,978; Bari, 210,777; Messina, 202,375; Verona, 166,315; Padua, 150,203; Taranto, 151,150; Leghorn, 134,545; Brescia, 134,340; Ferrara, 122,913; Reggio di Calabria, 121,876; Cagliari, 119,934; La Spezia, 119,067.

**Colonial Empire.** When Italy entered World War II as an Axis partner of Nazi Germany, it had an overseas empire (including Albania and Libya) of 1,279,589 square miles with an estimated population of about 14,186,400. By the end of 1943, the Italians had lost effective control of the whole of their overseas empire. British and Allied forces occupied Eritrea, Ethiopia, and Italian Somaliland in 1941 and Libya in 1942-43. During 1943 and 1944 Albania and the Italian Aegean Islands as well as the territories annexed from Yugoslavia were occupied by either Allied or German troops. After the unconditional surrender of Germany in September, 1945, all Italian territory occupied by German troops passed into Allied control.

**Education and Religion.** School enrollment in 1937-38 was: elementary, 5,051,306; secondary (including technical and art), 613,588; higher education (1938-39), 77,429. One out of every five adults is illiterate. According to the census of 1931 there were 41,014,096 Roman Catholics (99.6 percent), 83,618 Protestants, and 47,825 Jews.

**Production.** About 46.3 percent of the working population was engaged in agriculture and fishing in 1939, 30.4 percent in mining, quarrying, and industry, 8.3 percent in commerce, and 4.6 percent in transportation. The wheat harvest was estimated at 4,180,000 metric tons—the smallest crop since 1920 and roughly two-thirds of the 1944 wheat crop. The output of barley, oats, and rye in 1945 was about two-thirds of the 1944 output. The 1945 corn crop was normal at 230,000 tons. Rice produced in 1945 was estimated at 400,000 tons which was below the normal yield. Dry legumes (beans, peas, and broad beans) suffered heavily. The 1945 olive crop was estimated at 950,000, and the output of grapes, other fruits, and vegetables was good. Other important crops are sugar beets, cotton, linseed, flax, and raw silk.

Mineral and metallurgical products included petroleum, coal, pyrites, sulfur, iron ore, pig iron and ferro-alloys, steel, lead, zinc, bauxite, aluminum, quicksilver, and silver, textiles, rayon and staple fibers, refined sugar, cheese, and macaroni are important industrial products. In 1941 the output of electric current amounted to 21 billion kwh.

**Foreign Trade.** Publication of official trade statistics was suspended after Italy entered the war. However, unofficial figures indicated that imports in 1940 totaled 12,908,000,000 lire (9,938,000,000 in 1939) and exports 9,244,000,000 lire (8,160,000,000 in 1939). These figures exclude trade with the Italian colonies.

**Finance.** Budget (1944-45): revenue 12,938,000,000 lire; expenditure 129,071,000,000 lire (ordinary 33,658,000,000 lire, extraordinary 95,413,000,000 lire). War expenditure for 1944-45 (included in the foregoing figures) totaled 32,700,000,000 lire. The minister of reconstruction on October 24, 1945, summarized the financial situation of Italy as including a public debt of about 1,000 billion lire, a current budget deficit of 350 billion lire, and a total currency circulation of 350 billion lire.

**Transportation.** In 1941-42 there were 14,448 miles of railway lines, and 128,830 miles of roads.

Shipping in control of the Italian merchant marine on Sept. 1, 1945, totaled 500,000 gross tons; in addition 300,000 tons of that sunk in Italian ports or along the Italian coast during World War II was considered salvageable. On June 10, 1940, Italian shipping totaled 3,537,000 gross tons, of which 900,000 tons were in enemy and neutral ports.

**Events: Via Dolorosa.** Defeated and impoverished Italy in 1946 ceased to be a Kingdom and became a Republic. It also acquired, through protracted negotiations among the victors, a peace treaty, concluded in all its essentials but not yet signed at the close of the year. For the rest, its people experienced stark want, inflation, black markets, exploitation at home, humiliation abroad, and numerous other evils spawned by the black past and nourished by the gray present.

**Fascism: Old Style.** "Il Duce is again among us. His mortal remains have been taken in custody by the Democratic Fascist Party." So read the letter of April 22, 1946, left beside the unmarked pauper's grave in Milan's Maggiore Cemetery where the bullet-riddled, mutilated body of Benito Mussolini had been interred on April 30, 1945. The cadaver was gone. The identity of the thieves was never established. On July 25, third anniversary of Mussolini's fall from power, all his properties were confiscated by court order on behalf of the Italian people. Under a recent amnesty his nephew, Vito, was released from a Naples jail where he was serving a 12-year term. On August 12, the body of Il Duce was reported by the Milan police to have been found in a trunk in the Pavia Monastery. One of the three thieves, said Father Alberto Parini, had confessed to the theft and had authorized him to disclose the secret. The body was believed to have been reburied in Milan in sacred ground and in a place unknown to the public.

The ghost of Fascism still walked. Reports from Rome in March held that a well-organized and armed Fascist underground existed in the capital, directed by Carlo Scorza, former Secretary of the Party. It was alleged to be subsidized from Franco Spain and to be protected by certain elements in the Catholic clergy. At the end of March unidentified aircraft were reported to be dropping small radio transmitters to obscure conspirators in central Italy. Five Fascists seized the station of the Rome radio on May 1 and broadcast the Fascist anthem, "Giovanezza." On September 3 the Paris Peace Conference accepted a recommendation of its military commission that Italian Fascist militiamen and members of Mussolini's "Republican" forces be permitted to serve as officers in the new Italian armed forces if "exonerated by the appropriate body under Italian law." Early in October crowds giving Fascist salutes and shouting "Duce! Duce!" broke up a demonstration in Gorizia by the Italian-Slovene anti-Fascist Union.

On November 18 Col. Gen. Eberhard von Mackensen and Lt. Gen. Kurt Maelzer went on trial before a British tribunal in Rome for their part in the Ardennine Caves massacre of March 24, 1944, when 335 Italian hostages were slaughtered in reprisal for the killing of 32 German soldiers by a bomb attack in Rome. Both pleaded "not guilty," but were sentenced on November 30 to death by shooting, to the general satisfaction of the Italian populace.

**Fascism: New Style.** On January 2, 1946, the public prosecutor announced the seizure of Guglielmo Giannini's weekly, *L'Uomo Qualunque* for an editorial which declared: "If you can get away with it, split the head of anyone who calls you a Fascist." Giannini, a former member of the Fascist

party, continued to denounce "politicians" and agitate for an "Administrative State" and a "United States of Europe." His efforts to convert his movement into a political party fell short of his predictions, but netted his candidates a million votes in the election of June (see below). His cause was gaining new adherents at the end of the year.

**The Misery of the Impotent.** Fanaticism and violence, in Italy as everywhere, are the inevitable fruits of mass misery and frustration. Economic conditions reduced multitudes to desperation. The Rome headquarters of UNRRA asserted on February 28: "It is not an exaggeration to say that there are thousands upon thousands of people living near the edge of starvation in Italy"—where recent reductions in rations had left the populace with an average of 650 calories daily. While the wealthy sported motor cars and lived well on the black market, the poor starved. By summer prices had risen to a point at which famine seemed inevitable for those in the lower income brackets. On the black market the lira reached a low point of 560 to the dollar by September 6, as compared to the official rate of 222 set early in the year. By mid-November the black market rate was 583 and by early December it had reached 850.

The intolerable hardships of daily life evoked reactions of violence from some of the victims. In early March unemployed farm workers in Andria, near Bari, revolted against the authorities and the landowners. Six were slain by the Carabinieri before "order" was restored. Early July saw riots in Rome, ostensibly in protest against the loss of Trieste. Late in July more rioting broke out in the south, while all oil workers struck and Milan and Turin were gripped by general strikes. Armed workers seized factories to enforce demands for wage increases. On July 19 a 24-hour strike of all printers prevented the publication of all newspapers save the Vatican *L'Osservatore Romano*. In August Sicilian peasants, protesting grain requisitions, engaged the police in battle with numerous casualties. A mob of workers in Rome tried to storm the Ministry of the Interior on October 9, with two killed and 141 wounded. On October 31 a bomb blast wrecked a wing of the British Embassy. Further disorders were in progress in various parts of the country at the end of the year.

That more violence did not occur was attributable to the apathy, rather than to the moderation, of the hungry. Socialist leader Pietro Nenni declared in Leghorn on November 23 that civil war or dictatorship would be the result if the Socialist and Communist parties together did not conquer power in the near future. On December 1 the Right-wing Christian Democrats, led by Count Stefano Jacini, demanded the end of the coalition government and a crusade against the Communist menace. Four days later police authorities announced that the Soviet Union was supporting a secret organization ("Troika") of 280,000 "well-armed extremists," designed to perpetrate acts of terrorism and sabotage. The Cabinet later declared the report false and apologized to Moscow. But with millions jobless and starving or existing on foreign relief, incentives for the discharge of aggressions against public symbols of authority were almost irresistible.

**New Republic.** During the first half of 1946 Italian politics revolved around the fate of the Monarchy. Prince Humbert, "Lieutenant General of the Realm," was reported early in the year to favor a referendum to decide the "institutional" issue. Early in April Count Carlo Sforza, irreconcilable anti-monarchist, declared that "a republic, voted

by an overwhelming majority of my compatriots, can bring prosperity and social order to Italy, while the monarchy, with the terrific burden of its long complicity with Fascism and Nazism, can only follow the path which brought the Bourbon monarchy in Spain to so many disasters." On April 27 the Congress of Premier Alcide de Gasperi's Christian Democratic Party, strongly Catholic but little disposed to follow the Pope in political matters, voted three to one in favor of a republic.

King Victor Emmanuel finally abdicated on May 9 in favor of Humbert and, after a reign of 46 years, sailed away to Egypt. While Rightists and Leftists campaigned violently in preparation for the referendum of June 2, Gasperi remained noncommittal. The voters were asked to express their preferences regarding the structure of the state and to elect deputies to the Constituent Assembly. The balloting of June 2 resulted in 10,717,923 votes for the Monarchy and 12,719,284 votes for a Republic. Humbert hesitated but finally departed for Spain on June 13, after the Cabinet had proclaimed the transfer of his powers to the Premier. "With my soul full of grief, but with the serene consciousness that I have made every effort to comply with my duties, I leave my country," he declared, at the same time accusing the Government of "illegalities" in a statement which the Cabinet described as "a painful document based on falsehoods."

The Republic was officially proclaimed on June 10. On the 28th the Constituent Assembly elected as Provisional President Enrico de Nicola, sixty-eight-year old Neapolitan Liberal. He was supported by the Christian Democrats, Socialists, and Communists, after Vittorio Orlando, originally favored by the Christian Democrats, was opposed by the two Marxist parties and Benedetto Croce, favored by the Left, was vetoed by the Christian Democrats. The task of preparing a republican Constitution was not to be completed until sometime in 1947.

**The Political Scene.** The coalition Cabinet formed by Alcide de Gasperi on November 30, 1945, (see YEAR BOOK for 1945, page 293) continued to hold office throughout the year with various changes of personnel. In municipal elections in March the Left parties scored notable gains, despite Rightist expectations that Italian women (voting for the first time) would choose conservative candidates. In the election of June 2 the various parties elected deputies in the following numbers:

Christian Democrats	207
Socialists	115
Communists	104
National Democratic Union	41
L'Uomo Qualunque	30
Republicans	23
National Bloc of Freedom	16
Action Party	7

One curiosity of the election was the winning of 68,000 popular votes by the "Unionist" party, favoring the admission of Italy as a state to the U.S.A. The Christian Democrats polled almost 8,000,000 votes, the Socialists 4,600,000 and the Communists 4,200,000. Three of the six parties of the erstwhile Committee of National Liberation—i.e. the Liberals, the Labor Democrats, and the Actionists—virtually disappeared. The Republicans made appreciable gains. In Italy, as in France, political power was henceforth to be shared by liberal Catholics, Socialists and Communists.

After much friction and jockeying, leaders of these groups reached an agreement on July 6 for limited wage increases and for raising public rev-

enues through an internal loan, a capital levy, and confiscation of war profits. On July 12 Gasperi formed a new four-party coalition Cabinet:

*Prime Minister, Minister of the Interior and Temporary Foreign Minister*—Dr. Alcide de Gasperi, Christian Democrat.

*Minister Without Portfolio, Deputy Prime Minister and Eventual Foreign Minister*—Pietro Nenni, Socialist.

*Minister Without Portfolio*—Randolfo Pacciardi, Republican.

*Minister of Justice*—Fausto Gullo, Communist.

*Minister of the Treasury*—Prof. Epicarmo Corbino, Independent.

*Minister of Finance*—Mauro Scoccimarro, Communist.

*Minister of War*—Cipriano Facchinetti, Republican.

*Minister of Public Works*—Giuseppe Romita, Socialist.

*Minister of Transport*—Giacomo Ferrari, Communist.

*Minister of Industry and Commerce*—Rodolfo Morandi, Socialist.

*Minister of Foreign Trade*—Pietro Campilli, Christian Democrat.

*Minister of Post-War Assistance*—Emilio Sereni, Communist.

*Minister of Public Instruction*—Guido Gonnella, Christian Democrat.

Despite angry exchanges between the Premier and Communist spokesmen regarding strikes, Soviet influence and the role of the Church, the Cabinet was endorsed by the Assembly on July 25 by a vote of 388 to 53, with *L'Uomo Qualunque*, the monarchists and a number of Sicilian separatists in the opposition. Communist attacks upon Gasperi's foreign policy followed his return from Paris on August 23, but the coalition remained intact. On September 22 Gasperi resigned as Secretary General of the Christian Democrats and was at once elected to the party presidency. Don Luigi Sturzo, seventy-four-year old liberal Catholic, anti-Fascist and founder of the pre-Fascist Populist party, returned to Italy in September after an exile of twenty-two years but assumed no active political role. The Liberal (i.e. conservative) and Democratic (i.e. monarchist) parties coalesced in a Right-wing "Liberal" party in September and wooed Giannini's "Common Man" group.

Gasperi's position was weakened in October by criticisms leveled against him by the Left wing of his own party as the Right wing flirted with extreme conservatives. On October 19 Socialist Pietro Nenni became Foreign Minister in accordance with the agreement of July. A week later the Socialists and Communists concluded a new "unity of action" pact avowedly aimed at the conquest of power by the working class. Both parties scored notable gains in the municipal elections of November, winning joint majorities in Rome, Turin, Genoa, Florence and Naples. In Leghorn the Communists won a clear majority. At the same time "Common Man" candidates emerged first in Palermo, second in Rome and third in Naples, while the Christian Democrats lost ground everywhere. These developments would doubtless have precipitated a Cabinet crisis, since Communists and Christian Democrats were now at sword's points, save that neither party wished to assume responsibility for jeopardizing the success of the reconstruction loan. At year's end the increasingly precarious coalition was still being maintained.

**The Papacy in Politics.** In view of the ideological and institutional preferences of the Vatican, the trends of Italian politics throughout the year were deplored by the Holy See. At the beginning of Lent, Pope Pius XII denied the right of the State to bar priests from advising parishioners in political matters. At Easter he urged the Catholic Action Youth to fight as never before against "anti-Christian" forces in public life. On May 12 he told 40,000 young women at St. Peter's that it was their "sacred duty" to vote only for parties pledged to

"respect the rights of God and of religion." He also warned against "State absolutism" and "wreckers of Christian civilization." The defeat of the monarchy and the successes of the Marxist parties were serious rebuffs to Papal hopes.

Under the Concordat of 1929 the Vatican was pledged not to interfere in internal Italian politics. Numerous acts and utterances regarded by critics as violation of this promise provoked a wave of anti-clericalism throughout the country in the autumn. Crowds demonstrated in Rome in favor of divorce laws, hitherto unknown in Italy. The anti-clerical weekly, *Don Basilio*, gained a growing audience, despite Papal excommunication of its editors and publishers, who declared that they went out "with head held high from the community in which Mussolini and Hitler were considered worthy men." In mid-December the Vatican journal, *L'Osservatore Romano* asserted that the various anti-clerical papers, some of which had become increasingly abusive, were inciting to violence against priests. On December 23 a court in Rome sentenced Ruggero Maccari, editor of *Don Basilio*, to two years in prison for having slandered the clergy and "offended the religion of the State." He appealed the decision. Mounting bitterness in the relations between Left leaders and the Catholic hierarchy threatened new conflicts during 1947.

**Peace Treaty.** The prolonged process of treaty-drafting, with Italy not a "co-belligerent" participant but a victim of bargaining among the Super-Powers, brought no comfort to Italians of any political view. A telegram of January 15 to the U.N. General Assembly expressing hope that Italy might soon join the "international community" brought no response save acknowledgment and publication in the Assembly's Journal. While expressing willingness to cede the Dodecanese Islands to Greece, Gasperi pleaded for Italian retention of Trieste and the African colonies.

On May 15 the Foreign Ministers accepted an American proposal for a modified armistice which replaced the Allied Control Commission by a supervisory commission, limited to military affairs, and restored Italian sovereignty in all non-military fields. During discussions of this change of status, rumors circulated regarding "secret annexes" to the new terms whereby the U.S.S.R., in return for alleged Anglo-American assurances of acquiescence in Soviet hegemony in Rumania and Bulgaria, was said to have agreed to British control of Italian trade and commerce. The Communist organ, *L'Unita*, charged on June 16 that London had submitted a proposed "military agreement" by which Italy would virtually become a British protectorate. These stories were not substantiated. But it was clear that London and Washington would have a major voice in Italy's fate if they were prepared to compromise their differences with Moscow in other areas.

During the spring, as the Council of Foreign Ministers hammered out a draft treaty, Italian politicians and patriots of diverse orientations voiced their hopes and pleas that the new Republic would not be stripped of Trieste and the colonies. As for the Adriatic port city, which was Italian as to its urban population and Yugoslav as to its hinterland, the insistence of Moscow on its annexation by Yugoslavia and the determination of London and Washington that it should remain Italian produced a deadlock. On June 29 Foreign Minister Bidault of France first proposed the final solution: an autonomous territory of Trieste, administered by the Big Four plus Italy and Yugoslavia. Gasperi vainly suggested a plebiscite.

**Vae Victis.** The draft of July 26, consisting of 78 articles and 9 annexes (text in *New York Times*, July 27, 1946) contemplated acceptance of the "French Line" as the Italian-Yugoslav frontier north of Trieste and internationalization of the port and its environs. It also provided for the cession of the Dodecanese to Greece, of several Adriatic islands to Yugoslavia, and of small border areas near Briga, Tenda, Mt. Thabor, Mt. Cenis and the Little St. Bernard Pass to France. Libya, Eritrea and Somaliland were to be surrendered, but their status would not be determined for a year, during which time they would be administered by the occupant (Great Britain). Reparations of \$100,000,000, payable over seven years, were provided for the U.S.S.R., with other reparations to be fixed later. The Italian Army was to be limited to a maximum of 250,000 men and 200 tanks; the Air Force to 25,000 men, 200 fighter and reconnaissance planes and 150 transport and liaison planes; and the Navy to 2 battleships, 4 cruisers, 4 destroyers, 16 torpedo boats, 20 corvettes and 22-500 men, with other units to be turned over to the Big Four.

Resentment and despair swept over Italy with the announcement of these terms. Premier Gasperi arrived in Paris on August 7 and on the 10th delivered a moving address to the Peace Conference pleading for modifications. A series of memoranda supported his appeal. The net result, however, was negligible. On October 23 the Christian Democratic deputies decided to reject the treaty. Only the Communists supported ratification, with the Socialists divided and other parties opposed. In early November Palmiro Togliatti, Communist leader, went to Belgrade and returned with a proposal from Tito that Italy retain Trieste and cede Gorizia to Yugoslavia instead. This possibility of a bilateral settlement attracted lively interest, but came to nothing after a month of discussion. The New York meeting of the Council of Foreign Ministers substantially confirmed the terms already agreed upon and provided that the treaty (which would go into effect on ratification by the Big Four, regardless of Italian acceptance or rejection) should be signed in February, 1947. The details of the final version had not been revealed by the end of 1946.

**Relations with the U.S.** American policy during the complex negotiations of the peace settlement brought only slight comfort to Italian patriots. The original American plan for a U.N. trusteeship over all the Italian colonies was abandoned in favor of postponement of the whole issue. In mid-February an accord was signed between the Italian Air Ministry and Transcontinental and Western Air Lines (U.S.) by which a joint Italian-American company would control a network of 14 civil airlines covering all Italy. British resentment was registered at this American encroachment upon what was regarded as a British market. The State Department declined to aid TWA. Completion of the arrangements depended upon the final peace settlement.

On July 12 President Truman named James C. Dunn, Assistant Secretary of State, as Ambassador to Italy to succeed Alexander C. Kirk. The United States vigorously opposed any reparations settlement which would eventuate in American aid to Italy being funneled off to other lands. On September 9 a contract was signed in Rome for the purchase by the Italian government for \$165,000,000 of surplus civilian property of the United States Army, valued at \$565,000,000. The terms contemplated payment spread over 20 years, beginning in January, 1951. On October 12 Byrnes

announced that the United States would transfer \$50,000,000 to the Italian Government at once as reimbursement for lira furnished U.S. forces in Italy. Premier Gasperi, who declared in August that Italy would face starvation in 1947 without foreign credits of \$880,000,000, prepared at the end of December to come to Washington to seek a loan. He indicated that his country would need \$4 billion during the next four years.

The dusk, like the dawn, of the year 1946 in Italy was dark with fears for the future, with riots by the unemployed and hungry, and with gloom, dissension and doubt. American largess might relieve immediate needs. It would also provoke Leftist accusations of exploitation and enslavement. In international, as in interpersonal relations, gratitude is displayed only by givers to takers, never by takers to givers and still less by debtors to creditors. Years of want, suffering and toil would inevitably elapse before the Italian Republic could hope for a life of freedom and plenty for its people.

FREDERICK L. SCHUMAN.

**JALUIT.** The chief island (169° 42' E. and 5° 48' N.) in the Marshall group of the Japanese Pacific Islands (which see). Area, 8 square miles. Civil population (1938), 10,546 (10,038 natives and 504 Japanese). Copra was the principal export. The island has been under the control of United States armed forces since the defeat of Japan in 1945.

On November 6, 1946, the United States requested that the island be placed under United Nations trusteeship with the United States as administering authority.

**JAMES FOUNDATION OF NEW YORK, INC.,** was incorporated August 23, 1941, under the Membership Corporation Law of the State of New York, pursuant to the provisions of the will of the late Arthur Curtiss James who died on June 4, 1941. The Foundation will receive, upon the conclusion of the executorial administration of the estate of Arthur Curtiss James, the residuary estate, the amount of which is not yet determined. The income of the funds received, and ultimately the principal of the funds, will be distributed through organized religious, educational, and other charitable corporations. President: William W. Carman. Trustees: William W. Carman, Robert E. Coulson, Williamson Pell, and John K. Olyphant, Jr. Office: 39 East 69th Street, New York 21, New York.

**JAN MAYEN.** An arctic island between Greenland and northern Norway, 220 miles north-northeast of Iceland. Area, 144 square miles. It is mountainous, Mt. Beerenberg in the north being 8,350 feet high. A meteorological station was established on the island by Norwegians in 1921. The island was formally annexed by Norway on February 27, 1930.

**JAPAN.** A country of Far Eastern Asia, comprising four main islands (Hokkaido, Honshu, Kyushu, and Shikoku) and a number of smaller islands. Japan and her overseas possessions and conquests passed under the control of Allied armed forces following the surrender of Japan in 1945. Territories which Japan relinquished included Formosa, Japanese Pacific Islands, Korea, Kuriles, Kwantung, Manchukuo, and the southern half of Sakhalin (Karafuto). Emperor of Japan: Hirohito (ascended the throne, Dec. 25, 1926).

**Area and Population.** Japan proper had an area of 143,667 square miles. The census of April 26, 1946

showed a population of 73,110,995, with 34,903,285 males and 38,207,730 females. Chief cities (1946 census): Tokyo (capital), 3,442,106; Osaka, 1,293,501; Nagoya, 719,382; Yokohama, 706,557; Kobe, 443,344; Fukuoka, 288,794; Sendai, 255,036; Yokosuka, 249,702; Sapporo, 227,323; Kawasaki, 210,157.

**Events, 1946.** The intricately complex problem of establishing Japan as a peaceful nation and building it into a structure that would occupy its proper place in a world of nations fell mostly to the United States. Japan saw the edifice of her old life, built on the practices of hundreds of years, crumble before the decisions and decrees of General Douglas A. MacArthur, Supreme Commander for the Allied Powers (SCAP), and found herself in 1946 trying to grope a way through the rubble that once composed the old world of nationalism, imperialism, feudal economy, industrial monopoly, and state religion.

On the first day of the year, Emperor Hirohito delivered an Imperial Rescript containing a profound religious and political transformation for the Japanese people. In a document unparalleled in Japanese history, the Emperor told his people that his divinity is a "false conception" based on ancient myths and legends that are without validity in fact and that the corollary Shinto doctrine that "the Japanese people are superior to other races and fated to rule the world" is equally misconceived. Parts of the Rescript were devoted to two pledges: first, he reaffirmed the charter of the Emperor Meiji, establishing free assembly, forming government according to public opinion, and providing justice and equity for the common people as well as the governing class; second, he established a human relationship (and identified himself with the people) by saying "we stand by the people and we wish always to share with them their moments of joy and sorrow." From his subjects the Emperor asked for unity and work. "If the nation is firmly united in its resolve to face the present ordeal and seek civilization constantly in peace," the Rescript read, "a bright future will undoubtedly be ours."

The precursor to the Emperor's voluntary abdication of divinity was delivered two weeks earlier by General MacArthur who ordered the disestablishment of the Shinto religion. Teaching Emperor divinity and racial superiority, Shintoism was used as the medium to rationalize conquest and imperialism. The MacArthur decree removed government-financed support from Shintoism, forbade the teaching of the religion in schools, forbade the use of any religion to teach the notion of Emperor divinity, and placed Shintoism on the level with other religions as a sect.

During the first four months of the occupation at the end of 1945, war criminals had, for the most part, been limited to top members of the military and political figures in the highest executive positions. Behind this relatively small clique, however, were broader groups of the people who actively supported the Japanese war effort as members of the principal wartime totalitarian organizations. These were the influential government officials, the political speakers and writers, the members of terrorist or secret patriotic societies and the major and minor heads of the Imperial Rule Assistance Association and the Imperial Rule Political Society. In anticipation of the forthcoming general elections in April, General MacArthur ordered the Japanese Government on January 4 to perform two wide reforms; one, dissolve permanently twenty-seven military and political movements identified with the Japanese military expansions and submit a list

of the officers of such organizations back to the China Incident of July, 1937; and two, remove summarily and exclude from public office and government service all persons who were officers of these organizations. Included in these categories, "not entitled to a hearing on other procedures precedent to removal," were all army and navy officers and enlisted men, civilian employees, military police of the notorious *Kempeitai*, and officials and higher employees of twenty companies that financed the colonization and development of Japanese-occupied territories.

The impact of the two directives was felt through all strata of the Japanese Government. The Ministry of Premier Baron Kijuro Shidehara narrowly avoided collapse as five members, included in the scope of the purge, resigned. Rather than precipitate another crisis and become the fourth cabinet to dissolve, the Shidehara Cabinet decided to reform and remain in office, pending the general elections. In the lower administrative structure of the Government, nearly half of the prefectural governors and bureau heads were forced to resign. After several members of the Imperial Household were affected by the decrees, the liberals of Japan were given a measure of justice in the appointment of Dr. Tatsukichi Minobe to the Japanese Imperial Privy Council, the highest consultative body to the Emperor. Minobe, recognized as Japan's foremost constitutional scholar, was driven out of academic life in disgrace as an arch-enemy of the military caste's totalitarian ideology in 1934.

The job of screening candidates and determining the eligibles for public office under the MacArthur directives was retained in the hands of the Shidehara Government. By February 10 the effect of the purge was chaotic; the Shidehara Government gave the directives sweeping interpretations and disqualified nine-tenths of the Imperial Diet from holding office. In early March the purge spread to intellectuals who condoned or propagandized Japan's expansionist policies.

After tearing down the nationalistic political fabric of Japan, General MacArthur turned to a phase of national law and on February 19 placed Japan under a regime of "extraterritoriality," which removed nationals of the United Nations from the jurisdiction of the Japanese courts and the Japanese police, and placed them under the authority of the Allied powers. This move recalled the era before 1899 when Japan was emerging from her strict isolationism and her laws did not conform to the traditions and uses of Occidental jurisprudence. After the 1899 Japanese victory over China, she attained full sovereignty by a vigorous campaign against extraterritoriality and the adoption of a legal code based on European models.

General MacArthur's efforts to mould a new Japanese nation by removing the centuries-old imperialistic, autocratic, and feudalistic system were crystallized in the draft of a new constitution, presented to the public on March 6 by the Shidehara Government with the full approval of the Supreme Allied Commander. The new constitution, framed after close consultation with Allied military authorities and officially endorsed by the Emperor in an imperial rescript, was to be submitted to the new Diet after the April elections.

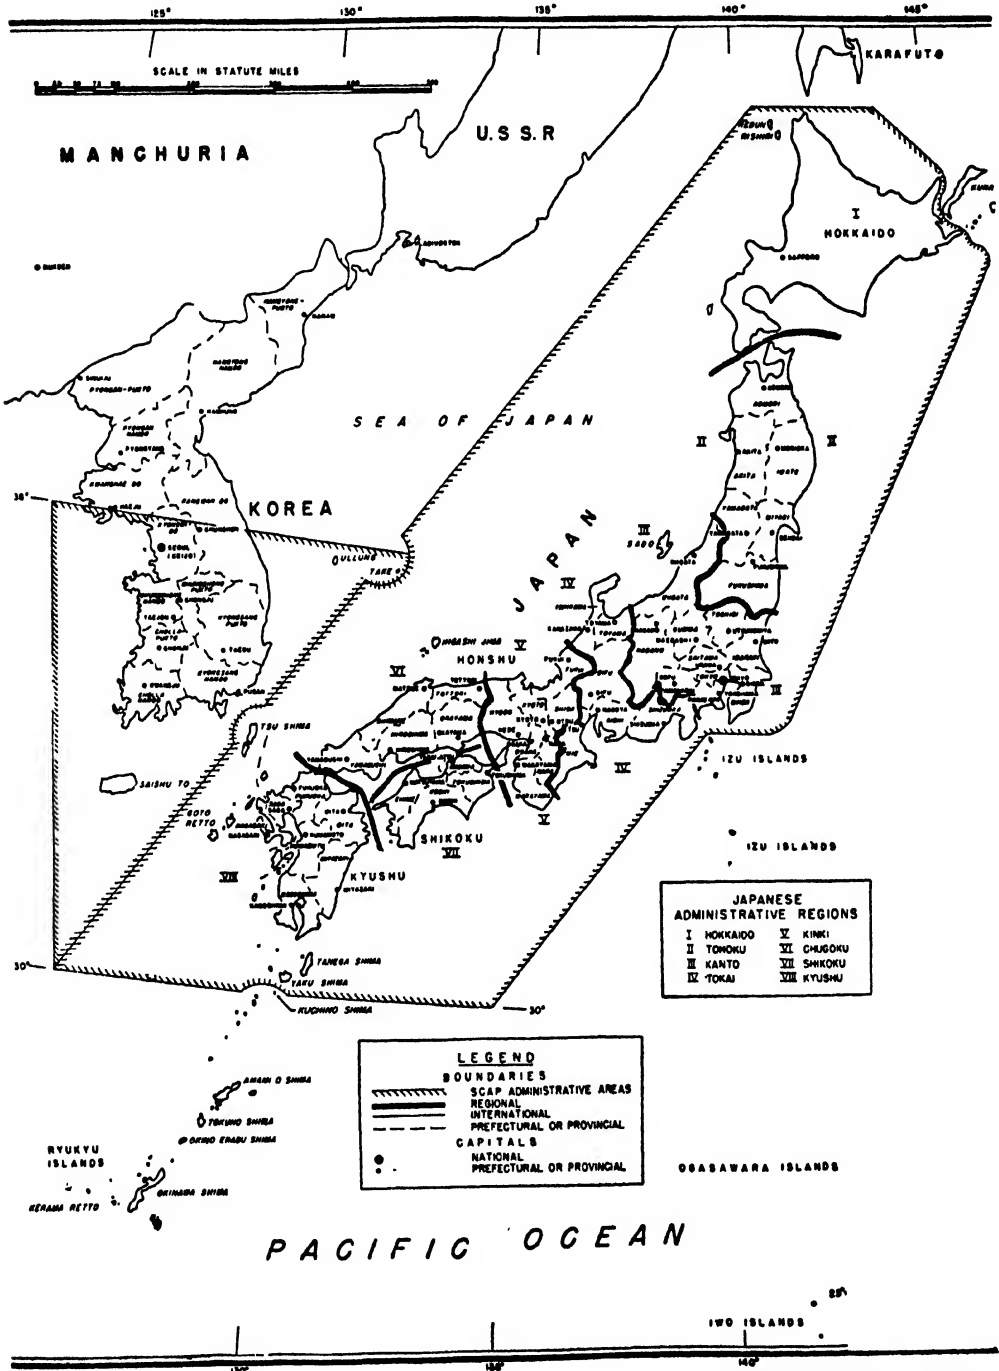

The proposed constitution, virtually a bloodless revolution in itself, replaced the Emperor Meiji constitution handed down in 1899. The two outstanding clauses of the constitution embodied a renunciation of war and stripped the Emperor of all sovereign rights and governmental power.

"War, as the sovereign right of the nation, and the threat or use of force, is forever renounced as a means of dealing with other nations. The maintenance of land, sea, and air forces, as well as other war potential, will never be authorized. The right of belligerency of state will never be recognized."

"The Emperor shall be the symbol of the state and of the unity of the people, deriving his position

from the sovereign will of the people." As regards the Emperor's old power to legislate, the Constitution read, "this Constitution shall be the supreme law of the state and no imperial rescript contrary to the provisions thereof shall have legal force or validity."

"The advice and approval of the Cabinet shall be required for all acts of the Emperor in matters of state and \* \* \* be responsible therefor."

To reinforce its renunciation of war, the preamble declared, "We have determined to rely for our security and survival upon the justice and good faith of the peace-loving peoples of the world. We desire to occupy an honored place in an international society designed and dedicated to the preservation of peace."

With many innovations borrowed from the United States, Great Britain, and France, the constitution created a parliamentary regime in which the Diet was the highest organ of state power and the sole "law-making authority." The abolition of state Shinto was legalized and the State was forbidden to engage in religious activities, thus further removing the State divinity concept. Another vestige of the old system was dropped in the abolition of the oligarchical House of Peers, which was replaced by a House of Councillors, subordinate to the lower house and elected by the people. The judicial system was revamped and provided with a powerful Supreme Court, vested with the "whole judicial power," and appointed by the cabinet rather than by the executive branch as in the United States system.

The Constitution established a revolutionary "Bill of Rights," based on the United States model, which instituted public freedoms unique in Japanese history and contrary to traditional Oriental concepts of family behavior. Included in the provisions were equal rights for husband and wife and marriage by mutual consent of both sexes, the abolition of involuntary servitude, freedom of thought and conscience, the prohibition of cruel punishment, the use of search and arrest warrants, speedy trials, and the right of the individual not to be required to testify against himself.

Reaction to the constitution was generally favorable in Japan with the leading political parties—Liberal, Progressive, Cooperative—favoring the draft. The Socialist party refrained from comment, while the Communist party objected to the fact that the draft had been drawn up by the Shidehara cabinet "which made a desperate effort to preserve the sovereignty of the Emperor. . . . and the Tenno system." The *New York Times* felt that the constitution struck a too Utopian note when it declared that Japan will rely for her security "upon the good faith of the peace-loving peoples of the world." Additional criticism considered the constitution rather premature and contended that a constitution should be the product of many years experience in the field of self-government.

Japan approached the April 10 general election with little friction. On April 1 General MacArthur declined the suggestions of the Far Eastern Commission that the projected elections be delayed on the grounds that the war-mongering, reactionary element of Japanese politics had not been fully disorganized and completely banned from public office. He stated that the Diet still contained a Tojo taint and that it was necessary to elect a more representative body. The New Zealand and Soviet Union members of the Council, questioning the advisability of immediate elections, felt that the newly-arrived moderates would have little chance against the firmly entrenched old-line parties. Furthermore, the serious transformation occurring in Japan's economic structure made it difficult, they pointed out, to obtain an authoritative and intelligent expression of the desires of the Japanese people on their political future.

In Japan's freest election, in which the voting age was reduced from 25 to 21 and women were enfranchised for the first time in Japan's history, the Rightists won a comfortable victory. The lead-

ing parties involved in the election were the Progressives, the most conservative, led by Shidehara, who accepted the party's helm just before election; the Liberals, another strongly conservative faction, led by Ichiro Hatoyama, a member of the Diet and former Minister of Education; the Social Democrats, weakly moderate groups, whose ranks were split by dissenting cliques; and the Communists, the smallest of the large party group, who actively campaigned against Shidehara.

The results of the election showed that an estimated 26,000,000 voters passed control of the first postwar Japanese Parliament into the hand of the conservatives.

The election returns failed to give any party a majority, the Right wing dominated the 466-seat Parliament with the Liberals capturing 140 seats, the Progressives 93, the Social Democrats 92, the Cooperatives 14, the Communists 5, independent candidates 82, and various smaller parties 38, while two seats remained vacant because no candidate polled a minimum total. One third of the votes were cast by women. Thirty-eight women of a total 80 candidates won seats. At the end of the 90th Session of the Diet on October 12, the alignment was: Liberals 148, Progressives 110, Social Democrats 96, Cooperative Democrats 45, New Peoples 35, Independents 23, Communists 6.

With no party controlling a clear majority in the new Diet, Baron Kijuro Shidehara announced his intention to remain Premier until the draft of the constitution was ratified. The move immediately met the opposition of Liberals and Socialists, who refused to cooperate with the Shidehara regime, and as opposition grew, Baron Shidehara and his cabinet resigned en bloc on April 22. With the Shidehara resignation, Ichiro Hatoyama, president of the Liberal party, came to the fore as the leading candidate for Premier. The Soviet members of the Allied Council protested the likelihood of Hatoyama's premiership because of his early-war admiration for Hitler and Mussolini and his active support of the Japanese war effort. When it grew increasingly obvious that Hatoyama would succeed to the premiership, General MacArthur on May 3 banned him from taking a seat on the Imperial Diet, under the purge directive of January 4. During the turmoil that followed, Tetsuo Katoyama, Socialist leader and former organizer of the Farmers' Union in prewar Japan, was requested to form a coalition Cabinet, but was unable to surmount the obstacle of Liberal and Progressive opposition. Finally, the situation was resolved on May 15 when Shigeru Yoshida, the Foreign Minister and former Ambassador to London, accepted the leadership of the Liberal party. After receiving instructions on the next day from the Emperor to form a cabinet, Yoshida drew up an essentially conservative ministry, consisting of the following:

*Premier and Foreign Minister*, Shigeru Yoshida, Liberal; *Home Minister*, Seija Omura, Non-partisan; *Finance*, Tanzan Ishibashi, Liberal; *Justice*, Tokutaru Kumura, Non-partisan; *Education*, Kotaro Tanaka, Non-partisan; *Welfare*, Yoshinari Kawai, Non-partisan; *Agriculture*, Hiroo Wada, Non-partisan; *Commerce*, Jiro Hoshijima, Liberal; *Transport*, Tsunejiro Hiratsuka, Liberal.

Ministers Kimura and Wada replaced the initial selection of Chuzo Iwata and Shiroshi Nasu, respectively, who were unacceptable to Allied headquarters.

Until December 1945 the occupation of Japan was exclusively an American affair with General MacArthur acting as the supreme authority over the Japanese people. In the face of the demands

of other nations for a voice in the occupation of Japan, the Big Three conference at Moscow modified the powers of the Supreme Commander and created two new organizations, the Far Eastern Commission and the Allied Council. Neither of these bodies, however, infringed upon the "sole executive authority," General MacArthur, thus insuring the United States of its pre-eminent position in Japanese affairs. The Far Eastern Commission, composed of eleven members, with the United States, Russia, China, and Great Britain holding veto power, was created to formulate policy for the Allied government of Japan, while the Allied Four Power Council, made up of the veto-power nations of the Far Eastern Commission, was created to supervise execution of the policy.

After its organization in Tokyo on April 5, disagreement within the Council arose in mid-April as to its authority in relation to General MacArthur's executive powers. General MacArthur emphasized his position in a notice to the Council that he considered the Council's function purely advisory. Furthermore, he refused two Soviet requests for copies of all occupation orders since the time of the surrender and submission of future directives for Council inspection seven days prior to their publication. The Council had no authority over matters prior to its formation, General MacArthur stated, and as to the latter request, the Council would be given 48-hour notice of directives, because a longer period would create a prejudicial time lag in occupation duties. On April 21 General MacArthur appointed George Acheson, Jr., of the United States Department of State, chairman of the Allied Council.

In response to the MacArthur 48-hour edict, Lt. Gen. Kuzma Derevyanko, Soviet member of the Council, declared on May 15 that the Supreme Commander failed to carry out the terms of the Moscow Conference. Mr. Acheson replied that the council's duties were merely consultative and that any change in the system constituted unjustifiable interference. Later in May General MacArthur apparently changed his attitude toward the Council and sought their advice on three pressing problems; land reform, disposition of government property and organized labor. Indication was made by Mr. Acheson that General MacArthur would refer numerous other matters to the Council. By June 6 the Council agenda included the additional items of the extension of Japanese fishing grounds, the operation of the merchant marine and the dissolution of the Japanese Lumber Company.

The long-standing questions of Japanese reparations divided the Allies; the United States fostered the attitude that democratization of Japan would be seriously jeopardized if the people were deprived of economic hope, while Australia, New Zealand, China, and the U.S.S.R. claimed the need for immediate payment of Japan's reparation bill, especially in the form of textile machinery and other equipment to rebuild their own war-disrupted peacetime industries. On May 13 Edwin W. Pauley, President Truman's reparations representative, said that textile machinery would not be included in reparations payment and the Far Eastern Commission thereupon drew up interim reparation policies, limiting reparation claims to army and navy arsenals, the aircraft industries, and the light metal industries, with the exception of special purpose machinery and equipment essential to Japan's peacetime economy. Earlier in the year General MacArthur took control of 394 Japanese aircraft plants, army and navy arsenals, and war laboratories for possible reparation payments.

Mr. Pauley reiterated the United States reparations policy on May 11, declaring that strenuous resistance would be made to efforts by any ally to obtain as reparations the manufacturing plants needed by Japan to produce exports for the payment of food. Specific sources of reparations were labelled by General MacArthur in a sweeping directive in August that set aside 505 of Japan's largest and most modern plants in eight basic industrial branches as potential material. Together with the previous directive naming war plants as possible sources of reparations, the decrees placed approximately one-third of Japan's industries open to seizure.

If the Allies were to take the earmarked plants when the final reparations bill was submitted, Japan's key heavy industries would be reduced nine-tenths. At their wartime peak, the industries set aside by the directives produced 95 percent of Japan's pig iron, 88 percent of the steel ingots, 50 percent of the machine tools, 87 percent of the shipbuilding facilities and 90 percent of the ball and roller bearings. Most of the plants were taken from the Zaibatsu holdings, factories owned by large family concentrations of wealth which were denounced by the Allies as "feudalistic and abettors of war."

The most critical problem in the minds of most Japanese during the first half of 1946 was the severe shortage of food. A combination of bad conditions—poor weather, crop hoarding by farmers who were reluctant to sell food for inflated currency, a large flow of food into the black market and a collapse of price controls—forced the Japanese Government to maintain a wartime ration of 1,300 calories daily.

In January the occupation authorities realized that a famine might very well occur unless food was imported by May. General MacArthur estimated that Japan had to import 3,311,000 tons of food in 1946 to provide an 1,800-calorie daily minimum diet. The situation was made further alarming by the revelation that Korea, which normally exported between 36,000,000 and 54,000,000 bushels of rice to Japan annually, would almost certainly be able to ship nothing.

The existence of large pools of food in the black market and in the rural areas began at the outset of the occupation. The Government found its methods of food collection ineffectual and the distribution of food from farms to cities was small in proportion to the volume of produce. S.C.A.P. viewed the predicament as an exclusively Government affair and refused to use occupation troops to supervise food collections. By March 1, the Government had collected only 52 percent of the rice quotas from farmers as against 86 percent for the year before.

The original 1946 import requirement was revised to 2,000,000 tons by General MacArthur in a report to the War Department in which he stated that Japan needed 200,000 tons of wheat, rice, soy beans, and other foods each month until fall. In March the Combined Food Board in Washington approved of only 600,000 tons and the Far Eastern Commission ruled in April that only sufficient food should be sent to Japan to safeguard the Allied occupation forces.

The early summer months saw the food shortage at its worst, with nine people a day dying from starvation in the Tokyo area. By fall the most critical period had passed and bumper crops of rice and sweet potatoes were anticipated. Allied headquarters strove to prevent starvation and arrest by releasing 157,435 metric tons of imported ce-

reals and 17,273 tons of canned food, totaling about 25 percent of the monthly staple food ration. In September the Government promised the people their first ration of rice at controlled prices since May.

A great part of the fabric of Japan's prewar economy was woven around a feudalistic, tenant-farmer system of agriculture. The average farm was less than two and a half acres with over two-thirds of the farmers renting at least a part of the land they tilled. Since 1930, when Japan's economy was geared to the war machine, farmers seldom made a profit. The very nature of the farmers' poverty furnished food and incentive to the war machine; the low standard of living provided funds for armaments, his children filled factories with cheap labor, and his abject life gave foundation to the propaganda for expansion and *lebensraum*.

After S.C.A.P. recommended that the land-holding system be reformed, the Japanese Diet passed an agrarian reform law in December, 1945, limiting the land held by absentee landlords to about twelve acres and providing for the sale of the remainder of the land at fixed prices through local land commissions. Objection was made to payment to landowners by the Soviet Council member, Lt. Gen. Derevyanko, who preferred to expropriate the land. Mr. Atcheson, the United States representative, rejected expropriation because it was not in "accord with democratic principles."

Because of numerous loopholes, the Diet revised the bill and presented a new program in late August for breaking up the feudal land holdings. The purpose of the bill was to prevent absentee landlordism and cut the roots from the system that forced the family of a tenant farmer into the cheap labor pools of the urban communities. If the provisions were carried out, tenants would be sold four-fifths of the land under cultivation on a 30-year pay basis. The 3,000,000 share-cropper families would become owners of 5,000,000 of the 6,500,000 acres held under tenancy. The land would be purchased by the Government from the owners at 757 yen per tan (about one fifth of an acre). Superficially the bill contained the defect of not limiting the amount of land one family could own nor setting any limit on the amount of land that could be purchased. Also, landowners attempted to evade the law by illegally selling portions of land to members of their immediate family and other relations.

The role of labor, long a dormant, ineffective force in the shaping of national policies, rose to prominence after the surrender of Japan. After the initial organizing activities, which were essentially limited to individual factories, federations rapidly began to form. In Hokkaido thirty-three coal mines were federated by January and plans were made for a national union. Similarly, unions began forming among the tramway workers, railroad workers, and government employees. By July 4,000 labor unions and 3,000,000 members were organized.

The growing importance of labor persuaded the Government to establish a new Ministry of Labor with full Cabinet status in May to cope with the increasing problems that accompanied labor's rapid growth. The most prominent problem stemmed, not only from the right to strike, but from the workers' power to expropriate a factory, workshop, or office from an employer. This power, usually known as the sit-down strike, stimulated a Cabinet debate over possible legislation to curb "the workers' control of production." Most members of the conservative Cabinet felt that this workers' privilege was undesirable and would retard production.

A major strike, breaking out in the offices of the newspaper *Yomiuri Hochi* on June 14, developed into a battle to determine whether capital or labor would control the Japanese press. The strike was set off by the dismissal of Tomin Suzuki, managing editor and vice-president of the Japan Press and News Agency Workers Union, two days after 700 workers had been refused a salary increase. In a conflict over control of the newspapers policies, Suzuki lost to the editor, Tsunego Baba, on the decision of the board of directors. The strength of the strike gradually diminished after Baba agreed to pay the increases, but refused to permit the union any voice in the editorial policies. Although S.C.A.P. remained impartial in the dispute, it was generally felt that the publishers were favored against the union, some of whose leaders had strong leftist leanings. General MacArthur had made it known repeatedly that he would definitely oppose any Communist trends in Japanese politics.

Japan's 80,000 maritime workers went on strike on September 10 in protest against the mass dismissals that it believed imminent after the Government had announced that it would reduce the number of maritime workers by 80 percent. The strike came after the Government made no reply to the union's demands for retraction of the unilateral lay-off policy, negotiation with the union over personnel reorganization and Government retraining of workers forced into other industries by the lay-off. The strike was settled on September 20 with the Government granting wage increases of 30 to 50 percent, plus living allowances.

A week after the maritime strike began the Government narrowly averted a threatened 24-hour walkout by the 500,000 government railway workers who objected to the projected dismissal of 75,000 workers. The Government conceded to the formation of a joint management council on which labor would supposedly have an equal voice in determining personnel adjustments.

The lower house of Parliament passed a controversial labor bill on September 15 which established machinery for the arbitration of industrial disputes but prohibited strikes by government employees and municipal workers. Workers in certain occupations, including transportation and public utilities, were prohibited from striking until thirty days after the employer or employee had applied for mediation.

Allied success in transforming the Japanese economic structure proceeded more slowly than the political and social reforms. The foundation of prewar Japan's monopolistic economy was primarily based on the *Zaibatsu*, the dozen or so families that ruled Japan's economic life. This economic oligarchy was one of the strongest supporters of the military machine for which it provided the weapons and munitions of war.

Immediately after the occupation was installed, General MacArthur informed the *Zaibatsu* that their dissolution was necessary to Japan's postwar democratized economy. In April, S.C.A.P. accepted the plan of the Yasuda family for the entire *Zaibatsu*. Under its terms, the families would sell their holdings in all companies to a Liquidation Commission in exchange for government bonds not negotiable for at least ten years.

According to a report by Corwin D. Edwards, the U.S. State Department's consultant on cartels, the *Zaibatsu* combine controlled 51 percent of Japan's coal production, 88 percent of the steam-engine production, 55 percent of the pulp production, 69 percent of aluminum production, and 51 percent of the airplane-manufacturing industry.

The Edwards recommendations, if followed, would mean a revolution for Japan's industrial economy and its relation to world trade. The Zai-batsu's system of trusts and cartels had been ramified by price fixings and market allocations. The State Department report urged a long range conversion of Japanese industry to the American way of doing business. To aid in the conversion, need was stressed for an anti-trust law, oriental versions of the Securities and Exchange Commission and the Federal Trade Commission, and new tax laws.

The dissolution of the five largest members of the Zaiatsu with the transfer of their operating and subsidiary shares to the Liquidation Commission was scheduled for Sept. 30. The family trusts affected by this initial trust-busting move were;

Mitsui—Including ninety-one corporations with an aggregate capital of 3,880,000,000 yen.

Mitsubishi—Thirty-eight corporations with a capital of 2,767,000,000 yen.

Sumitomo—Thirty-one corporations with a capital of 1,666,000,000 yen.

Yasuda—Twenty-nine corporations, with a capital of 641,000,000 yen.

Fuji Industrial (formerly Nakajima, making war materials, including aircraft)—sixty-six corporations, with a capital of 281,000,000 yen.

The capital of these 255 companies represented about half the aggregate capital of 1,200 concerns designated for liquidation by Allied headquarters.

Japan's attempts to survive the destruction of the war and rehabilitate her peacetime industries and trade so that her population could be sustained by exports of finished products to pay for food proved a difficult task. Before the war exports were based on the products of the cartel-slave labor combination. Furthermore Japan had developed strong markets within her empire, which supplied her with the necessary raw materials. A unique feature of Japan's imperialistic growth was the development of Manchuria into an industrial center for the benefit of the homeland. Usually, world empire development was characterized by a siphoning of raw materials from the colony to the homeland, which finished the raw materials into goods and products for sale to the colonies. Japan somewhat reversed the procedure and made the homeland the market for goods produced in the colony.

Stripped of her prewar colonies, Japan's dependence on foreign countries for food and raw materials grew into a significant problem. In January the occupation authorities realized that the re-establishment of textile industries was an important factor in breaking the inflation and affording Japan an opportunity to pay for an important factor in breaking the inflation and affording Japan an opportunity to pay for imported food. Accordingly, approval was made for shipments of 340,000 tons of cotton to Japan. Before the war, Japan was the world's largest exporter of cotton textiles. Despite the shortage of labor, by the end of May Japan attained one-fifth of its prewar cotton textile capacity and one-third of its prewar rayon capacity.

Japan had provided 75 percent of the prewar world's exportable silk, and for a time silk accounted for one-third of the export trade, with some 25 percent of the population deriving at least a part of their income from the product. In 1946, Allied plans called for the shipping of 120,000 bales to the United States at the controlled rate of 10,000 to 14,000 bales monthly. Exports were arranged on the prewar averages of 80 percent for the United States and 20 percent for the rest of the world. By August 53,000 bales had been shipped and 32,000 more were awaiting shipment

to the United States. Allied headquarters anticipated a permanent world market for Japanese silk of 200,000 to 225,000 bales, about half the prewar export total.

General MacArthur's plan for the revival of Japanese trade was approved by the War Department in March. With the exception of silk and rayon goods, the plan intended the bulk of Japan's exports to be directed to the Orient, particularly to China, Formosa, and the Netherlands East Indies. The predominant purpose of the plan was to reduce Japanese unemployment and provide Japan with the means to purchase food with exports. A tentative schedule of exports for 1946 included the following partial list:

	First Half Year	Second Half Year
Cotton fabrics including towels and blankets (square yards)	None	88,500,000
Raw silk (bales)	30,000	50,000
Assorted silk fabrics (square yards)	40,000,000	38,000,000
Silk and rayon mixed fabrics (square yards)	10,000,000	7,000,000
Rayon fabrics (sq. yards)	25,000,000	55,000,000
Hosiery (dozen pairs)	94,000	1,000,000
Electric light bulbs	None	5,000,000
Electric refrigerators	600	1,400
Phonographs	10,000	30,000
Bicycles	50,000	100,000
Household radios	20,000	30,000
Radio tubes	1,000,000	15,000,000
Aquatic products including dried sharks' fins (tons)	450	350

In preparation for this program S.C.A.P. created a non-profit committee to organize the converting of 2,000,000,000 tons of armaments steel for civilian use.

The revival of production and trade was strongly hinged on Japan's ability to produce coal. The detrimental effects of the acute food shortage and run-down condition of the mines limited the coal output up to September to 1,500,000 tons monthly against 3,000,000 tons before the war. Joseph Z. Reday, chief of the industrial division of Allied headquarters, said that the number of miners, 300,000, was about the same as before the war, but much time was lost in strikes and absences from the mines to seek food.

Emperor Hirohito gave impetus to ratification of the new constitution in an address to the Diet on June 21, urging approval of the constitution in the name of "the supreme will of the people." In the debate that followed the only major revisions concerned the status of the Emperor and the Cabinet. In the preamble, amendment was made to read "We do proclaim that sovereignty rests in the people." Further subordination of the Emperor was made in Chapter I, Article 1, in which declaration was made that the Emperor "derives his position from sovereign will of the people, in whom sovereignty rests."

The second major change concerned Article 64, amended to make it necessary that the Premier and a majority of the Cabinet be members of the Diet.

On August 24 the draft of the new constitution was adopted by a vote of 421 to 8 in the lower house of the Diet and on October 7 it was formally approved by a standing vote without debate.

Adherence to General MacArthur's January 4 purge decree took on new vigor on July 29 when Premier Yoshida indicated before the lower house of the Diet that stricter enforcement of the purge direction would be undertaken. Unofficial estimate claimed that 15,000 Japanese lost their jobs in public office as supporters of the war regime.

A few weeks later Premier Yoshida, in a speech following his formal installation as President of the

Liberal Party, lauded Ichiro Hatoyama, first president of the party, as well as "other members of the party, who have been purged." Late in September after the Government outlined a plan for the purge of intellectuals and business men, Chuza Iwata, former Minister of Justice, was banned from the House of Peers and forbidden to hold any public office.

The problem of democratizing Japan often flared into a communism versus democracy issue in Allied Council meetings. General MacArthur and Mr. Atcheson openly attacked Communist propaganda and labor union infiltration, asserting that the United States strongly disapproved of any leftist domination of Japan's economic and political life.

A poll taken by the influential newspaper *Asahi* in August revealed a progressive trend away from the conservative Government and the many mild liberals that filled the lower house of the Diet. Of those questioned in the poll, 40 percent supported the Socialist platform against 33.7 percent behind the Liberal-Progressive combination in the Government. The swing to the left derived from the Government's inability to cope with inflation and the food shortage. It was further believed that if the Government wiped out the large capital holdings, as the Allied wished, the only way Japan could maintain an important industrial establishment and an export surplus was through Government ownership.

A month later General MacArthur declared that the "dread uncertainty" of an ideological struggle between democracy and communism hung over Japan. The statement was made in a summary of the first year of occupation. Speaking directly against leftist indoctrination by representatives of the Soviet Union, MacArthur warned: "The Japanese, long regimented under a philosophy of the extreme conservative Right, might prove easy prey to those seeking to impose a doctrine leading again to regimentation under the philosophy of the extreme radical Left." He asserted that the benefits of democracy would form the cornerstone of Japan's freedom, "unless uprooted and suppressed by the inroads of some conflicting ideology which might negate individual freedom, destroy individual initiative and mock individual dignity." In actuality, the Communist party was a minor influence; they had seated five members in the Diet, their party membership did not exceed 10,000, their leadership was inexperienced, and their influence in the powerful Congress of Industrial Unions was on the wane.

The Social Democratic Party, the third largest in Japan, polled 10,000,000 votes in the national election. Although its platform was distinctly left at the time of election, it displayed an increasing tendency to a more conservative program. The anti-Communist sentiments of the Allied authorities reflected themselves in the development of the Social Democratic policies. In the Diet, the Social Democrats excluded members of the Communist Party when trying to form a united Front. Suetiro Nishio, vice-president of labor's right wing Sodomei Federation, was re-elected to the party's all important post of Secretary General. In determination of future policy, the left wing, which held about 27 of the 90 seats in the Diet, was voted down in its desire to oust the Yoshida Government. The re-elected party president, Tatsuo Katoyama, maintained the party platform of socialism, but added that the Social Democratic Party will "take neither a right nor a left course."

Under the guidance of General MacArthur, the

Japanese Diet continued to tear down the hallowed traditions and procedures and substitute them with more Occidental institutions and innovations. The Yoshida Government on July 19 introduced proposals for the revision of two basic laws, long a part of Japan's governmental pattern. Predicated on the bicameral legislative system provided in the new Constitution, the first proposal established a new elective Upper House, replacing the now old hereditary nobility and Imperial nominees who constituted the House of Peers. The new body, known as the "House of Councillors" would act as "an organ of restraint on the House of Representatives." The second proposal, effecting the Imperial Household Law, established a procedure for succession to the throne. It barred women from succeeding to the throne, and left room for inclusion of possible provisions for succession if the Emperor abdicated the throne.

During the following month the Government's provisional legislative commission attacked part of the fundamental roots of Japanese life and outlined laws designed to eliminate the custom of primogeniture and place women on an equal economic basis with their husbands. The new laws would supersede the existing laws which granted the "head" of each house the legal right to make decisions regarding all members of his family. The ancient custom of leaving the complete inheritance of a family to the oldest son was discarded and replaced by laws providing that obligatory shares would go to the widow and all children. The law providing for economic equality of the wife would abolish the existing law whereby the husband had the use and administration of all property belonging to his wife, who could not take any action without his consent or consent of the "head" of the house.

On September 20 the Diet approved the Labor Relations Adjustment Act prohibiting strikes against the Government, and enacted a series of laws intended to democratize provincial and local administration. The labor law, passed when a strike among the railway workers threatened, demanded that Government workers give thirty days' notice of any intention to strike and provided for compulsory arbitration during the interim. The four administration laws, effective in October, provided for the popular election of prefectural governors, mayors of cities, and chiefs of villages, townships and wards. The laws eliminated any control over such officials by the national Government, which previously had made appointments.

Included among other bills passed by the time the Diet adjourned on October 12 were laws governing the budget, capital levies, indemnity cancellation, and finance rehabilitation. The largest Governmental appropriation in Japanese peacetime history was adopted in an ordinary budget of 65,800,000,000 yen, plus two extraordinary budgets which brought the total up to 122,490,000,000 yen. A large source of Government revenue was expected from a law imposing a capital tax of 25 to 90 percent on fortunes above 100,000 yen (\$6,600 at the official exchange rate). An estimated 43,000,000,000 yen from 500,000 taxpayers was anticipated from this levy. The reduction of the Government debt by 100,000,000,000 yen was expected from the law that cancelled all indemnity guaranteeing restitution to Japanese industry for damage incurred by enemy action. Also approved was a law establishing a 10,000,000,000 yen Government fund to finance the recovery of light industry necessary to manufacture products for reconstruction.

Labor difficulties constantly intervened as Japan tried to rehabilitate her disrupted economy. The disparity between prices and wages, irritated by inflation and black market activities, resulted in an endless succession of strikes. On October 5 the Government threatened to take over all radio stations if the employees continued to participate in the radio and newspaper strike that began September 22. The end of this strike, on October 24, was a major blow to organized Japanese labor. Despite failure of the union to reach an agreement with radio management, the workers decided to return to work, in a move that was interpreted to indicate disunity in union ranks.

General MacArthur's headquarters decided to curb labor unrest on August 29 and informed the Government that "strikes, walkouts, or other work stoppage which are inimical to the objectives of the military occupation are prohibited." With the announcement of this measure, General MacArthur ordered the authorities to end the three-day-old seamen's strike that stopped the sailing from Sasebo of five ships bearing repatriated Japanese. As the Congress of Industrial Organizations called a strike affecting 53,000 miners in the Hokkaido coal fields on October 10, Premier Yoshida denounced the wave of strikes as a political maneuver by the left to oust his regime. All units of the Japanese Congress of Industrial Organizations were on strike or presenting demands during September.

After a five-day walkout, the Hokkaido miners won a victory by obtaining a 30 percent wage increase. By the end of November the Government indicated a stronger policy toward strikes would be adopted. Welfare Minister Kawai, speaking before the House of Peers, said that while the Government supported a healthy union movement, strikes backed by a political motive or even strikes with economic aims but in conflict with public interest, would be actively opposed.

Linked to Japan's efforts for renovation of her industry to comply with peacetime economic needs were the conditions surrounding the reparations demands of the Allied powers on Japan. According to an official announcement by the United States Department of State the final reparations program would aim to strip Japan of all war-making power. While terms of the final demands on Japan were under frequent discussion in the meetings of the Far Eastern Commission, General MacArthur's headquarters claimed that delay in presenting the terms was seriously impeding the work of the occupation. The deadlock on reparations resulted from an issue on the status of machinery and equipment removed from Manchuria by the Soviet Union. The United States wished to have the removals deducted from the Soviet reparations bill while the Soviet Union considered the Manchurian removals legitimate war booty.

The deadlock prompted the United States on November 7 to invite ten nations, including the Soviet Union, for assistance in preparing a directive on how to divide reparations from Japan. The proposal was extended to all members of the Far Eastern Commission, which included, in addition to the United States and the Soviet Union, Britain, France, China, the Netherlands, Canada, Australia, India, New Zealand, and the Philippine Republic. The United States suggested that the Commission draw up interim orders for the immediate division among the claimant countries of from 15 to 20 percent of the Japanese assets selected for reparations and later determination of how the remaining 80 percent should be allotted.

On November 28 publication was made of the

first detailed reparations report, prepared by Edwin W. Pauley, U.S. Reparations Commissioner, which blueprinted plans for smashing Japan's war-making potential and recommended removal from Japan of about three-fourths of her key iron, steel, and machine-tool industries. With the elimination of all war and munitions industries, the report suggested complete removal of all aluminum, magnesium, and synthetic oil plants and 50 percent removal of electric powers facilities.

The iron and steel industries, termed "a powerful weapon for the domination of Asia," would be reduced to an annual capacity of 2,750,000 tons—less than 2 percent of the amount annually produced in the United States. The cut in iron and steel industries would permit the Allies to divide among themselves approximately 6,000,000 tons of open hearth capacity, 3,000,000 tons of electric furnace facilities and machinery capable of rolling 6,000,000 tons of iron and steel.

Characterizing the machine-tool industry as the heart of the problem of reducing Japan's war potential, Mr. Pauley said that a total of 600,000 machine tools should be removed from Japan's heavy stocks, leaving 175,000 which would include the capacity to produce no more than 10,000 new machine tools annually.

In the field of shipping, the report proposed that Japan be limited to 1,500,000 gross tons with no vessels exceeding a weight of 5,000 gross tons or a speed of twelve knots. On this basis the Allies would receive 114 ships, each weighing 5,000 tons or more, totaling 869,000 tons.

Other major categories of the Pauley report include: nitric acid—240,000 tons annually for reparations, leaving Japan an annual capacity of 12,500 tons; celluloid production—completely removed; railway equipment and rolling stock—removal of 970 electric and steam locomotives and 30,000 freight cars with seizure of plants with a capacity to make 850 locomotives, 1,200 passenger cars and 7,600 freight cars; shipbuilding and ship repair facilities—seizure of 30 to 40 shipyards, leaving Japan 548 shipyards for wooden ship construction; petroleum—seizure of all synthetic oil plants except portions of five used for production of nitrogenous fertilizers; communications equipment—manufacturing capacity limited to home needs; power plants and facilities—removal of 140 thermal power plants totaling 2,000,000 kilowatts and an undetermined number of 1,507 hydroelectric installations; ferro alloy minerals—removal of all nickel smelters and mining and milling equipment from "uneconomic" mines for chromium, manganese, tungsten, molybdenum, and nickel.

The Japanese compliance with General MacArthur's purge directive aroused a charge from the Soviet Allied Council member, Lieut. General Derevyanko, on October 2 that the Japanese Government was preserving the structure of its military general staffs through the use of former high-ranking military officers on demobilization board. Directing his accusations at the Japanese, the Soviet representative said that the personnel of a former military intelligence division was operating behind the veil of the demobilization agency and was engaged in activities which bore little relation to the primary job of demobilizing the Japanese army and navy.

The critical food shortage which was at its lowest point during the summer months apparently eased off by the end of October when the Government raised the rice ration to its prewar level of two-and-a-half "go," about two-and-a-half handfuls. While the Government announced that Japan

was not yet self-supporting, the increased ration was afforded by the arrangements permitting the importation of 2,000,000 tons of staple foods. In an effort to raise agricultural productivity, the Government devised a system of long-term loans to assist purchasers of land previously uncultivated. Chiefly intended for repatriates and the unemployed, the plan provided for a 10,000 yen (\$660) loan to each landowner for the purchase of equipment, livestock and fertilizers.

The new constitution was officially promulgated on November 3 in an Imperial Rescript read over the radio by Emperor Hirohito. In his most important address since the New Year's message destroying the divinity concept as myth, the Emperor announced the organic law that proclaimed the sovereignty of the people and the renunciation of a Japanese armed force.

The ninety-first Diet ended its month-long extraordinary session on December 26 after enacting legislation which included a new Imperial house law assuring the regal status of Imperial family and rejecting the concepts of female succession to the throne or abdication by the Emperor. Other laws set up the bicameral Diet as the supreme power and abandoned the hereditary House of Peers for a popularly-elected House of Councillors.

On December 21 Japan suffered one of the greatest earthquakes and tidal wave disasters in its history. Six tidal waves swept over southern Japan causing nearly 2,500 casualties, including 1,088 dead and wrecking the homes of a 100,000 people on the island of Honshu, Shikoken and Kyushu. The damage listed by the Tokyo Ministry on December 24 included 7,350 houses wrecked, 9,555 partly wrecked, 2,742 washed away, 2,899 buried under debris, 2,502 vessels wrecked, 48 bridges damaged, 91 levees wrecked, and 155 roads damaged.

**Repatriation.** The repatriation of Japanese nationals and members of the armed forces, in compliance with the provisions of the Potsdam Declaration and in answer to the growing demands of Japanese families on the homeland, began effectively in 1946. The United States Army and Navy jointly explained their plans on March 1 for the evacuation of 3,300,000 Japanese from China, Manchuria, and Formosa by using American ships, primarily manned by Japanese crews. Up to the date of the announcement about 239,000 Japanese troops and 128,000 civilians had been transported from China and Manchuria, leaving 1,700,000 troops and 1,600,000 civilians in those areas and Formosa.

In the Soviet Union zone, the United Press reported that between 100,000 and 200,000 Japanese troops had been shifted from the Mukden, Manchuria, area in February to work in the industrial center of Chita in Siberia. Questioning Soviet repatriation policies, Mr. Acheson opened the issue in an Allied Council meeting in June by citing the report that repatriation from United States-controlled areas was 93 percent complete, from the British-controlled areas 68 percent complete, from the Chinese areas 94 percent complete, and from the Soviet areas no repatriation had been made. Lt. Gen. Derevyanko claimed that repatriation fell outside the purview of the Allied Council, but Mr. Acheson quoted the Potsdam Declaration which said: "Japanese military forces, after being completely disarmed, shall be permitted to return to their homes with the opportunity to lead peaceful and productive lives."

After repeated pleas by Japanese government officials and direct representations by Washington,

the Soviet Government announced on September 28 that between 17,000 and 25,000 Japanese would be shipped monthly to Japan.

By September 1 Allied headquarters announced the repatriation of 4,402,357 Japanese. The largest units of the Japanese merchant fleet were mobilized on November 27 to repatriate the first large group of Japanese soldiers and civilians in Soviet-held territory. The twelve repatriation ships were expected to carry some 25,000 Japanese citizens from northern Korea, Siberia, Manchuria and Sakhalin. On December 19 the Soviet Union agreed to repatriate Japanese at the rate of 50,000 a month, which doubled the Soviet Union's initial repatriation rate and included civilians as well as prisoners.

**Changes in Education and News.** Allied Headquarters dug at the roots of the Japanese war mentality on the last day of 1945 by suspending the teaching of history, geography and morals by Japanese schools and ordering the destruction of textbooks and teachers' manuals. The three subjects by which the Japanese military clique indoctrinated school children would be substituted by current events programs tied to radio news periods.

Until the Japanese Education Ministry could prepare new textbooks or pamphlets, Allied authorities intended to use the radio as primary education medium. To assist in the textbook revisions, thirty prominent American educators were invited to Japan by General MacArthur. It was hoped that the mission would succeed in revamping Japan's entire educational system, from elementary schools to universities, to facilitate the occupation force's program of re-education.

The Japanese press in early January was instructed not to speculate on the policies of the Allied powers, particularly in regard to the possible arrest of war criminals. The order came to light after the Allied censors refused the Japanese press to print an Associated Press dispatch reporting the Allies' intention to arrest additional "Class A" war criminal suspects, accused of promoting Japanese militarism. At the same time the Allies moved to "weed out all second cousins holding broadcasting jobs" and establish Japanese broadcasting as a responsible duty. Immediately after the occupation, the Allies took over the hundred-odd broadcasting stations, retained most of the staffs, and dictated broadcasts or suggested types of programs.

Resumption of the teaching of history in Japanese schools with the employment of new "objective textbooks" was authorized on October 14. General MacArthur's headquarters announced that the new books were free of "militarism, ultranationalism and the doctrine of Shinto which characterized the wartime texts." Japan's defeat in the Pacific was discussed in the texts which characterized the occupation as the beginning of a democratic Japan. The teaching of geography was resumed on June 29, but instruction in morals continued to be outlawed.

During the first year of the occupation, the effect of the purge on the teaching profession showed 331 dismissals out of a total of 15,992 teachers examined.

**Financial Status.** Entering the initial phase of the postwar period, Japan found its financial structure undermined by a serious inflation, black market activities and a production output hampered by reparations, reconversion and wage scale fluctuations. At the beginning of the year circulation was twenty-seven times greater than the prewar normal. The value of the yen stood at one-tenth of a cent on the basis of the black market rice price

and six and two-thirds cents, at the official rate. Since the flow of produce was so sporadic, the value of the yen could not be realistically pegged on the basis of staple food supply. In January current prices of perishable foods were about twenty times what they were in the prewar and early wartime days.

The vicious financial system that existed forced the Japanese Government to supply the demands of the occupation army by producing more government obligations and selling them to the banks, thus producing additional currency which the banks sent into circulation. In an effort to break this program before the currency grew completely out of hand, Allied Headquarters ordered the Japanese Government on January 24 to cease paying occupation costs through deficit financing or supplying the Allied requirements by printing additional currency. This forbade the use of overdrafts on the Bank of Japan which hitherto had been honored by simply printing currency. The order also froze the Government's debts to the banks and insisted that the bonds be retired as quickly as possible, with a prohibition on further borrowing. The order was prompted by a Government application to borrow 14,000,000,000 yen from the Bank of Japan, in exchange for Government bonds, so that the deficit of November and December 1945 expenses could be met.

The greatly increased quantity of yen in circulation was accomplished by a 300 percent increase in retail prices between February 1945 and February 1946. The constantly rising spiral of inflation was prodded by a nation-wide black market that resulted from the inability of supply to meet demand. The immediate causes resulted from the destruction of factories and other means of production during the war, the disrupted communications system, a shortage of labor and the volume of yen that had increased from 18,000,000,000 to 62,000,000,000. To combat this cancerous bankruptcy, the Japanese Government, with the approval of Allied Headquarters, froze all bank accounts on February 16 and set up a plan for recalling all circulating currency and making a limited issue of new currency. Between February 25 and March 2 the Japanese were ordered to turn in all currency over five yen denomination and receive new money.

In addition, the Government clamped a ceiling on salaries with a limit of \$33 a month during this "exchange" period. Individuals were limited to bank withdrawals of 300 yen (\$20) a month for each head of a family, plus 100 yen for each member of a family. This last measure was aimed to reduce the amount of yen in circulation and in the hands of the consumer, thus stalemating black market activities.

Despite the reduction of circulating currency from 62,000,000,000,000 to 15,000,000,000,000 yen, the new laws failed. Businessmen, who were limited to salaries of 500 yen, were hired as "advisors" by other companies and received a 500 yen salary from each company. Families gave false registrations to obtain additional yen or contrived deals with American occupation troops who were not restricted in the amount of old yen they were allowed to convert. Of greater importance in the failure of the plan was the lack of an accompanying program for the increase of consumer goods to eliminate consumer competition at the black market.

During the period March 2–November 7 the volume of currency in circulation rose from 15,000,000,000 to 70,000,000,000 yen, a figure that

was thirty-five times the normal prewar level. With production less than 2 percent of the prewar level, Finance Minister Ishibashi said that Japan's answer to the inflation problem was not in attacking inflation itself, but rather to increase production.

**Production.** Economic rehabilitation proceeded gradually throughout the year, with primary concentration placed on restoring production of essential consumer goods, but with some attention given to production of certain export items. Production of the six major food crops for 1945 were (in metric tons): rice 6,200,000; barley 500,000; naked barley 700,000; wheat 900,000; sweet potatoes 4,800,000; potatoes 2,200,000. These crops normally account for over 80 percent of the caloric value in the Japanese diet. Tea production in 1944 equaled 47,000 metric tons and 25,000 metric tons for 1945. Vegetable production in 1945 equaled 5,500,000 metric tons; estimated 1946 production was 6,000,000 metric tons. Livestock totals for 1945 and estimates for 1946 were: cattle 2,318,000 and 2,993,600; sheep 181,760, no estimate for 1946; goats 257,700 and 252,700; horses 1,254,044 and 128,600; hogs 250,000 and 200,000. Electric power capacity for 1945 was: hydro-electric 6,161,000 kilowatts; steam 3,964,000 kilowatts.

**Foreign Trade.** First half 1946 (January through June). Exports: main items and country to which exported:

<i>China</i>	
Detonators, electric	546,000 pieces
Eggs, silkworm	300,000 sheets
Seedlings, mulberry	2,000,000 pieces
Timbers, moving	18,218,800 boardfeet
<i>Hong Kong</i> Coal	87,943 metric tons
<i>U.S.S.R.</i> Eggs, silkworm	50,400 sheets
<i>United States</i>	
Lead	5,000 metric tons
Rubber	1,900 long tons
Silk, raw	42,513 bale/case
Tin	2,205 short tons
<i>Korea</i>	
Bamboo	20,788 bundles
Boiler tubes	10,897 pounds
Cloth, wool & cotton	900,000 yards
Coal	389,558 metric tons
Paper, cigarette	265,634 pounds
Seed, vegetable	72,200 pounds
Seedlings, mulberry	910,000 pieces

*Imports (main items) and countries of origin*

<i>China</i>	
Phosphate rock	7,350 metric tons
Salt	117,690 metric tons
<i>United States</i>	
Foodstuffs	178,217 short tons
Vegetable seeds	58,353 pounds
Cotton, raw	65,311 bales
Phosphate rock	12,502 short tons
Medical supplies	1,400,000 pounds
Oil, fuel	385,125 barrels

**Transportation.** The rail system sustained relative slight war damage but suffered from inadequate maintenance and over-taxing of facilities. Gradual progress was made in improving operations through progress in repair and construction of rolling stock, improvement of track bed and improved labor conditions. The number of motor vehicles in operation as of August 31 equaled 104,000 as compared with 74,000 in September 1945. The merchant shipping fleet at the time of surrender was reduced to one-third its prewar strength.

JOSEPH P. BLANK.

HIROSHIMA AND NAGASAKI

[Because of its historical importance the following accounts of the bombing of Hiroshima and Nagasaki are included in this year's YEAR BOOK, since the first complete official information has be-

come available only during 1946. These accounts were prepared, by the Personnel Narratives Division of AAF Headquarters, from the June 30, 1946, report of the Chairman's Office of "The United States Strategic Bombing Survey" established originally on November 3, 1944, by the Secretary of War to study the effects of our aerial attack on Germany, and, on August 15, 1945, requested by President Truman to conduct a similar study of the effects of all types of air attack in the war against Japan, submitting reports in duplicate to the Secretary of War and the Secretary of the Navy. The Survey, operating from headquarters in Tokyo early in September, 1945, with sub-headquarters in Nagoya, Osaka, Hiroshima, and Nagasaki, with mobile teams operating in other parts of Japan, the islands of the Pacific and the Asiatic mainland, provided for a complement of 300 civilians, 350 officers, and 500 enlisted men. The officers of the Survey during its Japanese phase were: Franklin D'Olier, Chairman; Paul H. Nitze, Henry C. Alexander, Vice Chairmen; Walter Wilds, Secretary; Harry L. Bowman, J. K. Galbraith, Rensis Likert, Frank A. McNamee, Fred Searls, Jr., Monroe Spaght, Dr. Louis R. Thompson, Theodore P. Wright, Directors.]

**Atomic Bombs.** The overpowering devastation of atomic power was first demonstrated in actual battle on August 6, 1945, when the Japanese city of Hiroshima felt the full force of an atom bomb dropped from the sky. Three days later, Nagasaki, another important city in the Japanese industrial war machine, was blasted by an atom bomb. The cumulative effect of these two devastating actions partially contributed to the surrender of Japan on August 14, 1945—eight days later.

The effects of the bomb on these cities, the contrast in damage, and an account of the nature and history of each city provide meaning for the details of the disorganization and damage experienced by each of them.

**Target: Hiroshima.** At exactly 8:15 a.m. (Japanese time) on August 6, a bombardier opened the bomb-bay doors of the U.S. Army Air Forces B-29 Superfortress *Enola Gay* and unloosed a bomb on the city below.

There was a blinding flash in the sky several hundred feet above the center of the city, instantly followed by a surge of intense heat felt four to five miles from the ground zero (a point on the ground directly under the air blast). Within two minutes the entire area of Hiroshima was covered with a dense, black cloud, resembling boiling dust, that climbed to 40,000 feet.

Thus was the world introduced to military atomic power in the form of a bomb which had the explosive power of 20,000 tons of TNT. The missile which leveled Hiroshima exploded slightly northwest of the center of the city, approximately 750 feet southeast of the point where the Motoyasu Gawa River branches from the Ota Gawa River.

Statistics reveal that this one atom bomb on that August day destroyed 4.7 square miles of Hiroshima, with the dead numbered at between 70,000 and 80,000 people and a similar number injured—a mortality rate of 15,000 per square mile and a casualty rate of 32,000 per square mile.

Hiroshima was selected for the first battle use of the atomic bomb because of its concentration of activities and population. It was a choice military target because in it was located the headquarters of the Second Army and the Chugoku Regional Army Headquarters, which occupied the greater part of the central island. Here, too, both residential areas and military barracks overlapped and surrounded

the central island. It was also the site of one of the largest Japanese military supply depots, and was the foremost military shipping point for both troops and supplies. However, by August 6, its shipping had been brought to a virtual standstill because of sinkings in and the mining of the Inland Sea.

Hiroshima is located on the broad, fan-shaped delta of the Ota River, whose seven mouths divide the city into six islands, which were connected by eighty-one important bridges. Because of its location and construction, Hiroshima was a prime target, uniformly exposed to explosive blast effect. The only protection was afforded by a kidney-shaped hill, which offered some blast protection to structures on the eastern side opposite the point of fall of the bomb. The hill is about a half mile long, with an elevation of 221 feet. Otherwise, the city was highly vulnerable to the bomb's spreading energy.

The boundary of Hiroshima extends to some low hills situated to the west and northwest. Its area embraces 26.36 square miles, of which only 13 square miles were built up on August 6. Most of Hiroshima's industrial plants were located around the city's perimeter, either to the east or on the southern ends of the islands. The airport was also located on the south central island formed by the Ota Gawa and the Motoyasu Gawa.

The heart of the city, before the explosion, consisted of four square miles of highly concentrated area—a combination of residential, commercial and military establishments containing three-fifths of Hiroshima's population. Five evacuation programs had been completed prior to August 6, and a sixth was underway. Evacuations had reduced the city from its wartime peak of 380,000 inhabitants to 245,000.

Before World War II, Hiroshima was Japan's seventh city in size of population. But although it was the principal administrative and commercial center of the southwestern part of Honshu Island, from an industrial standpoint it was relatively unimportant, ranking twelfth. The advent of war, however, brought new plants which helped increase its significance.

Judged strictly as a testing ground for the atom bomb, Hiroshima was a tinder box. All its dwellings were built of wood, half of which were one story high and the rest either one and a half or two stories. Most of the roofs were constructed of hard-burnt, black tile. According to Japanese custom, large groups of buildings were clustered together. Lacking any masonry division walls and with an outmoded, inadequate fire fighting force, the dwellings were ideal for conflagration, even in peace time. This description of dwellings and residential buildings in Hiroshima almost matched Nagasaki—target of the second bomb.

By American standards, Japanese industrial building construction was considered inferior. Even in reinforced concrete frame buildings there was a lack of uniformity in either design or materials. Construction details were generally poor and much of the concrete weak. This condition explains why some of Hiroshima's concrete buildings collapsed from blast pressure alone, after the atomic burst.

But other buildings in Hiroshima were constructed according to a standard far in excess of American practice. Construction regulations in Japan since 1923 (the year of the disastrous earthquake) specify that roofs must safely carry a minimum load of 70 pounds per square foot. American requirements specify 40 pounds per square foot. With these building facts to consider, it may be more easily understood how practically the entire

densely or moderately built-up portion of the city was leveled by the bomb blast and then swept by fire.

Hiroshima had suffered scarcely any damage from air raids throughout the war, although there had been many air alert warnings. During early daylight hours of August 6, it had an air raid alert but the "All Clear" signal was sounded at 7:30 a.m. Most of the industrial workers were either at or en route to their places of employment. There were also some industrial workers and nearly all of the school children engaged on a program, out in the open, to provide firebreaks and remove valuables to safety in the country.

The *Enola Gay* flew in over Hiroshima at an altitude of 25,000 to 30,000 feet to drop the bomb. It was piloted by Colonel Paul W. Tibbets, Jr., of Miami, Florida, with Major Thomas W. Ferrebee, Mocksville, North Carolina, the bombardier. Present in the plane was the man who designed the bomb, Navy Captain William S. Parsons, of Chicago, Illinois.

The weather was clear and sunny. After the bomb was dropped, the *Enola Gay* sped away, and by the time the bomb exploded the plane had traveled eight miles. The flash as well as the smoke of the bomb were seen at a point 160 miles from Hiroshima by crewmen of another Superfort over Wakayama Prefecture. The smoke cloud hung over the city for at least four hours after the explosion.

**Hiroshima Damage.** An infrequent phenomenon, called a "fire storm," occurred in the city. Fires, springing up almost simultaneously over the wide, flat area around the center of Hiroshima, drew in air from all directions. The rush of air easily overcame the natural ground wind, which had a velocity of about only five miles per hour. The "fire wind" attained a maximum velocity of 30 to 40 miles per hour, two or three hours after the explosion. The "fire wind" and the symmetry of the built-up center of the city gave a roughly circular shape to the 4.7 square miles which were almost completely burned out.

The impact of the bomb shattered the routine fabric of community life, disrupting the organizations necessary for handling the disaster. A mass flight from the city took place, with incredulous inhabitants looking for food and shelter. The unprecedented casualty rate may be attributed to the element of surprise, the collapse of many buildings, pinning victims under the structures, and the conflagration that followed almost immediately.

The magnitude of Hiroshima casualties may be judged by comparing the bombing with that meted out in the famous Tokyo fire raid of March 9-10, 1945, in which, although nearly 16 square miles were destroyed, the number killed was no larger than the number killed at Hiroshima and fewer people were injured.

Most of the immediate casualties at Hiroshima died from causes not unlike those resulting from incendiary or high-explosive raids. The outstanding difference was the presence of radiation effects, which became unmistakable about a week after the atomic bombing. At the time of the impact the principal causes of death were: (1) flash burns, (2) secondary effects of the blast and falling debris, (3) burns from blazing buildings. The Hiroshima Prefectural Health Department placed the figures at 60 percent for flash burns, 30 percent for falling debris, and 10 percent for others, and it is generally agreed that burns caused at least 50 percent of the initial casualties.

The explosion started hundreds of fires almost simultaneously, the most distant of which was found

13,700 feet from ground zero. Charred telephone poles were discernible for 10,000 feet south and 13,000 feet north of ground zero. Japanese survivors reported feeling the intense heat on their skins as far away as 24,000 feet.

The official Japanese figures on building destruction listed 62,000 out of a total of 90,000 buildings in the urban area destroyed, or 69 percent. An additional 6,000 buildings (6.6 percent) were severely damaged. Nearly all the rest showed either roof tile damage or shattered glass or both.

All utilities and transportation services were disrupted for varying lengths of time. The water supply system suffered 70,000 breaks in pipe connections caused by blast and fire effects, but the reservoir, located about two miles from ground zero and constructed of earth-covered concrete, was undamaged.

Railroad rolling stock, trolley cars and buses received considerable damage, while the electrical power transmission and distribution system was wrecked. The telephone system sustained 80 percent damage and the city was without service for nine days.

Hiroshima's medical facilities and their chaotic disruption more thoroughly illustrate the terrible difficulties that faced authorities. Out of more than 200 doctors in the city when the bomb exploded, 90 percent were casualties; 30 days later only 30 physicians were able to perform their duties. Of the 1,780 nurses in Hiroshima, 1,654 were either killed or injured. There were 45 civilian hospitals on August 6, but shortly after 8:15 a.m. only three were usable. Two large army hospitals were rendered useless; the casualty rate of patients confined in these destroyed hospitals was practically 100 percent. An undisclosed number of Hiroshima's people died, therefore, for lack of medical treatment. Yet, despite the absence of sanitary measures, there was no report of an epidemic outbreak, a surprising fact in view of the almost total lack of medical facilities, supplies, and personnel and the almost complete disruption of the sanitary system.

Fire-fighting and rescue units were almost bereft of equipment and men and only 16 pieces of fire-fighting equipment were available for fighting the fire, three of them borrowed.

Hiroshima's larger industrial plants were not too badly stricken, even though industry in the city's center was effectively wiped out. The bulk of its output came from the larger plants located on the city's outskirts; the Japanese Steel Company and the Toyo Industries, Inc., in the southeast section, for example, were distantly situated from the bomb zero. Only one of the large companies suffered more than superficial damage. And because they were also safely away from bomb zero in the larger plants 94 percent of the employees were uninjured.

On August 7, Hiroshima's prefectural governor issued a proclamation calling for "a rehabilitation of the stricken city and an aroused fighting spirit to exterminate the devilish Americans." But with Japan's surrender, Hiroshima's reconstruction tapered off. On August 16, regular rationing was resumed. By November 1, 1945, the population of Hiroshima was 137,000. Complete rebuilding of the city was necessary, especially of the main administrative and commercial and residential section, where only 50 buildings, all of reinforced concrete, remained standing.

**Target: Nagasaki.** The second atom bomb which wreaked havoc on a Japanese city was not intended primarily for that city, but for another target. Had it not been for bad weather, thousands of Japanese in Nagasaki, a city of 252,630 in the northwestern

island of Kyushu, might not have been killed or wounded.

A busy seaport, Nagasaki is located on the best natural harbor of western Kyushu. It had, prior to August 9, 1945, undergone five mild air raids during the previous 12 months. An aggregate of 343 tons of bombs had been dropped by 136 planes, total destruction amounting to 276 residential buildings, and 21 industrial plants. Therefore, on August 9, the second atom bomb target was considered intact, when compared with other Japanese cities.

Nagasaki was a highly congested city, extending for several miles along the narrow shores and up the valleys that open out from the harbor. Two rivers, the Nakashima (flowing from the northeast) and the Urakami (flowing into a harbor from a north-northwest direction), are divided by a mountain spur and form the two main valleys in whose basins the city nestles. The mountain spur, plus the irregular topography of the city, effectively reduced the blast effect and the destruction area of the bomb. The metropolitan area of Nagasaki consisted, officially, of approximately 35 square miles and stretched far into the outskirts, while the heavily built-up area was less than four square miles, with a maximum population density of 65,000 per square mile, notwithstanding the previous evacuations. Nagasaki's commercial importance had diminished in recent years because of its isolated peninsular position, inadequate roads and railroad facilities. But its four largest companies (Mitsubishi Shipyards, Electrical Equipment Works, Arms Plant, and Steel Works) employed almost 90 percent of the city's labor aggregate.

Nagasaki had had a raid alert at 7:50 a.m., but it was canceled at 8:30 a.m. When the *Great Artiste*, with a crew consisting of Major Charles W. Sweeney, North Quincy, Massachusetts, pilot; Captain Kermit K. Beahan, Houston, Texas, bombardier; Captain James F. Van Pelt, Jr., Oak Hill, West Virginia, navigator, was sighted, the raid signal wasn't sounded immediately. The raid signal was given seven minutes after the bomb was dropped, with only about 400 people in the tunnel shelters which were adequate for about 30 percent of the city's population.

**Nagasaki Damage.** At 11:02 a.m., seven hours after the Soviet Union declared war against Japan, the second military atom bomb exploded on Nagasaki to kill about 35,000 of its inhabitants by concussion, blast, and fire, and to injure 40,000.

Ground zero was a point just to the west of the right branch of the Urakami River, about 8,000 feet before it enters Nagasaki harbor. Therefore, it was the Urakami River valley which felt the full devastation of the atomic bomb, both the heat and shock waves. In this valley also, were located the large industrial plants, extending from Nagasaki Bay up the west side of the river.

The blast effect of the Nagasaki bomb was far more pronounced than that of Hiroshima because of the topography of the Urakami River valley, although the actual area destroyed was smaller because of the terrain and the bomb's point of fall. There were only 1.8 square miles destroyed in comparison with Hiroshima's 4.7 square miles.

Due to the protection afforded by the hills, more than half the residential units escaped serious damage. On August 1, 1945, there were 52,000 residential units in the city; on August 9, 14,146 of these were destroyed, representing 27.2 percent. Of these, 11,494 were burned and 5,441 were half burned or destroyed.

The Nagasaki Prefectural Report described the

stark impact of the bomb in this fashion: "Within a radius of one kilometer from ground zero, men and animals died almost instantaneously from the tremendous blast pressure and heat; houses and other structures were smashed, crushed, and scattered; and fires broke out. Trees of all sizes lost their branches or were uprooted or broken off at the trunk. Roofs of the reinforced concrete National Schools were crumpled and collapsed, indicating a force beyond imagination."

A survivor of the bombing called it "a blast so terrible that all those who felt it, thought they had been hit by an individual bomb."

Unlike Hiroshima, no "fire storm" occurred; there was, in fact, a shift in wind direction which helped control the fires. Once again, medical personnel and facilities were fatally stricken. More than 80 percent of the city's hospitals were located within a radius of 3,000 feet from ground zero and all were completely destroyed, including the Medical College. The mortality rate in this sector of buildings stood between 75 and 80 percent. But by November 1, half of the pre-bombing number of doctors, or 120 men, were back at work.

Utilities and services were disrupted; both gas plants were destroyed, electric power distribution and transmission systems were wrecked in the area of heaviest destruction, trolleys were halted.

Three bridges were displaced, the railroad stations were destroyed by blast and fire, and rolling stock was slightly damaged, chiefly by fire. Shipping was almost unaffected. Nagasaki is at the end of a railroad spur line and the major damage there was sustained by track and railroad bridges when the rails buckled intermittently for a distance of 5,000 to 7,500 feet from ground zero, at points where burning debris set fire to wooden cross ties.

The basic water supply was not damaged, although there were thousands of breaks in the residential feeder system plus eight bad breaks on a 14-inch line and four other breaks in another main line crossing the Urakami river.

Nagasaki suffered a higher percentage of destroyed and damaged buildings and factories than Hiroshima. In Nagasaki only the Mitsubishi Dockyards, among major industries, was far enough from the explosion to escape serious damage. The other three Mitsubishi firms, responsible for 90 percent of the city's industrial capacity (of these the Mitsubishi Steel Works turned out about 200,000 tons of finished steel products annually, and the Mitsubishi-Urakami Arms Plant produced up to 800 aerial torpedoes annually) were all actually damaged, with the steel and arms plants in the principal area of damage.

Of the damage at the steel works, the Japanese commanding officer of the Sasebo Naval District said: "Plant structures suffered extensive damage to roofs and walls; the frames were bent, twisted or toppled over, and several buildings caught fire. Hardly any of the machinery there could be used again in its present condition though nearly 70 percent of it could be repaired."

The blast effects, akin to the aftermath of a hurricane, were strikingly pronounced at Nagasaki. Long lines of steel-framed factory sheds, more than a mile from ground zero, leaned their charred outlines away from the explosion. Concrete buildings facing the blast had their sides caved in, while blast-resistant items such as telephone poles leaned away from the center of the explosion. There was no general conflagration at Nagasaki but evidence of primary fire was more frequent than at Hiroshima. And despite the lack of sanitary measures there were no epidemics.

It is an interesting fact that the 400 people who were properly placed in the city's tunnel shelters at the time of the bombing escaped injury unless exposed in the entrance shaft.

**Contrasts and Similarities.** The difference in the totals of destruction to lives and property at Hiroshima and Nagasaki points up the importance of the distinguishing circumstances of construction and layout of the cities, thereby affecting the results of the bombings.

Casualty rates at Nagasaki may be generally explained by the fact that there was a separation of the dispersed built-up pockets while at Hiroshima there was a uniform concentration of people in the center of the city. The Nagasaki bomb spent much of its energy against water, hills, and unoccupied sections whereas the Hiroshima bomb almost attained its maximum effect. It is conceded that the effectiveness of the Nagasaki bomb would have been five times greater had the bomb fallen on a target area not hemmed in by hills.

The one crushing common denominator at both cities was the great number of casualties; the exact number of dead and injured will probably never be known because of the fires, confusion, destruction of official records, and flights of entire families. But it was agreed that of those casualties who died later (after the initial blast), an increasing number succumbed to radiation effects; 95 percent of the traced survivors of the immediate explosion who were within 3,000 feet at both cities suffered from radiation disease.

A plausible estimate of the importance of various causes of death would be: flash burns, 20-30 percent; other injuries, 50-60 percent; radiation sickness, 15-20 percent.

The damaging penetration of radiation would be possible from three sources, but at Hiroshima and Nagasaki the only important effects were caused by high frequency radiations (neutrons, gamma rays, or other unspecified rays) that were released in the fission of the bomb. This was true though there were detectable pockets of radioactivity in both cities. Radiation appeared to have no lasting effect on soil or vegetation.

But the deadly rays proved lethal to humans and animals within a radius of 5,000 feet from ground zero and caused loss of hair within 7,500 feet radius, and milder effects up to two miles from ground zero. The first signs of the onset of radiation sickness were loss of appetite, lassitude, and general discomfort. Inflammation of the mouth, gums, and pharynx next appeared. Then, within 12 to 48 hours, fever became evident, varying from 100° to 106° Fahrenheit.

Individuals nearer the center of the explosion became ill within two to three days after the explosion. Those a greater distance away did not develop the symptoms for from one to four weeks, depending upon the distance between the victim and the explosion. A large percentage of the cases died of secondary disease: bronchopneumonia or tuberculosis, the result of lowered resistance.

When the bombs burst over Hiroshima and Nagasaki, a brief flash emitted radiant heat traveling at split-second speed. Flash burns thus followed immediately and those in the open directly under the explosion of the bomb were so severely burned that the skin was charred brown or black, with the victim dying within a few minutes or hours at the most. Freak cases of protection occurred in which persons whose sides were toward the explosion often showed burns on both sides of the back while the hollow of the back went unscathed. Those in buildings or houses were ap-

parently burned only if directly exposed through the windows.

The fate of industries in both cities illustrated the value of decentralization. All major factories in Hiroshima were on the periphery of the city and escaped serious damage; at Nagasaki, plants and dockyards at the southern end of the city were left intact, but those in the valley where the bomb exploded were seriously damaged. Although the damage in Hiroshima was greater than that in Nagasaki, it is generally agreed that the Nagasaki bomb was more powerful. Brigadier General Thomas F. Farrell, in charge of the atomic bomb operations, saw the results of both bombs and stated that the Nagasaki blast was by far the greater.

**The Atom Bomb versus Other Weapons.** A simple comparison between the two atomic bomb raids and the most effective "regular" air raid against Tokyo on March 9, 1945, plus a composite of the average of 93 air attacks in urban Japanese areas, shows the power of the atom bomb in its proper perspective.

For the atomic bombings, one plane was involved at both Nagasaki and Hiroshima; for the Tokyo raid, 279 aircraft participated; for the composite average, 173 planes took part.

One bomb was carried for each of the atomic bombings; 1,667 tons of bombs for the Tokyo raid; 1,129 tons for the composite average. These were incendiary, high explosive, and anti-personnel bombs.

Judging from the established destructiveness of various bombs evaluated from the war in the Pacific and Europe and from tests, the striking force necessary to achieve the similar destruction of Hiroshima and Nagasaki can be estimated. It would have amounted to 1,300 tons of bombs for Hiroshima (75 percent incendiary, 25 percent high explosive), and 600 tons for Nagasaki (25 percent incendiary, 75 percent high explosive).

In addition to the bomb loads, 500 tons (for Hiroshima) and 300 tons (for Nagasaki) of anti-personnel bombs would have been necessary to inflict comparable casualties.

To assure the same coverage of the target area, an additional allowance of 30 percent of bombs would have been required, bringing the total bomb load to 2,100 tons for Hiroshima and 1,200 tons for Nagasaki. Allowing 10 tons per plane, the attacking force required would have been 210 B-29s at Hiroshima and 120 B-29s at Nagasaki.

**JAPANESE PACIFIC ISLANDS (Nanyo).** The former German possessions in the Pacific, north of the Equator (130° to 175° E. and 0° to 22° N.), over which Japan was appointed mandatory in accordance with the terms of the Treaty of Versailles, 1919. The mandate comprised some 1,458 islands, islets, and reefs, extending over an area of 1,200 miles north to south and 2,500 miles west to east. There are three main groups: (1) **MARIANA or LADRONE** (14 islands), including Saipan, Tinian, Rota; (2) **CAROLINE** (577 islands), including Yap, Palau (Babeldaob), Koror, Truk, Ponape, Kusaie; (3) **MARSHALL** (60 islands), including Jaluit. Total area, 830 square miles. Some of the islands were conquered and occupied during 1944 by United States armed forces. In 1945, following the defeat of Japan, all the islands passed under the control of the Allies. On November 6, 1946, the United States requested that the islands be placed under United Nations trusteeship with the United States as administering authority. Population (1940 census), 131,157 (72,540 males and 58,617 females).

**Production and Trade.** The main products were

sugar, maize, coffee, phosphates, tapioca, bananas, breadfruits, copra, alcohol, vegetables, fish, forest products and bauxite. Trade (1938): imports were valued at U.S. \$8,723,000 (rice, machinery, cloth, oil, wax, wood and wood manufactures, cigarettes, and alcohol were the chief items); exports were valued at U.S. \$13,350,000.

**Government.** Budget (1940): revenue United States \$2,564,182; expenditure United States \$2,540,228. Under Japanese rule, the administrative affairs of the mandate were managed by a governor who was subject to the direction of the Japanese Minister of Overseas Affairs. Headquarters of the Governor were in Koror, one of the Palau islands in the western Carolines. During 1946, the United States utilized naval officers as administrators. Efforts were made to turn considerable autonomy over to the island residents.

**JARVIS ISLAND.** A mid-Pacific island (0° 23' S. and 159° 54' W.), south of Hawaii; owned by the United States. The island lies in the path of the main steamship lanes and airways from Honolulu to New Zealand and Australia. In former years guano was produced from the island but it remained uninhabited for years until 1936 when the United States Dept. of the Interior set up an aerological station.

**JEWISH WELFARE BOARD, National.** Organized in 1917 to serve as the united agency of the American Jewish community to provide religious, welfare and morale services to Jewish personnel in the armed forces. The National Jewish Welfare Board (JWB) is also the national association of 288 Jewish community centers and Y.M.H.A.'s and Y.W.H.A.'s in the United States and Canada, with a total membership of 437,000 men, women and young people. Affiliated with JWB in its program of service are 38 national Jewish organizations.

A joint citation, awarded by the U.S. War and Navy Departments to JWB for its "unique and outstanding service" to American servicemen and women, stationed throughout the world during World War II, was presented in May, 1946, at the annual conference of JWB, the first yearly JWB national meeting to be held since the beginning of World War II.

In 1946 JWB, a member agency of USO, operated 80 USO-JWB installations, and served thousands of men and women in the armed forces through its 626 local army and navy committees. At the same time, the 10 JWB hospitality centers in Germany, Austria, France, and China were provided with services by the 58 JWB hospitality center committees in the United States.

Accredited by the U.S. Veterans Administration since 1925 to represent veterans seeking benefits, JWB last year handled 12,230 claims for Jewish veterans and secured initial awards for 4,480 veterans. JWB also provides informational and counseling services to Jewish veterans through local veteran committees, organized in 82 communities throughout the country. Jewish patients in 100 Army and Navy hospitals were served by JWB staff, chaplains, volunteer workers, and visiting rabbis during 1946. To the 50 chaplains still on active duty with the armed forces in 1946, JWB, which recruited, endorsed, and supervised Jewish chaplains during World War II, sent religious literature and ceremonial items, as well as kosher foods, for distribution among Army and Navy personnel.

The third and final issue of *Fighting for America*, a book which tells the story of Jewish partici-

pation in World War II, was prepared by JWB in 1946 and will be published early in 1947. The task of compiling the facts and statistics, on which the three volumes of this chronicle were based, was completed by JWB at the end of 1946.

Plans for the establishment of a permanent national Jewish museum in Washington, D.C., depicting the contribution made by the American Jewish community in all wars of the United States, were authorized by the JWB Board of Directors last year.

By assisting its constituent Jewish community centers and Y's with their program plans and activities, JWB aims to promote the religious, intellectual, physical and social well-being of American Jews and to develop the growth of the American Jewish community. JWB provides these centers with printed program material and specialized aids for the adjustment of veterans, for vocational guidance, and for mass activities. In 1946 JWB made 950 bookings of lecturers, artists and musicians for Jewish communities in this country and Canada; and gave counsel on administration, personnel, and building problems to 93 communities engaged in center and Y building expansion campaigns.

A youth serving organization, JWB in 1946 helped found the World Federation of Y.M.H.A.'s and Y.W.H.A.'s and Jewish Community Centers. Last year it also extended its service for Jewish youth to communities in France and Latin America, sent field workers into those countries, and provided the Jewish communities there with program material.

Officers of JWB: Frank L. Weil, President; Mrs. Felix M. Warburg, Honorary Vice President; Mrs. Alfred R. Bachrach, Lloyd W. Dinkelspiel, Irving Edison, Mrs. Samuel R. Glogower, Mrs. Walter E. Heller, Carl M. Loeb, Jr., Donald Oberdorfer, Walter Rothschild, Vice Presidents; Joseph H. Cohen, Treasurer; Robert K. Raisler, Assistant Treasurer; Joseph Rosenzweig, Secretary; Ralph K. Guinzburg, Assistant Secretary; Louis Kraft, Executive Director. Headquarters: 145 East 32nd Street, New York 16, New York.

**JEWS AND JUDAISM.** Like the rest of the community the Jews of America devoted the first year after World War II to the readjustment of social conditions and the reorganization of their communal life, all of which had been affected by the strain and demands of the weary years of combat. At the same time they had to continue and to extend to a larger scale the work of relief, rescue, and rehabilitation in which re-settlement in Palestine occupies a predominant position. The extermination of about six million brethren by the Nazi hordes which had plunged Europe into the abyss of destruction had cast an unrelieved shadow over the whole of American Jewry; the hapless plight of the surviving men, women, and children in these European lands, with many thousands of the victims still seeking their kinsmen here and in other lands, brought the tragedy all the more vividly to the consciousness of American Jewry.

These tasks, replacing the burdens of the war years, weighed heavily upon the people of Israel in the United States though with the approach of peace the work could be pursued with a sense of ease and a feeling of grateful anticipation of future eventualities. The regular or permanent religious, philanthropic, and cultural endeavors, though to some extent interrupted during the period of war efforts, were nevertheless throughout carried on without any serious abatement. At the same time the knowledge of the destruction of the long-

established Jewish communities in European lands, which with their institutions of learning and intense religious and scholarly activities were always regarded as "reservoirs of the Jewish spirit" quickened the sense of obligation here to replace in this land the religious and cultural possessions which had been lost. With the numbers of Jews now living in the United States the hope is to evolve here a new spiritual center to emulate the religious and cultural aspirations of the vanished communities. Public utterances therefore stressed the need of building new sanctuaries of the spirit in the form of various types of educational organizations and institutions of learning.

In this instance pronouncement was actually accompanied by performance and, to begin with institutions of an academic character, there have been a number of developments of significance, in a sense heralding a new revival of learning. The orthodox theological seminary, Isaac Elchanon Yeshiva, and its more recently established division, Yeshiva College, Samuel Belkind, president, at Amsterdam Avenue and 187th Street, New York, N.Y., has of course been carrying on its work for a number of years, but the expansion of this organization into the Yeshiva University chartered by New York State, coincided with the general advance and enlargement of Jewish religious and cultural institutions. A chain of separate schools devoted to Jewish as well as general study will ultimately constitute the new enterprise.

In a program of broadening the scope of the Jewish Theological Seminary of America, Louis Finkelstein, president, which represents the Conservative wing of Judaism, a plan has been put forth within the last year and a campaign for funds launched for the establishment of a University of Judaism. The organization, at Broadway and 122nd Street, New York, N.Y., with its Jewish Teachers Institute and other departments and faculties is designed to occupy a commanding position in study, research, and scholarship pertaining to the essence and basic sources of religious teachings.

Responding to identical motives for intensification of study and learning as well as the increase of facilities for the encouragement of Jewish youth to take up such studies, the Hebrew Union College of Cincinnati, Julian Morgenstern, president, the center of Reform Judaism, has also witnessed much expansion during the past year. Similarly the other Reform theological seminary, the Institute for Jewish Religion, New York, N.Y., Dr. Stephen S. Wise, president, has carried forward with increased zeal and concentration the task of training rabbis and teachers. These four theological seminaries and schools of higher learning have, in accordance with the need and spirit of the time, extended the hospitality of their faculties to distinguished Jewish scholars from Europe who have suddenly been cast out of their life-long pursuits by the Hitler holocaust. The enlargement of their libraries, with the New York Seminary and the Cincinnati College possessing the most notable collections of rare volumes in the world, has been another feature of intensification of scholarly endeavor.

In another sphere of academic enterprise a long-discussed project, the founding of a more general Jewish university in America, has taken shape during the past year in the form of the Albert Einstein Foundation which is to establish the Louis D. Brandeis University, the use of these names being intended both as a tribute to the men whom they represent and as a means of attracting wider support. The undertaking is actuated, to an extent, by

the double motive of overcoming certain discrimination which blocks the entrance of Jews into some higher institutions of learning, especially medical schools, and of adding the Jewish identity to the other denominations which originally established a number of the first universities in the United States. The sponsors of this enterprise have taken over the campus and structures of the former Middlesex College at Waltham, Massachusetts, and the directors of the Albert Einstein Foundation, of which S. Ralph Lazarus of New York is president, are now engaged in a campaign for the raising of adequate funds to which many generous contributions have already been received.

In the field of activities carried on by the many congregations, synagogues, and temples of the different denominational groupings within Jewry representative of all the three schools of Judaism—or four if the new type of liberalism called Reconstructionism is to be included—the main and immediate tasks are in the hands of the several federations of synagogues which serve as the centers and the organizational as well as educational agencies of their affiliated places of worship. Though the Reform Jews represent the smaller proportion of the Jewish population their congregations are the better organized and their Union of American Hebrew Congregations, Maurice M. Eisendrath, president, is among the strongest and most active of the agencies. Its effective publication department now issues books of the highest quality. The United Synagogues of America, Samuel Rothenstein, president, speaking for the Conservative or middle-of-the-road element, and the Union of Orthodox Jewish Congregations of America, Samuel Nierenstein, president, serve as guides and leaders to their affiliated congregations, their women's auxiliaries assisting in educational, religious, and philanthropic work of different types. In the interpretation of Judaism and formulation of religious opinion the several Rabbinical associations, from the Orthodox to the Reform, play a significant part, their annual gatherings furnishing a means of discussion and exposition of basic tenets.

The past year witnessed an extension of the organization, in New York and other cities, of *Yeshivas*, the old type of religious schools approximating from high school to college grades entirely devoted to religious and Hebrew study, this trend being accompanied by a considerable increase of Jewish parochial schools, corresponding to such institutions of other religious sects.

The unparalleled destruction of Jewish lives and the unprecedented devastation of communities which World War II has wrought in Europe have left behind in their wake destitution and suffering which cannot easily be described. About 300,000 have concentrated in the different zones and especially the American zone in Germany. Outside of this number Europe now holds a reduced Jewish population of 700,000 exclusive of approximately 2,500,000 persons dwelling in Soviet Russia where political conditions prevent direct intercourse with the Jewries of other lands.

While the war was still in progress and Nazi Germany was continuing its deliberate and ruthless campaign of exterminating all Jews by gas chambers, crematoriums, and other diabolical means, Jewish protective and relief organizations attempted to rescue some of the men, women, and children in Germany, Poland, and other invaded countries who were still within reach of some help and succor. But most of these efforts were frustrated by prohibitive and dangerous war conditions. Only small numbers succeeded in escaping the horrors

inflicted by the assailants and the largest proportion of these ultimately made their way to Palestine despite England's restriction of immigration into the Jewish homeland that, in 1917, it solemnly pledged to help establish. While the guilt for the destruction of the largest portion of European Jewry, as fully confirmed by the Nuremberg trials, rests upon Germany and the other Axis powers, the Allied and associated powers, it is felt by Jewish leaders, are not without blame for failing to back more actively the fitful attempts at rescue. The United States, however, through the special interest of President Franklin D. Roosevelt, made several gestures toward providing havens for refugees, these attempts finally leading up to the establishment of a temporary resting place for about 1,000 persons in Oswego, New York. A directive of President Truman issued on December 22nd, 1945, intended to facilitate the admission of displaced persons resulted in the entrance of only 4,767 individuals—outside of those who entered as part of the regular immigration quotas—although reports of the shipping industry gave the figure as 21,589. However, new steps were taken to provide adequate steamship facilities so as to relieve the crowded and deplorable conditions now prevailing at ports of embarkation.

The work of immediate relief carried on during the war through neutral countries and the post-war activities pursued later on a larger scale devolved mainly upon the American Jewish Joint Distribution Committee, which had gone through similar tragic experiences in World War I. Auxiliary efforts were carried on by several smaller agencies like the Vaad Hazelah formed by orthodox rabbis; this agency, while the war was still on, made special efforts to rescue Jewish scholars, spiritual leaders, and students for the rabbinate in several different countries. The Joint Distribution Committee, made up of representatives from various groups in Jewry, is headed by Edward M. Warburg. It is now operating through its representatives in twenty or more countries, with permanent offices in a number of the larger centers of the surviving Jewish population and in the camps of displaced persons in Germany. Trying conditions in Poland, Rumania, and Hungary and other neighboring countries have caused homeless people to drift from one place to another and these wanderers and many Jews making their way from Soviet Russia into Poland and further into Germany have increased the numbers of and aggravated conditions among displaced persons. This problem formed one of the first and most urgent tasks of the American Jewish relief organizations. Thanks to the excellent cooperation of the American Military Government in Germany it was possible to render the required relief and to an extent regulate the sojourn of the homeless people in Germany and to facilitate the movement of those who were in a position to emigrate. On October 7th, 1945 Judge Simon H. Rifkin, New York, of the United States Federal Court, was appointed as advisor on Jewish affairs to General Dwight D. Eisenhower, Commander-in-Chief of United States forces in Europe, and subsequently Rabbi Phillip Bernstein of Rochester, New York, who during the war directed the work of Jewish chaplains in the program of the Jewish Welfare Board, was appointed in a similar capacity by General Joseph T. McNarney. Through the counsel of these men and the efforts of representatives from the relief agencies, conditions of the homeless Jews in the camps were made more tolerable by provisions for food, clothing, and for study, work, and religious observances.

Funds for the relief work of the Joint Distribution Committee in European and other lands as well as for the tasks of resettlement in Palestine have been collected by the United Jewish Appeal, which takes in these two bodies as well as the former National Refugee Service, Inc., now known as the United Service of New Americans, Charles A. Riegelman, chairman. All Jewish forces, regardless of point of view, have joined hands in this drive. The total sum of one hundred million dollars was collected in 1946 and it is planned to campaign for a larger fund during the coming year.

Early in 1946 President Truman had instructed Earl G. Harrison, American representative on the Inter-Governmental Committee on Refugees and former United States Commissioner of Immigration, to inquire into the situation "of those displaced persons in Germany who may prove to be stateless or non-repatriable." The Harrison report, made public on September 29, established two facts: (1) that the displaced persons must be evacuated from the camps in Germany and Austria; (2) that the overwhelming majority of Jews in the displaced persons camps want to go to Palestine. The President sent a letter to Prime Minister Attlee on August 31 in which he concurred with the conclusions of the report and asked that 100,000 immigration certificates to Palestine be granted to "Jews still in Germany and Austria and for other Jewish refugees who do not wish to remain where they are or who, for understandable reasons, do not desire to return to their countries of origin." This letter and the reaction to it of the British Government led to a number of other official steps. (See ZIONISM.)

The "Big Four"—the American Jewish Congress, the American Jewish Committee, B'nai Brith, and the Jewish Labor Committee—among the civic protective organizations working in conjunction with the American Jewish Conference cooperated in 1946 with various Jewish organized forces from different lands, like the Board of Deputies of British Jews and the French Alliance Israelite Universelle, at the Paris Peace Conference in July of this year. Here the treaties adopted with Hungary and Rumania made specific reference to the Jewish demands, and the right of the Jews to ask reparations was acknowledged by the decision under which the Allies allotted \$22,500,000 from the German reparation funds to the Inter-Governmental Committee on Refugees for work on resettlement of displaced Jews. Awaiting further confirmation is a decision by which heirless Jewish property in Rumania and Hungary would be turned over to local Jewish communities.

Still aspiring for the unification of all American Jews for future purposes from the point of view of speaking and acting for the whole community in the protection of general interests, the American Jewish Conference through a special sub-committee is now exploring the possibility of creating an over-all permanent organization after the present activities with regard to European refugees and future guarantees of rights for all will have been completed.

Despite ideological differences with the Zionists, who have the sympathy of the largest number of American Jews, the American Jewish Committee and other dissident groups have lately come closer to the Zionist ideal, though from a nonpolitical attitude. Similarly the Central Conference of American Rabbis and the Union of American Hebrew Congregations, which were formerly opposed to the strivings for Jewish national revival, have lately given their endorsement to the idea of a Jewish

spiritual center in ancient Judea. Finding various fields of religious, philanthropic, and cultural work on which they could agree, the large central organizations pool their interests on many occasions. Among the domestic tasks carried by the four civic protective organizations, through joint or separate action, is the effort of combating anti-Semitism and racial and religious prejudice of every form. From this point of view all groups welcomed the following resolution of the United Nations, adopted at its recent session in New York:

"The General Assembly of the United Nations declares that it is in the higher interests of humanity to put an immediate end to religious and so-called racial persecutions and discriminations, and calls on the Governments and responsible authorities to conform both to the letter and to the spirit of the Charter of the United Nations, and to take the most prompt and energetic steps to that end."

BERNARD G. RICHARDS.

**JOHNSTON ISLAND.** An atoll in the central Pacific, 809 air miles southwest of Honolulu, belonging to the United States. Useful as an advance observation post in the Hawaiian defense system, it is under the jurisdiction of the United States Navy Department. With funds appropriated by Congress in 1939 and 1941, the atoll was converted into a naval base for aircraft and submarines. On May 15, 1941, the island was designated a "naval defensive sea area" and on Aug. 15, 1941, the naval air station was commissioned. During World War II the island remained under the control of United States armed forces.

**JOINT BRAZIL-UNITED STATES DEFENSE COMMISSION.** A Commission composed of military delegates (Army, Navy, and Air Forces) of the two countries, established in August, 1942. Meetings are held in Washington for the purpose of making staff plans for the mutual defense of the Western Hemisphere. U.S. Chairman: Rear Adm. Marshall R. Greer.

**JOINT CHIEFS OF STAFF, U.S.** Under the direction of the President, the Joint Chiefs of Staff consult together on matters of joint concern to the armed forces, advise the President as to their use, and take appropriate action to implement his plans and policies as Commander in Chief of the Army and Navy. The Joint Chiefs of Staff comprise the United States membership of the Combined Chiefs of Staff.

**Army and Navy Staff College.** The Army and Navy Staff College was established pursuant to a directive issued by the Joint Chiefs of Staff on April 23, 1943. Officially opened on August 5, 1943, the College operates under the direction of the Joint Chiefs of Staff. It provides a special course of instruction for specially selected and qualified Army, Navy, and Marine Corps officers in order to increase efficiency in the performance of command and staff duties in unified and coordinated operations of the Army and Navy forces. The College was redesignated the National War College, effective on July 1, 1946.

**JOINT MEXICAN-UNITED STATES DEFENSE COMMISSION.** A Commission organized Jan. 12, 1942, to study problems relating to the common defense of the United States and Mexico, to consider broad plans for the defense of Mexico and adjacent areas of the United States, and to propose to the respective governments cooperative measures. U.S. Chairman, Maj. Gen. Guy V. Henry, U.S.A.

**JUILLIARD MUSICAL FOUNDATION.** A foundation incorporated in New York State in 1920, in accord-

ance with the will of Augustus D. Juilliard, to aid worthy students of music, promote the instruction of the general public in the musical arts, and to encourage a deeper interest in music in the United States. Invested trust funds had a book value of about \$12,000,000 in 1946; only the income is distributed. Secretary: M. Steilen, 31 Nassau Street, New York 5, New York.

**JUSTICE, U.S. Department of.** A Department of the U.S. Government which in 1946 had the following divisions and offices.

Office of the Attorney General  
Office of the Solicitor General  
Office of the Pardon Attorney  
Antitrust Division (q.v.)  
Tax Division  
Claims Division  
Lands Division  
Criminal Division  
Customs Division  
Administrative Division  
Federal Bureau of Investigation (q.v.)  
Bureau of Prisons  
Immigration and Naturalization Service  
Board of Parole  
Board of Immigration Appeals

Attorney General in 1946: Thomas C. Clark. Solicitor General: J. Howard McGrath.

**JUVENILE DELINQUENCY.** Public interest in juvenile delinquency became intense during the war and is still high. Some of this interest is directed constructively toward improving conditions for young people. Some of it is unconstructive, born of the excitement caused by spectacular crimes of a relatively few boys and girls, and growing on statements about increase in "juvenile crime" that are not supported by facts and on the age-old cliché that each generation of youth is worse than the last. Unfortunately, no statistics exist to show the Nation-wide extent of juvenile delinquency or its increase. An answer to the question of trend is frequently sought in statistics on children brought before juvenile courts, but these statistics have definite limitations for national, State, or local use because they are an incomplete measure of juvenile misbehavior. They are greatly affected by variations in local attitudes, in age jurisdictions of different courts and in court practices, and by wide variations in the extent to which methods of handling problems exist other than reference to the police or to the courts. What these court statistics do show, through year-to-year comparison, is the trend in volume of cases disposed of by a given number of juvenile courts; if used with recognition of their exact nature, they have their value.

**Extent.** A series of juvenile-court statistics has been maintained since 1926 by the U.S. Children's Bureau. In this series, 364 courts reported both in 1944 and in 1945, making possible a comparison between the two years for this group of courts. The total number of delinquency cases disposed of by these 364 courts in 1945 was 6 percent higher than in 1944; the number of boys' cases was 8 percent higher, while the number of girls' cases was 4 percent lower. In the girls' cases, the decrease for courts serving areas with populations of less than 100,000 was more pronounced (8 percent) than the decrease for courts serving areas with larger populations (3 percent).

Of courts serving areas with populations of 100,000 or more, 76 have submitted comparable data since 1938. For these courts, in the boys' cases, comprising more than four-fifths of the cases disposed of, the increase of 8 percent from 1944 to 1945 reversed a decrease noted from 1943 to 1944 and continued a generally upward trend of several

years. The number of girls' cases increased each year from 1939 to 1943; since then they have decreased, dropping 5 percent from 1944 to 1945.

That public interest remains at a high level is fortunate because the increase in the number of cases disposed of by juvenile courts in 1945 as compared with 1944 indicates that communities should intensify rather than relax efforts put forth during the war to strengthen preventive services for children.

The total number of courts reporting in 1945 differed only slightly from the preceding year and their reports showed no marked changes from 1944 in the relative distribution for each of the factors analyzed. During 1945, 122,851 delinquency cases were disposed of by 374 juvenile courts serving areas representing almost two-fifths of the country's total population, 101,240 boys' cases and 21,611 girls' cases. The greatest concentration of children referred to court was in the 14 to 16 age group. The ages when referred to court were reported in 91,435 of the boys' cases and 18,980 of the girls' cases. Of these, 36 percent of the boys' cases and 43 percent of the girls' cases involved children in the 14 to 16 age group. In 4 percent of the cases the children were under 10.

The reasons for reference to court were reported in 92,671 of the boys' cases and in 19,268 of the girls' cases. Of the boys' cases "stealing," with 42 percent, ranked first in the reasons for reference; "acts of carelessness or mischief," with 19 percent, was next. Of the girls' cases 59 percent were referred to court for "being ungovernable," "running away," or "sex offenses." These three reasons must be considered together, because the first two frequently involve sex offenses and some courts use the term "ungovernable behavior" to avoid recording a sex offense.

The types of disposition were reported in 114,887 of the total number of cases disposed of by these 374 courts. Of these, 43 percent were dismissed, adjusted, or held open without further action; in 30 percent the child was referred to a probation officer for supervision; and in 9 percent, the child was committed to or referred to an institution.

**A Change in Reporting.** On January 1, 1946 the Children's Bureau initiated a revision of its juvenile-court statistical reporting program in order to make more significant and effective the resulting statistics and to achieve greater efficiency and economy in their collection and tabulation. Under the revised plan, the Bureau discontinued direct collection of statistical reports from individual courts and will tabulate only summary reports received from State agencies concerned with juvenile or probation work, based on individual court reports to the State agencies. This form of collection will extend materially the geographic coverage of the series to include more urban and rural courts in all sections of the United States.

The revised reports will include: (1) a count and analysis of all children's cases—delinquency, dependency and neglect, and special proceedings—disposed of officially and unofficially during the calendar year, and (2) an unduplicated count of the number of different children involved in all children's cases disposed of during the year. Because one child may appear before the court more than once during the year and each appearance is usually counted as another case, this count is important. It will indicate to local social agencies the number of children likely to need services. Reports of this nature will present a better picture of the work of the juvenile courts and will be extremely

useful in State and local planning of programs of preventive and treatment services for children.

Another approach to the improvement of statistics on delinquency is an experimental registration of juvenile delinquents undertaken in the District of Columbia by the Children's Bureau in cooperation with the Washington Council of Social Agencies. The experiment employed the technique of central registration of children whose behavior was reported as delinquent by the six official agencies in the city concerned with children's behavior difficulties. The results of this study indicated that a large number of children alleged to be delinquent were not known to the juvenile court during the registration year, having been dealt with by the police or by other agencies without referral to court. The study also indicated that because of duplication in the statistics for any two agencies, central registration may be the only feasible method for making a completely unduplicated count on a community-wide basis of "delinquent" children. Central registration, as yet not thoroughly tested, may be a step toward improved measurement of juvenile delinquency and toward better community planning of services for children.

**Legislation.** Congress contributed to basic preventive measures by increasing the appropriation for child-welfare services administered by the U.S. Children's Bureau under the Social Security Act from \$1,510,000 to \$3,500,000. This act, as passed in 1935, provides for grants to the States "for the purpose of enabling the United States, through the Children's Bureau, to cooperate with State public-welfare agencies in establishing, extending, and strengthening, especially in predominantly rural areas, public-welfare services for the protection and care of homeless, dependent, and neglected children, and children in danger of becoming delinquent." The increase will make possible a greater number of child-welfare workers, as yet far too few, whose basic services in a local community can help in his own home a child with behavior difficulties and can stimulate the responsible groups in a community to improve conditions for the welfare of all the children.

Despite the value of this program to children and their parents, limitation of funds and of qualified personnel, particularly during the war, has kept the program relatively small. Only one full-time child-welfare worker paid from Federal, State, or local public funds was available, on an average, for approximately every 25,000 children under 21 years of age throughout the country, as of June 30, 1945. Yet, about 230,000 children, it is estimated, were receiving services from public-welfare workers employed by State or local agencies on June 30, 1946. One-seventh of these children were served by child-welfare workers paid in whole or in part from Federal funds.

The program emphasizes the availability of services locally; getting services to children in their own homes early, while family conditions are improvable; organization of communities for the welfare of all children living there; and, more recently, preventing the social handicapping of children and making services available to them regardless of the economic status of their families, that is, independently of financial assistance. Related to the second concept mentioned, services in their own homes early, is the fact that in the 42 States from which reports were substantially complete, 42 percent of the children receiving services were living with their parents or relatives, 38 percent in foster family homes, 15 percent in institutions, and 5 percent elsewhere.

Other Federal legislation of 1946 will help in getting at the causes of juvenile delinquency and of children's behavior problems. Increased Federal contribution to the program for aid to dependent children under the Social Security Act (administered by the Bureau of Public Assistance, Federal Security Agency) has an effect on the causes growing out of economic deprivation. The National Mental Health Act provides through Federal grants for research and for demonstration mental-health services, part of which are specifically for children and so will give impetus to treatment of as well as measures for preventing the emotional causes of children's behavior difficulties.

In State legislation, Mississippi passed a new juvenile-court law, known as the Youth Court Act. The act provides for better care and protection of neglected children and for the hearing of cases concerning children with behavior problems, not as criminals, but as maladjusted children in need of understanding and guidance, and for furnishing assistance to the court in obtaining the information necessary to implement this service.

**Publications.** Two reports, significant in this field, were issued during 1946: *Detention for the Juvenile Court; a discussion of principles and practices*, by Sherwood and Helen Norman, a publication of the National Probation Association, and *Children in the Community; the St. Paul experiment in child welfare*, by Sybil A. Stone, Elsa Castendyck, and Harold B. Hanson, M.D., publication 317 of the U.S. Children's Bureau. The first is a preliminary, partial report of a national study of juvenile detention made in 1945 in order to discover good types of detention care and procedures that detained as few children as possible and for as short a time as possible, in suitable, classified quarters and with recognition of the skill required to deal with children at this critical time in their lives.

The preliminary report is a practical working guide for improving facilities or establishing new ones and will be followed by supplements giving building designs and criteria for evaluating detention facilities as well as practical data on staff, program and discipline, and boarding homes. The full report, when published, will be valuable for civic-minded groups. They will learn of the shockingly bad conditions under which children are detained, sometimes for long periods and without sufficient reasons. They will learn that good physical care is not the only aim in good detention care. The report says of the need for education about detention:

"In most communities there is very little general understanding of the juvenile court, less still of the place of detention care in the work of the court. The notion persists in the mind of the public that a few days in the detention home will persuade a boy to go to school or a girl to stay home at night, or that a few days without their children will persuade parents to take better care of them. It is not only the public that must be dispossessed of the threat and punishment idea of detention, but often the police, the schools, and even probation officers and juvenile court judges. As long as this concept persists, people will reject the idea of improving anything about detention except appearances, food, and sanitation. Detention care must be seen as a service which sustains the child at a time of crisis and prepares him to accept the reconstructing experience ahead. Until there is widespread acceptance of this view there will be no effective public demand for better budgets, better staff, and a positive approach to the whole problem."

The second publication mentioned reports on an experimental project carried on by the Children's Bureau in St. Paul, Minnesota, from 1937 to 1943. The demonstration was planned to develop experience in early identification of behavior difficulties in children and in the coordination of preventive and treatment services for children in this

field that would be applicable in any urban area. The project gave actual services, stimulated and took part in various community activities, and stressed the coordination of health, education, law-enforcement, recreation, and case-work services.

**The Year's Points of Interest.** Discussion of responsibilities of law-enforcement agencies in the fight to prevent juvenile delinquency indicated a lack of agreement among the enforcement agencies on the question whether they should take on any responsibility for social-service functions in addition to straight police work. Discussions highlighted the interrelations of police departments and other community agencies such as juvenile courts, schools, social agencies, and child-guidance clinics; the training of police officers in the methods of preventing delinquency and in dealing with juvenile offenders at the time of arrest; and development of juvenile aid bureaus in police departments.

Interest in State training schools revived during 1946. They were busy taking stock of themselves after their difficulties of the war days. Few ever adequately staffed, they lost young staff members to the armed forces and older, technically skilled staff members to war industries. Though the numbers of children committed to them may have increased, the schools could not add to their buildings or equipment or even keep them in good repair. Now they are starting to rebuild staffs and plants, and replenish equipment. In doing so, the best administered schools are trying to help the people of their States to understand what training schools are supposed to do and how they can best do it. A training school has an outstanding role in the treatment of children already "delinquent" and needing the therapy of group life. A child is sent there when he is found to be incapable of adjusting to his own home or to some other family home. These schools are not places of punishment or correction. They should be specialized stations for remodeling fundamental attitudes and for training for life in the world outside the school.

The schools vary from State to State according to many factors—the economic and social progress of the State, adequacy of funds from the legislature, the caliber of the State's educational system, the number and types of other State institutions for children. The availability of other institutions may save the training school from being used as a catch-all for every type of child who needs institutional training, to the detriment of the children rightly sent there to be reeducated for life.

All the topics mentioned here—and more—were discussed at a National Conference for the Prevention and Control of Juvenile Delinquency held in Washington in November at the invitation of the Attorney General of the United States. His interest grew out of concern with the problem of about 1,500 juveniles under control of the Department of Justice, and the relation between violations of Federal laws by juveniles and community conditions that engender delinquency. The 800 members included representatives of all groups interested in the problem of delinquency.

Some months before the conference, preliminary panels prepared drafts of reports on the current situation and the needs in each of a number of fields concerned with juvenile delinquency. These fields as named in the reports are: Community coordination; juvenile-court law; juvenile-court administration; detention; institutional treatment of delinquent juveniles; role of the police in juvenile delinquency; housing, community development, and juvenile delinquency; recreation for youth; mental health and child-guidance clinics;

youth participation; citizen participation; case-work-group-work services; the church; the school as a preventive agency; home responsibility; rural aspects of juvenile delinquency; and statistics. A panel on press, radio, and motion pictures also met, to report later.

After the opening meeting, each delegate attended sessions of a discussion panel in one of the fields to consider the draft report prepared previously. After the panel had discussed and amended the draft, the chairman of that panel presented a summary of the report and recommendations to the full conference at its closing session. The conference did not vote on adopting these reports, but they were referred to the executive committee for consideration.

The conference created a continuing committee of 33 to stimulate interest and action; but all the agencies and individuals who took part were made responsible for implementing the work at local levels. They were charged with awakening the mind and conscience of every community in the Nation to action that will assure children and youth the conditions for wholesome life.

KATHARINE F. LENROOT.

**KARAFUTO.** The Japanese part (south of 50° N.) of Sakhalin island; occupied and taken over by the U.S.S.R. following the defeat of Japan by the Allies in 1945. Area, 13,935 square miles. Population (census of October, 1940), 414,891. Chief towns (January 1, 1938, populations): Toyohara, the capital, 37,365; Esutoru, 31,959; Sliikka, 24,399; Otomari, 24,269. Chief products: paper, fish, coal, and petroleum.

**KELLOGG FOUNDATION.** A Foundation established by W. K. Kellogg in 1930 to advance the well-being of children without regard to race, creed, or geographical boundary. Expenditures for year ended August 31, 1946, were \$2,023,317.37. Total capital assets on that date were \$47,768,867.15.

The Foundation has undertaken and administers the Michigan Community Health Project, a health program involving seven counties in southwestern Michigan. The present program includes also national and international health promotion activities and the granting of fellowships. President and General Director: Emory W. Morris. Headquarters: Battle Creek, Michigan.

**KENYA.** A colony and protectorate of British East Africa. Area, 224,960 square miles. Population (1944 estimate), 3,940,469. Capital, Nairobi. The territory is administered by a governor, with the aid of an executive council and a legislative council of 40, including 11 elected European members, 5 elected Indian members and 1 elected Arab member. By the Kenya Annexation Order in Council, 1920, the territories of the mainland, excluding the mainland dominions of the Sultan of Zanzibar, were recognized as a colony while the coastal belt rented from the Sultan of Zanzibar remains a protectorate. The British Under-Secretary for the Colonies, Arthur Creech Jones, visited Kenya in July and suggested that certain constitutional changes in Kenya, in line with those taking place in other colonies, might soon come about.

Agriculture, pasture, forestry and mining are important occupations. The principal crops include coffee, maize, wheat, sisal, tea, flax, and pyrethrum. Hides are exported in considerable amounts. The chief exports (with Uganda) in 1944 were cotton and cotton seed (£5,263,995), mainly from Uganda, coffee, pyrethrum, sisal and tea.

**KINGMAN REEF.** An atoll in the Pacific Ocean 1,067 miles southwest of Honolulu, Hawaii, owned by the United States. The reef is about eight miles long and the lagoon five miles wide, but only a small area of land remains uncovered at high tide. The Navy Department has jurisdiction over the atoll. Its strategic importance is due to its being the only seaplane base located between Honolulu (1,067 miles to the north) and Pago Pago (1,797 miles to the southwest).

**KOREA.** A peninsular country in Eastern Asia bounded on the north by South Manchuria, on the extreme northeast by the U.S.S.R., washed on the west by the Yellow Sea, on the east by the Sea of Japan. Korea was a part of the Japanese empire from 1910 until Japan's surrender to the allied forces in September 1945; at that time the area north of 38° north latitude was occupied by Soviet forces, the area south of the 38th parallel by United States forces.

**Area and Population.** Area: 85,246 square miles. United States area: about 36,700 square miles. Total Korean population as of August 1946 was estimated officially at 27,621,000 persons, of which 13,275,000 were in South Korea. Foreign population in South Korea, exclusive of occupational personnel, was estimated at 10,300. Chief cities: Seoul (Keijo), the capital, 935,464 inhabitants in 1940; P'vongyang (Heijo), 285,965; Pusan (Fusan), 249,734; Chongjin (Seishin), 197,918; Taegu (Taikyū), 178,923; Incheon (Jinsen), 171,161.

**Education and Religion.** The Koreans have their own spoken and written language. About 40 percent of all adults were illiterate because of the Japanese policy of attempting to stamp out the Korean language. There are many modern schools, and rapid expansion in education is taking place. School attendance in South Korea, May 1946, was: elementary, 1,613,826; secondary, 99,308; higher, 10,315. There were 26 colleges and universities in South Korea in April 1946, the largest being Seoul University (formerly Keijo Imperial University). The chief organized religions are Confucianism, Buddhism, and Christianity; Shamanism has a strong hold upon the common people.

**Government.** Under Japanese occupation, the country was ruled by a Governor-General appointed by the Emperor of Japan, and an administration composed mainly of Japanese. Sixty percent of the population and the capital, Seoul, is in the American zone, which is governed by American Military Government. The Soviet zone is governed by a Central Executive Committee under Soviet control. On December 27, 1945 an agreement was announced at the Moscow Foreign Ministers' Conference providing for the formation of a Joint Soviet-American Commission to arrange for the establishment of a Korean Provisional Government, the elimination of the 38th parallel division, and the possible institution of a four-power (United States, Union Soviet Socialist Republic, United Kingdom, China) five-year trusteeship. The Commission adjourned on May 8, 1946 without reaching an agreement.

The Moscow Decision in December 1945 of the Foreign Ministers of the United Kingdom, the United States, and the Union of Soviet Socialist Republics, with a view to the reestablishment of Korea as an independent country, provided for the creation of a provisional Korean democratic government which was to take "all necessary steps for developing the industry, transport, and agriculture of Korea and the national culture of the Korean people." The Moscow Decision also provided for

establishment of a joint commission, consisting of United States and Soviet representatives, which was to assist in the formation of the provisional government. In preparing its proposals this Commission was to consult with the "Korean democratic parties and social organizations." The Commission's recommendations were to be presented for consideration by the Governments of the Union of Soviet Socialist Republics, China, the United Kingdom, and the United States prior to final decision by the Governments represented on the Joint Commission.

Provision was made also for the Joint Commission, with the participation of the provisional Korean democratic government and of Korean democratic organizations, to submit proposals for the joint consideration of the Governments of the United States, Union of Soviet Socialist Republics, United Kingdom, and China "for the working out of an agreement concerning a four-power trusteeship of Korea for a period of up to five years." The decision also called for the holding of a joint conference to consider measures establishing "permanent coordination in administrative-economic matters" between the United States command in Southern Korea and the Soviet command in North Korea.

**Events, 1946.** After forty years of Japanese occupation, Korea found its hopes for independence beset by a variety of problems ranging from the difficulties attendant upon United States and Soviet occupation forces to a chaotic and divergent internal political situation. The promise of freedom in the Cairo Declaration was reiterated by President Truman in August, 1945, shortly before United States troops occupied southern Korea and made contact with Soviet troops at Kinko, on the thirty-eighth parallel. Thereafter, the country was divided into two zones, north and south of the thirty-eighth parallel, with little liaison in 1945 between the two military governments. From the outset, the administrative policies of the two occupation forces differed; the Soviet Union permitted considerable self-government through Communist-dominated executive committees which controlled administrative, industrial, and financial organizations, while the United States assumed and retained control of economic affairs without inviting participation by the Koreans.

The political situation was complicated by a plethora of forty-three political parties. At a conference in Seoul in November 1945, in which all parties were represented, a resolution was passed demanding the end of the dual occupation, independence, and abandonment of the United Nations concept of Korean trusteeship. The welter of political parties were mainly divided into two major groups; one embracing the Korean Provisional Government which was Nationalist and moderate in character, and the other gathering around the Korean People's Government representing the extreme Left under Communist leadership. The Korean Provisional Government under the leadership of Kim Koo was set up in Chungking in 1940, but had not obtained recognition from any of the Allied powers. In the Moscow Conference of December 1945, the "Big Three" agreed to establish a joint commission, consisting of United States and Soviet representatives, to prepare proposals, with the consultation of Korean democratic elements, for the formation of a Provisional Korean Democratic Government. After creation of this Government with the approval of the Union Soviet Socialist Republic, China, the United Kingdom, and the United States, the Moscow agreement envi-

sioned a Four-Power trusteeship of Korea up to five years, during which the Powers would aid the development of Korea toward national independence.

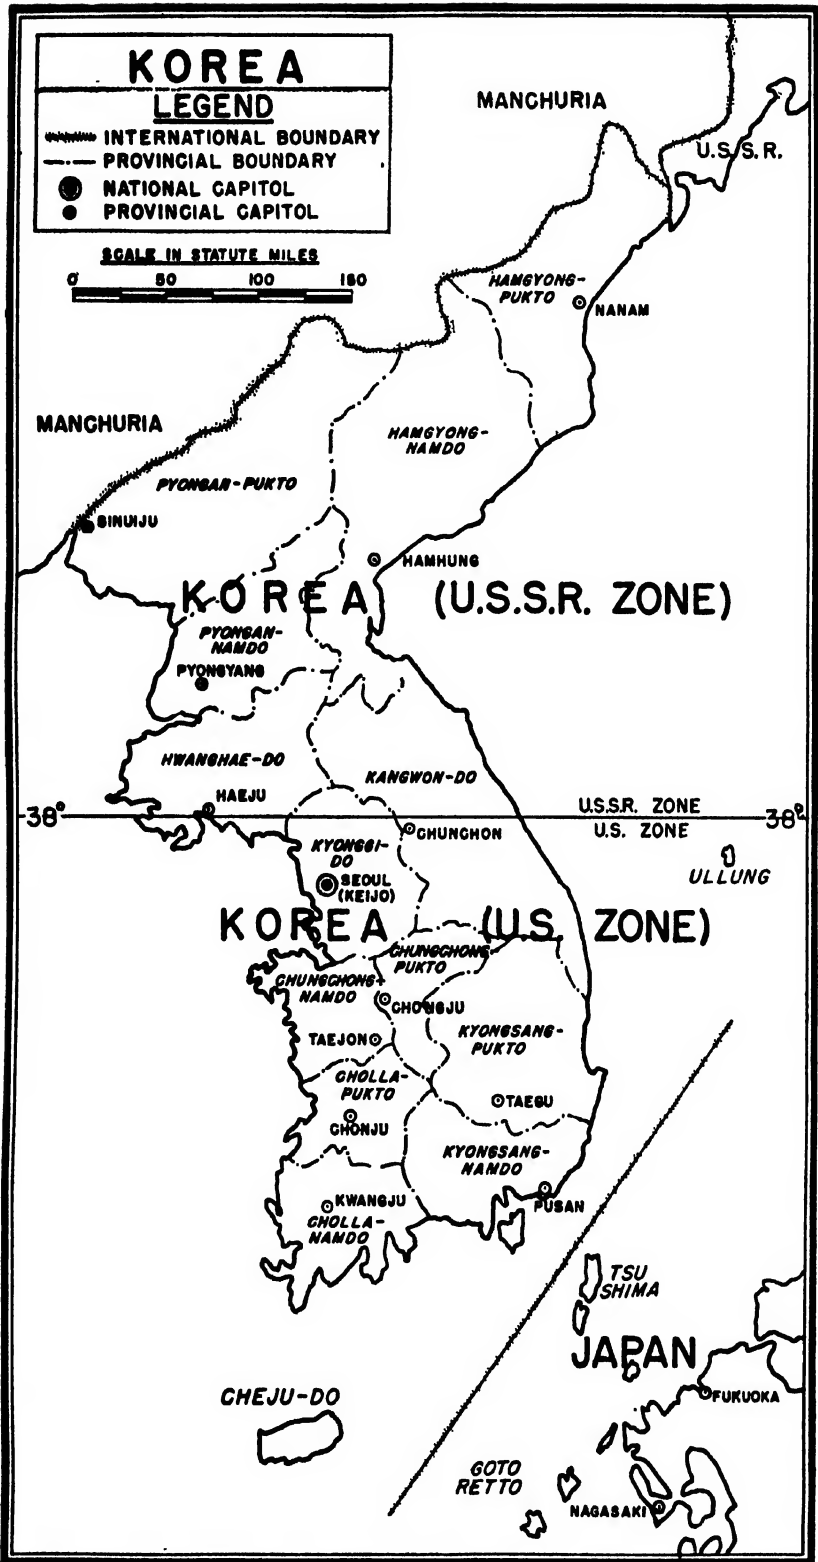

Resentment against occupation authorities and the trusteeship concept found voice in numerous disorders and demonstrations with a threat of a general strike mostly inspired by Kim Koo's unofficial Korean Provisional Government. After reassurance by Lt. Gen. John R. Hodge, commander of United States forces in Korea, that the intention of the Moscow Declaration was to give Korea independence at the earliest possible time, a serious demonstration was called off in Seoul on January 1. The United States attitude toward an immediate possibility that the Koreans could accept responsibility for their own administration was shown by Gen. MacArthur's report to the War Department, in which Korea was depicted as helpless to govern itself because of the numerous political parties and an "almost complete absence of qualified Korean administrators untainted by Japanese collaboration."

The artificial thirty-eighth parallel boundary line that prevented any integrated Korean economy constituted the prime point of discussion between United States and Soviet occupation authorities that met at Seoul on January 16. The meetings, clothed in the greatest secrecy, was divided into two phases: one to discuss implementation of the fourth clause of the Moscow agreements which authorized staff talks on "urgent problems" arising from the Korean division, and the other to work out details for the establishment of a provisional government on a democratic basis.

Midway in the discussions a controversy was caused by a dispatch from Soviet news agency Tass in which the United States command in southern Korea was accused of assuming "a position of inspiring reactionary demonstrations against the decisions of the Moscow Conference." The demonstrations, a manifestation of anti-trusteeship sentiment, provoked leftist charges that the Kim Koo groups were misleading the people. Immediate reply to the charge came unofficially from Gen. MacArthur's headquarters in which Tass was rebuked for joining "a definite program to discredit" the Supreme Commander and force changes in occupation policy. Simultaneously, Lt. Gen. Hodge denied the charge and said that his encouragement of free speech and free press might have been misinterpreted.

A joint communique issued on February 8 disclosed that the occupying powers had reached agreement to re-establish contact between the north and south halves. Although the thirty-eight parallel would continue to divide the two commands, the barriers had been lowered to permit inter-zone railroad, motor, and coastwise waterborne transportation and exchange of mail. It was anticipated that Korea's economy would be greatly bolstered by these agreements, for it would permit a flow of agricultural and fishery products into the North and raw materials and industrial products into the South. Coordination between the two zones on matters of economy and administration was promised in the conference report.

More than a month after the conference closed, Lt. Gen. Hodge summarized its achievements, saying that the net results fell short of the aims expected of it by the United States representatives. The American desire to do all that was possible to eliminate the hardships created by the thirty-eighth parallel was curbed, he said, by the Soviet view that the conference should concern itself with a

limited number of the most urgent problems. The Soviet request for rice from the South was not unconditionally granted Lt. Gen. Hodge said, because the American zone had received 1,500,000 Korean refugees from Japan and North Korea. The inability of the Americans to guarantee shipments of rice resulted in a Soviet statement, the General said, that "they considered it expedient and necessary to exclude from the agenda questions of electric power, exchange of foodstuffs, raw materials, fuel, industrial equipment, and chemical products." In addition, no decisions were made on free circulation of newspapers throughout Korea, unification of the broadcasting system, a unified currency, and integrated telephone and telegraph communications. In the matter of displaced personnel, the conference agreed to permit citizens to return to their former homes in either zone. As the United States and the Soviet Union prepared for the second phase of their meetings to assist in the formation of a provisional Korean government, the political parties within the American zone made an unsuccessful attempt at unity in a political conference, in late January, sponsored by Kim Koo and his Korean Provisional Government party. A wide group of parties was invited to send representatives, including the "Big Five"—the Korean Democratic Party, the Nationalist Party, the New Korean Nationalist Party, the People's Party, and the Communist Party—but the Communist Party and the People's Party refused to join the meeting. When the conference submitted a list of names for the unification committee, in accordance with the Moscow Conference, the Communists refused to be included, and branded the list as unrepresentative. In February the Communist press reported the creation of the North Korea People's Government in the Soviet zone, with a platform that included "the positive extermination of pro-Japanese and anti-democratic" elements and the "strengthening of administrative organs of all districts by using powerful leaders in all departments." It further called for the requisitioning of land from big landlords for Government ownership, the abolition of the tenant-farmer system and the free distribution of land to farmers.

The list submitted to Lt. Gen. Hodge constituted the Representative Democratic Council of South Korea. Dr. Syngman Rhee, chairman of the group and former chairman of the Korean Commission in Washington, outlined the Council's program in a public statement to the nation. Strongly similar to the political and economic phases of the program in North Korea, Rhee's plan demanded confiscation of public and private property of all Japanese; nationalization of heavy industries, mines, forests, public utilities, banks, communications, and transportations; redistribution of all confiscated lands to the peasants on the basis of ability to work the land; redistribution of large estates with compensation to the owners and payment for the redistributed land made to the Government on a long-term basis, and state supervision of all commercial and industrial enterprises. In addition to a revised tax program, minimum wage laws, and socialized medicine, Dr. Rhee requested a planned economy for the rapid reconstruction of the country, with a suitable price control and rationing program.

The meeting of the joint United States-Soviet Commission for setting up an interim government opened optimistically on March 20 when both Lt. Gen. Hodge and Col. Gen. Terenty Shitykov, chief of the Soviet delegation, stressed their desires to see Korea move towards independence and democracy. As the meetings proceeded through April

and the early days of May none of the pertinent questions were resolved and the conference adjourned on May 8. The breakdown came about through discussions concerning the Korean political groups to be consulted in the establishment of an interim government; the United States delegation considered that all parties should be called in to participate, while the Soviet delegation refused to consult with those groups that had demonstrated against or expressed opposition to the decisions of the "Big Three" at Moscow.

After a five-day inspection tour of former Japanese war industries in the Soviet zone early in June, Edwin W. Pauley, United States Reparations Commissioner, reported that he had found the industrial establishments in that zone, for the most part, intact and had seen no evidence of large-scale removal of capital goods. Mr. Pauley's tour was carefully supervised and included examination of nine "targets" of the twenty-six his mission had scheduled for inspection. His inspection covered 60 percent of the industry in the north, including iron and steel, metal working, chemical, power, mines, mill and smelters, textiles, pulp, paper, and food. In two statements on June 4 and 17, Mr. Pauley said:

"Inasmuch as we had heard, in both the United States and Southern Korea, many rumors of substantial industrial equipment removals, I asked General I.M. Chistiakov the direct question as to whether there were removals, and, if so, what they consisted of. General Chistiakov stated there were no removals of industrial equipment of any kind to the Soviet Union. He added that it was a policy laid down by high Soviet officials that there would be no removals and the directions were given to him.

"The entire group because of these rumors and their desire to revive Korean industry for the benefit of the Koreans and the people of the Far East were particularly observant to see if there were evidence of such removals having taken place.

"Only on two or three occasions did we view anything that would indicate that such removals had taken place, and those only to a minor extent. One was in a railroad marshalling yard the first day out where we passed a train loaded with miscellaneous machine tools and two cars of heavy copper wire. This may have been going between points in Korea. The others were power substations, where we noticed the electrical and transformer equipment had been taken out or was packaged ready for shipment. This could well have been for intra-Korean movement."

Aside from the formal meeting between the United States and Soviet Union occupation chiefs, relations in Korea were far from being amicable. On February 21 General MacArthur's headquarters in Tokyo and Lt. Gen. Hodge in Seoul conditionally refused to give a Tass correspondent permission to visit the American zone in Korea. The order would be rescinded, Lt. Gen. Hodge said, when the same courtesies were extended American newspapermen desiring to visit the Soviet zone.

The Soviet consulate in Seoul closed its offices in June after a United States State Department message to Moscow demanded that a United States consulate be established at Heijo, capital of the Soviet occupation zone, or that the Soviet consul cease activities at Seoul.

The first decisive step toward placing responsibility on the Koreans for their own administration occurred on July 9 when Lt. Gen. Hodge announced his support of a proposal to establish a legislative body of Koreans to assist the Military Government in South Korea. Emphasizing that such a body would in no way be considered an initial move toward a separate Government for Southern Korea, Lt. Gen. Hodge said, "Such a Legislature could exist only as long as the Military Government exists in South Korea. When North and South Korea are unified under a Provisional Korean Democratic Government, the functions of this interim body would be taken over by the Pro-

visional Government and this body would cease to exist."

The reaction of the Communist party and other extreme leftist organizations to the plan, which had been intimated a week earlier by Maj. Gen. Archer L. Lerch, the Military Governor, was to reject flatly the proposal and refuse to participate in its duties, because, they asserted, it would serve only to perpetuate the Military Government.

The issue concerning the duration of the United States occupation was clarified by the State Department in Washington which announced that the American commander in Korea had been instructed to inform the Korean people that the United States would uphold its commitments and "stand by them until these commitments are fully achieved." The United States had no imperialistic aims in Korea, the announcement said, but troops would be maintained until the nation had reached unity, independence, and democracy. It upheld the right of self-determination and freedom of press, assembly, and speech. The objectives of the Military Government were listed to include economic improvements, liberal labor and land reforms, the establishment of a stable currency, the elimination of monopolies, the development of an educational system and the creation of a free judiciary and police.

The statement was followed by two radio broadcasts by Lt. Gen. Hodge in which he lashed out at anti-American individuals and groups who were allegedly sabotaging American efforts to assist Korea. Denouncing the "well-organized propaganda factories working in an all-out effort to discredit the American effort to help in rebuilding Korea," he said that none of these attempts would distract the United States from its avowed policy.

The remarks stimulated denials and a barrage of anti-American sentiment among the extreme leftists. A wave of strikes with demands for higher wages hit the railroads, and additional strikes were threatened in public utilities and printing plants.

Some effort to rehabilitate Korea's economy was seen in a United States loan of \$25,000,000 worth of surplus Army equipment, which Korea will repay with dollars earned from exports. The credit was issued for a thirty-year period at 2½ percent interest. Since the United States recognized no Korean Government, the equipment was transferred to the American Military Government, pending the establishment of a Government. Use of the equipment was limited to the American Zone.

Early in October the prospects for the establishment of an interim legislature for South Korea improved as leaders from both the Right and Left agreed on the formation of a coalition committee. Representation from the Right was complete, but the Left contributed only mild elements, with the Communists refusing to participate. The group, under the leadership of Kim Koo, proposed a body of ninety members, forty-five elected and forty-five chosen by Lt. Gen. Hodge from a list submitted by the coalition committee. The plan included the selection of two representatives from each village and district, who would elect two from representatives from each myun (larger district). In turn, these representatives would elect two from each county and this group would elect provincial representatives on the basis of population. Finally, the recommendations placed responsibility on the proposed legislative body for the enactment of a plan whereby it will replace itself with a legislature composed entirely of representatives of the Korean people chosen through direct universal suffrage.

This plan, which would give Koreans wide, but supervised, control of their Government was ap-

proved by the occupation authorities on October 15, which scheduled the first meeting for November 3. The Military Government retained the power to dissolve the Assembly, approve new members and require new elections. In elaborating on the Assembly's functions, Maj. Gen. Lerch said he would interfere in Assembly proceedings only if attempt were made to legislate the United States command out of Korea, place unfair responsibilities on the occupation forces, or endanger the Korean economy.

Large-scale rioting and strikes, resulting in the death of between thirty-eight and fifty Korean policemen and an undetermined number of civilians, broke out on October 5 in Taikyu, about 150 miles southeast of Seoul. Demonstrators cut the wire communications, preventing accurate reports, but military authorities asserted that the riots were directed against the local police, because they were the representatives of the occupation authorities. United States troops moved into the area and established martial law. When rioting spread from Taikyu to adjacent areas, United States authorities extended martial law to cover the whole of Kyongsang Pukto Province and moved in additional troops and a reinforcement of 1,100 policemen. United States authorities attributed the trouble to "political agitators," rather than labor difficulties. Sporadic rioting continued in the southernmost areas and several deaths occurred in an attack by 500 demonstrators on a police station at Masan. Another cause for the riots, according to some observers, was the fact that about one-fifth of the police force had worked for the Japanese and had employed roughness in seizing rice from the farmers in accordance with the Military Government's rationing program.

After martial law had been relaxed on October 10 to permit ten newspapers to resume publication, Lt. Gen. Hodge warned Koreans against further disorders and asked for their co-operation to prevent recurrences, which were being planned by "dangerous anarchists, criminals and agitators." Within a week sporadic rioting burst out in both the northern and southern sections of the United States occupation zone, with reports listing sixty dead, nearly 300 wounded, and about 750 arrests. The disorders appeared to have been inflamed by conditions surrounding the collection, distribution, and price of rice—the staple food that was a focal point for political controversy. All political parties indulged in promises which would provide more rice, higher wages, and wide freedom for their adherents. During the outbreaks, the headquarters of Lt. Gen. Hodge disclosed alleged documents supporting Military Government charges that the riots were Communist-inspired. The documents, reportedly confiscated from arrested Communist leaders, showed that the Communist party had supported the September railway strike, instigated the riots in South Korea, and planned to integrate the struggle "with the city people's fight for rice and the farmers' fight for land reform against the grain collection" system of the Military Government.

At the opening of the South Korean Legislature on December 12 about twenty members of the Rightist Han Koo Democratic party refused to attend the meeting in protest against the invalidation of elections in Seoul and Kangwan Province. New elections were ordered in these areas by Lt. Gen. Hodge because he thought that the original election preparations were inadequate.

During January the extreme right-wing political groups increased their complaints against the continuation of the United States occupation. After the

presentation of an open letter to the United Nations General Assembly on December 9 by Miss Louise Kim, delegate of the Representative Democratic Council of South Korea, which warned of possible civil war unless all foreign troops were withdrawn and Korea given independence, Acting United States Secretary of State Dean Acheson said that the United States intended to maintain its force until the unification of a free Korea could be achieved. A similar declaration of policy was given Syngman Rhee on his visit to Washington. Although Mr. Rhee said he "controlled" all parties and factions in southern Korea, State Department officials said that he had no official capacity.

**Production.** Reports of the Military Government indicate that economic recovery of South Korea has been limited by lack of technical skill, machinery, replacement parts, and shortages of raw materials. Scarcity of consumer goods, the serious food shortage (necessitating a program of rationing, price control, and importation of a substantial amount of food items from the United States) with a high degree of inflation, also have been serious factors in retarding economic recovery. As of May 31 there were in operation approximately 1,100 textile, chemical, food processing, and machinery factories, employing about 65,000 people, with a total production valued at about two million yen. Hydroelectric power, largely located in North Korea, has been highly developed; 1944 installed capacity was 1,500,000 kilowatts.

Despite the difficulties attendant upon economic activity, South Korea had available for export in August limited amounts of fish products, drugs, raw silk, and some minerals, including fluorite, pyrophyllite, manganese, mica, and graphite. About 71 percent of the people of all Korea were estimated to be engaged in agriculture. Rice, barley, sweet potatoes, and rye are major crops of South Korea. Production for 1946 was curtailed seriously by heavy floods in June and July. Livestock population in 1946 in South Korea was estimated at 484,000 cattle, 39,000 horses, 188,000 hogs, 5,000 sheep, 904,000 fowl.

**Foreign Trade.** As of the end of July, exports from South Korea totaled only 3,544 metric tons, while imports totaled 102,298 metric tons. Imports consisted primarily of items vital to the health and welfare of the population—food, clothing, fuel, fertilizer, essential machinery, and parts supplied as a part of the Military Government emergency supply program.

All foreign trade was put under Military Government control at the time of occupation. Korea's merchandise trade with Japan during the first 10 months of 1940 was: imports, 1,121,900,000 yen; exports, 614,100,000 yen. Merchandise trade with foreign countries during the first nine months of 1940 was: imports, 168,200,000 yen; exports, 150,700,000 yen. The chief exports are rice, fertilizer, sardine oil, crude copper containing gold and silver, raw silk, soybeans.

**Finance.** South Korea budget estimates for the fiscal year ending March 31, 1947, were set at expenditures of 11,800,000,000 yen and income of 8,013,000,000 yen, leaving a deficit of 3,787,000,000 yen. North Korea estimates are not available. For the entire country before the war, budget estimates for the fiscal year ending March 31, 1942, balanced at 1,012,577,000 yen. The yen exchanged at \$0.2344 in 1940 and 1941 and at \$0.0666 in 1946.

**Transportation.** Railways extended about 3,345 miles on January 1, 1941 (state lines, 2,469; private, 876). South Korea railways extended 1,679

miles on May 1, 1946 (standard gauge, 1,547; narrow gauge, 132). Roads extended 19,048 miles in 1940. Shipping entering the open ports in 1938 totaled 14,677,742 tons.

JOSEPH P. BLANK.

**KOREAN LITERATURE, ARTS, AND CRAFTS.** Korea was occupied during 1946 by the Soviet and American armies in their respective zones. Under difficult conditions, therefore, the Korean people attempted to regain freedom of cultural development after thirty-five years of exploitation and inhibition under the Japanese. Artistic and literary achievement during the year was subordinated to the practical struggle for political and social survival and to such activities as the creation of an educational system, the formulation of a modern vernacular style, and the preservation of national art treasures, museums and libraries.

**Literature.** Literary output was largely concerned with the political and social problems of the newly liberated country. Much of it has been journalistic. Over twenty newspapers were published in the capital, Seoul, many of them organs of political parties or ideological groups. Outstanding were the *Chosun Ilbo*, *Dong-a Ilbo* and *Chosun Imminbo*. Short stories, essays, editorials and commentaries, as well as news despatches filled their pages.

Popular histories, biographies, and historical fiction have been popular. A beginning was made in re-editing the literary classics of the country and in compiling native folk tales and songs.

Modern school texts appeared in the Korean language for the first time. Over three million new texts had been distributed in South Korea alone by August. The Korean Language Research Society, which had been working underground for several years, prepared language texts which employed a modernized horizontal form of the native alphabet invented in 1443 and widely recognized as an ideal phonetic medium. The Chindan Society, an historical association, edited texts in Korean history and the social sciences.

The Korean National Library, listing over 300,000 items, including many rare old Korean manuscripts and collections, was opened in Seoul in February.

**Arts and Crafts.** The transition from Japanese to Korean control did not result in damage to the ancient art of Korea owing to special precautions taken by the authorities. The National Museum in Seoul was opened on February 25 and the Kaesong Museum on April 15. Several art treasures dating from the Silla period (57 B.C. to 932 A.D.)—a gold tower-shaped dish, a gold nine-story tower, a crystal bowl and a porcelain vase—were returned to the National Museum. Similar steps were taken to preserve other national monuments.

Native crafts, for which Korea has long been famous, such as inlaid lacquer, brass ware, ceramics, basket-ware and matting, enamelling and chest-making, are being slowly revived. The Japanese had encouraged some of these crafts but since the products were usually distributed with Japanese labels they were not known as Korean. With the liberation of Korea the native crafts have been greatly stimulated and a beginning has been made for the recovery of Korea's reputation in the Far East for workmanship and artistic performance.

EVELYN B. McCUNE.

**KURE (Ocean).** An island in the Pacific located 56 miles northwest of Midway Islands. It is a coral reef having a circumference of 14.7 miles. By Exec-

utive Order the island was placed under the jurisdiction of the U.S. Navy Department as of February, 1936.

**KURILE ISLANDS (Chishima).** A chain of 47 islands reaching from the Japanese island of Hokkaido to the tip of the Kamchatka peninsula in the eastern Asiatic U.S.S.R. The most important islands are Kunashiri, Etorofu, Uruppu, Shimushiro, and Paramushiro. Total area: 3,944 square miles. Population: 5,000, exclusive of a large number of hunters and fishermen who enter the islands from the south during the summer. The islands were occupied by U.S.S.R. after the surrender of Japan in 1945. According to the text of a secret Yalta agreement (made public February 11, 1946) signed by the "Big Three" at Yalta on February 11, 1945, "The Kurile Islands shall be handed over to the Soviet Union."

**KUSAIE.** An island in the eastern Carolines of the Japanese Pacific Islands; under the control of the United States following the defeat of Japan in 1945. Area, 45 square miles. There is a fine harbor with large commercial piers. On November 6 Kusaie was included in the Pacific islands that the United States requested be placed under United Nations trusteeship with the United States as administering authority.

**KWANTUNG.** The territory occupying the southern part of the Liaotung peninsula in Manchuria, leased from China by Japan; surrendered by Japan in 1945 to Allied armed forces. During 1946 the territory was the scene of heavy fighting between Chinese Communists and Nationalists. Area, including 40 adjacent islands, 1,338 square miles. Population (census of October, 1940), 1,367,334. Chief towns (1938 populations): Dairen, 515,743; Port Arthur (Ryojun), 145,286; Pulantien; Kinchow. The chief industries are agriculture, fishing, and salt manufacture.

**LABOR, U.S. Department of.** A Department of the U.S. Government which in 1946 consisted of the following principal bureaus and divisions:

Bureau of Labor Statistics  
Division of Labor Standards  
National Wage Stabilization Board  
Retraining and Reemployment Administration  
Shipbuilding Stabilization Committee  
U.S. Conciliation Service  
U.S. Employment Service  
Wage Adjustment Board  
Wage and Hour and Public Contracts Divisions  
Women's Bureau

Secretary of Labor: Lewis B. Schwellenbach.  
See articles on CONSUMERS' COOPERATIVES; LIVING COSTS AND STANDARDS.

**LABOR CONDITIONS.** The year marked a continued relaxation of governmental control over labor relations and labor conditions during a period of reconversion to peacetime activities. It saw the passing of governmental control of wages and a general return to free collective bargaining. Shifts in employment from wartime to peacetime activities were substantial and the distribution of employed workers in large measure reflected pre-war patterns. Employment declines in war industries were offset by increases in employment in other industries, particularly in construction. Despite the large numbers of persons returning to civilian life from the armed forces, unemployment increased but slightly. At the end of the year, unemployment was estimated at 2,120,000. Basic wage rates and actual earnings increased substantially. Hours of

labor, on the other hand, decreased slightly. Serious strikes in several basic industries took place and the time loss due to strikes and the number of workers involved in such strikes were the greatest in any year in American history. In Canada wage stabilization controls were also dropped. There was likewise a substantial increase in the time loss due to and the number of men engaged in strikes. Great Britain continued wartime controls. In Britain, however, strikes declined in number and duration as well as in the number of persons involved.

**Employment and Unemployment.** In the United States changes in the composition of the labor force and significant shifts in the occupational distribution of employed workers marked the gradual restoration of pre-war occupational patterns. Millions of men left wartime pursuits such as military service or jobs in war production for peacetime activities. At the same time many women and girls left the labor force to return to household tasks or to school. Thus, the total labor force (including those in military service) dropped from 66.5 million in August 1945 to 60.3 million in December of 1946.

Swelled by the demobilization of the armed forces the civilian labor force increased by 4 million over V-J day to reach 58.4 million by December 1946. At that date 49,100,000 persons were engaged in non-agricultural employment and 7,210,000 in agriculture. Between August 1945 and August 1946 10.5 million servicemen returned to civilian life. Unemployment increased slightly with approximately 2,120,000 idle at the end of 1946.

Employment declines in shipbuilding, aircraft and transportation equipment (except automobiles) were more than offset by gains in employment in other industries such as lumber, furniture, textiles, and rubber, as well as in trade and service activities. Employment on construction increased from 1,064,900 in August of 1945 to 2,321,400 by August of 1946.

There were approximately 56,000 foreign workers in the country in 1946, all of whom were engaged in agricultural labor. Approximately 39,000 of these were Mexican laborers and slightly over 10,000 were Jamaicans.

ESTIMATES OF THE CIVILIAN LABOR FORCE, AGRICULTURAL AND NON-AGRICULTURAL EMPLOYMENT IN THE UNITED STATES IN OCTOBER 1943, 1944, 1945, 1946

(Millions of Persons 14 Years and Older)

In Canada the index of employment declined from 175.5 in June 1945 to 169.9 in June of 1946. Total employment in June of 1946 was 4,702,000 with 126,000 persons estimated as unemployed.

In Britain the total working population declined slightly to 20,322,000 in May of 1946 from the total mid-1945 figure of 21,569,000. The number of insured persons registered as unemployed in-

creased from 103,000 in mid-1945 to 376,000 in May 1946.

**Women Workers.** By one year after the war's end, although the civilian labor force increased by 5,650,000, the number of women in the civilian labor force decreased by 2,160,000. The percentage of women in the civilian labor force dropped from 36 percent in August 1945 to 29 percent in August 1946. Withdrawals of women from the labor force during this period were estimated at 3¼ million. The greatest concentration of these withdrawals was in the 20-34 age group, many of which were attributable to the rejoining of husbands returned from the services and to high marriage and birth rates. Nevertheless factories employed 620,000 more women than before the war and the number of unemployed women a year after the war's close had increased by only 600,000.

Women's average weekly earnings, as reported by the National Industrial Conference Board for 25 selected manufacturing industries, were \$34.86 for August 1946 as compared with \$32.49 in August 1945. Women's average hourly earnings for the same month were 90.4 cents as compared with 79.4 cents in August 1945, while women's average weekly hours for August 1946 decreased to 38.5 from 40.9 for August 1945.

Rhode Island passed an equal pay law prohibiting sex discrimination in payment of wages. Proposed Federal legislation requiring the payment of equal pay for equal work, was reported favorably by the respective labor committees of the House and Senate but was not debated before Congress adjourned.

**Child Labor.** The year following the close of the war showed a decline in the employment of child labor from its wartime peak. In April 1945, approximately three and one-half million children of ages from 14 through 17 were at work. By April 1946, the number of children in ages from 14 through 17 had declined to two and one-fourth million. The downward trend in high school enrollment ceased before V-J day and in 1946, high school enrollment began to increase. There were approximately 6,200,000 attending high school in the Fall of 1946, an increase of nearly 300,000 over 1945.

The trend toward the removal of wartime relaxation of child labor regulations continued. Georgia enacted a new child labor law which increases from 14 to 16 the minimum age for work at any time in mills, factories, laundries, manufacturing establishments and work shops. The law also establishes a 16-year minimum age for employment during school hours and a 14-year minimum for work outside school hours in any gainful occupation except that under certain conditions boys 12 and 13 may work outside school hours in wholesale or retail stores. A maximum 8-hour day, 40-hour week was set for minors under 16. California repealed the Minors' Emergency Employment Act and revoked all permits issued thereunder. Massachusetts passed a law regulating the hours and conditions of labor by minors on farms by specifying that no minor under 14 years of age shall be employed on a farm more than 4 hours a day, or 24 hours a week, except on a farm operated by a relative by law or marriage.

Inspections of establishments as to compliance with the child labor provisions of the Fair Labor Standards Act showed that, although the actual number of minors found illegally employed in the fiscal year ending June 30, 1946, was less than the number found in the year ending June 30, 1945 (9,538 as compared with 13,289), they amounted

to over a thousand more than the number (8,436) found in the war year ending June 30, 1944. Actually a higher proportion of the minors found employed by inspectors in 1946 were illegally employed than in 1945. In 1946, of the 79,588 minors in establishments inspected, 9,538 or 12 percent were illegally employed; in 1945, of the 137,102 minors employed, 13,289, or 9 percent, were illegally employed. In 1946 there was also an increase over 1945 in the proportion of the illegally employed minors who were under 14, and in the proportion of minors employed without the proper age certificate.

**Wages and Working Hours.** Basic wage rates in manufacturing rose 16 percent in the first years of peace. Between V-J day and May 1946, the wage rates of all American workers advanced on the average by about 11½ cents. During the same period, the wage rates of workers employed in manufacturing industries advanced about 14½ cents. In the trade and service industries the average wage rate increase was slightly under 3½ cents per hour. By November 1946 gross average hourly earnings had reached \$1.139, an average increase in hourly earnings of 15.1 percent over November of 1945. Average weekly earnings increased to \$45.74 in November, more than \$4.85 above the figure for September 1945, 97 percent above the January 1939 figure of \$23.19. Proposed amendments to the Fair Labor Standards Act providing for the raising of the legal minimum wage to 65¢ per hour failed of enactment by the Congress.

AVERAGE HOURS AND EARNINGS OF FACTORY WORKERS, SELECTED MONTHS, 1939-1946

Month and Year	Weekly Hours	Hourly Earnings	Weekly Earnings
January, 1939.....	36 7	\$0.632	\$23.19
January, 1940 .....	37 5	.655	24.56

Source U. S. Bureau of Labor Statistics.

Average weekly hours worked in the United States decreased slightly to 40.2 in November, as compared with 41.3 in November 1945.

In Canada, weekly earnings in manufacturing averaged \$31.67 in June of 1946 as compared with \$32.10 in the same month of 1945. Average hourly earnings for June of 1946 were \$.691 as compared with \$.703 in June of 1945. Average hours worked per week dropped to 42 in June 1946 from 44.3 in June of 1945.

In Britain, due to a decrease in overtime worked, weekly earnings declined in January of 1946 to 114s. 1d., a decrease of 11% since July of 1945. Average hourly earnings in January were identical with those of July 1945, 20s. 3d. Average hours worked declined from 47.4 in July of 1945 to 45.8 in January of 1946.

**Strikes.** In the United States the year 1946 saw serious strikes in many basic industries. Illustrative were the strikes in the automobile, steel, meat packing, electrical manufacturing, coal, railroads, farm-equipment, and the maritime industries. The number of strikes was greater than in 1945 and the number of workers involved and the number of man-days reached record highs. For the entire year the number of strikes was 4,700 as compared

with 4,600 in 1945 while the number of workers involved increased by 1,325,000 and the number of man-days lost increased more than three times.

Most of the strikes took place in the early part of 1946, and as in the latter part of 1945, were motivated by a desire to offset losses in hours worked, overtime and shift premium pay through the medium of substantial wage increases. In the largest strike on record the steel industry was virtually shut down in January 1946 by a strike of the United Steelworkers of America (CIO) involving some 750,000 workers and a demand for a wage increase of \$2.00 per day. Prior to the strike the United States Steel Corporation had refused to accept a proposal by President Truman that a wage increase of 18½ cents per hour be made the basis for settlement. In February, however, after the Government had re-examined its wage-price policy, an agreement was reached providing for a wage increase of 18½ cents per hour. The settlement was based on an average price increase of \$5.00 per ton announced simultaneously with the announcement of the adoption of a revised national wage-price policy.

The work stoppage in the automotive plants of the General Motors Corp., which began November, 1945, with a demand for a 30 percent wage increase and involved some 200,000 workers, members of United Automobile Workers (CIO), continued into 1946. In January a presidential fact-finding board recommended a wage increase of 19½ cents per hour or 17½ percent. The recommendation was rejected by the company. An agreement was finally reached in March providing for an increase of 18½ cents per hour, equalization of wage rates, improved vacation pay and overtime pay for work on the seventh day.

In January approximately 125,000 workers, members of the United Packinghouse Workers (CIO) and the Amalgamated Meat Cutters and Butcher Workmen of North America (AFL) began a strike affecting meat-packing establishments throughout the country. The companies involved in the strike were the five largest meat-packing firms—Armour and Co., Cudahy Packing Co., John H. Morrell and Co., Swift and Co., and Wilson and Co., as well as a number of smaller companies. The CIO Union demanded a wage increase of 25¢ per hour and the AFL asked for a minimum wage rate of \$36.00 per week with proportionate increases in rates above the minimum. On January 17 the Secretary of Labor appointed a fact-finding board to investigate the dispute and on January 24, with negotiations still unsuccessful, President Truman ordered the seizure of the strike-bound meat-packing plants by the Secretary of Agriculture. Almost immediately after the issuance of the seizure order the employees returned to work. In February the fact-finding board recommended a wage increase of 16¢ per hour which, after approval by the National Wage Stabilization Board was put into effect immediately by the Secretary of Agriculture. Subsequently, the seized plants were returned to their owners.

In the bituminous coal industry the United Mine Workers of America (AFL), struck on April 2 because of the failure of the mine operators to agree to a union proposal for the establishment of a security and welfare fund to be financed by a royalty of 10¢ per ton on all coal mined. The stoppage involved some 350,000 workers. The mines were seized by the Government on May 22 but the workers did not return to the mines until an agreement was signed on May 29 by the Secretary of the Interior and union representatives to

cover the period of Federal operations of the mines. The principal terms of the agreement called for a wage increase of 18½ cents an hour and a health and welfare fund to be financed by the payment of 5¢ per ton on all coal mined, the fund to be administered by three trustees, one selected by the union, one by the Coal Mines Administrator, and the third by the other two.

In May 1946 a stoppage of work by members of the Brotherhoods of Locomotive Engineers and Railroad Trainmen brought all major rail traffic to a standstill and resulted in the idleness of approximately 350,000 railroad employees. The two unions had rejected recommendations of an emergency board appointed under the Railway Labor Act and had submitted demands for a 25 percent gain in wage rates with a minimum increase of \$2.50 per day, as well as other adjustments, involving a total of 44 changes in working rules. The emergency board's recommendations, submitted to the President on April 18, called for wage adjustments for the trainmen and locomotive engineers of 16¢ an hour or \$1.28 per basic day and returned most of the union's demands for changes in the working rules to the parties for further negotiations. When negotiations failed the President, on May 17, issued an Executive Order seizing all major railroads. On May 23, leaders of the trainmen and engineers rejected a compromise proposal of the President for an 18½¢ an hour wage increase and withdrawal for one year of all requests for changes in working rules. On May 25 the President appeared before a joint session of Congress seeking emergency legislation giving him power to prevent future strikes, including authority to draft striking workers into the Army. Almost simultaneously with his appearance before Congress, the union officials signed an agreement incorporating the President's proposal and union members returned to work. On May 26 the railroads were returned to private control.

In Canada, as in the United States, there was a substantial increase over the year 1945 in the number of workers involved in strikes, as well as in the number of man-days lost due to strikes. For the first eight months of 1946 there were 165 strikes beginning during that period involving 124,774 workers, with a loss of 3,411,833 man-days.

In Great Britain, on the other hand, the number of strikes diminished as well as the number of workers involved in strikes and the number of man-days lost. For the first eight months of 1946 the number of strikes beginning in the period was 1498, with 369,800 workers involved in such strikes and a loss of 1,496,000 man-days.

**Collective Bargaining and Government Control** In the United States difficulties presented in the settlement of the steel and other strikes in January and February led to a modification of the National Wage Price Policy in February 1946. On February 14, President Truman issued an Executive order providing new criteria for the approval of wage or salary changes which looked toward price adjustments. Any wage or salary changes consistent with the general pattern of wage or salary changes established in the industry or local labor market area between August 18, 1945 and February 14, 1946 could under the terms of the order, be approved by the National Wage Stabilization Board. If no such general pattern existed, the Board was authorized to approve such increases as were necessary to eliminate gross inequities as between related industries, plants or job classifications or to correct substandards of living or disparities between the increase of wage or salary rates since

\* Preliminary, subject to revision. \* U. S. Bureau of Labor Statistics. <sup>b</sup> Canadian Labor Gazette. <sup>c</sup> British Ministry of Labor Gazette. <sup>d</sup> Through November of 1946.

January 1941 and the increases in the cost of living from that date to September 1945. The Board was empowered to fix special standards for the approval of wage or salary increases in other cases with the approval of the Stabilization Administrator. The Stabilization Administrator was empowered to specify classes of increases by regulation which might be made effective without prior approval of the Wage Stabilization Board and without waiver of rights to ask for price relief if, in the judgment of the Administrator, such classes of increases would have no unstabilizing consequences. The making of wage or salary increases without prior approval of the National Wage Stabilization Board constituted a waiver of any right to use such an increase as a basis for seeking higher prices.

On November 9, 1946, the President announced the removal of most controls on prices and the removal of all controls on wages.

In Great Britain, manpower controls under the Essential Work Orders which covered more than 8,000,000 workers at one period of the war were withdrawn from most industries and services with the exception of basic industries that might otherwise be critically short of manpower. By August of 1946 the number of workers still under the Essential Work Orders had been reduced to approximately 2,300,000.

Considerable controversy arose following a September decision of the London Passenger Transport Board to employ in the future in the grades covered by its agreement with the Transport and General Workers' Union only members of that union. Following a strike in 1937 by the London Transport Workers' Union, a group of dissatisfied workers who opposed the decision to return to work formed a dissident union. At the demand of the Transport and General Workers' Union who threatened to strike if the Board did not employ in the future only members of the TGWU, a decision was made by the Board to grant a closed shop to the union.

During 1946 the Trade Disputes and Trade Unions Act of 1927 was repealed. That Act was passed after the general strike of 1926 and prohibited a strike or lockout as illegal if (1) it had any object other than the furtherance of a trade dispute within the industry which the strikers were

engaged and, (2) was designed to coerce the government either directly or by inflicting hardship on the community. The Act also placed limitations on the rights of permanent civil servants to belong to trade unions and on the collection of political levies.

At the end of November Canada abandoned all wage controls.

In May 1946 the Iranian Council of Ministers adopted a decree assuring workers in the same factory or trade the right to form unions. Unions are required to register their articles of association and as a penalty for exceeding its rights or disturbing the public peace a union may be required to elect new officers or may be dissolved or suspended. Violence in connection with strikes is forbidden. Provision is made for compulsory arbitration of disputes by factory councils representing the workers, the employers and the Department of Labor. Strikes and lockouts are forbidden pending arbitration and violation of the law entails dismissal or the taking over of the plant by the government. All agreements reached are required to be put in writing. Hours of work are fixed at forty-eight a week, overtime to be paid at thirty-five percent above the regular rate, with regulation of the total amount of overtime to be permitted by the Department of Labor. There was also established a Department of Labor in the Ministry of Commerce and Industry with power to make safety and health regulations and to fix minimum wage rates which shall cover the living costs of a family. The granting of a weekly paid day of rest and a paid annual vacation is required as well as payment for six specified holidays.

**Labor Movements.** In 1946 in the United States, both the AFL and the CIO held conventions. The sixty-fifth convention of the AFL was held in Chicago from October 7 to 17th. The Federation reported a dues-paying membership of approximately 7,100,000. It adopted resolutions condemning communism, demanding termination of war-time wage controls and the existence of the National Wage Stabilization Board, urging increased social security benefits, and the enactment of health insurance legislation. Other resolutions condemned the World Federation of Trade Unions as a "reactionary development," established an AFL International Department, opposed the lowering of bars to immigration, and favored an increase in the minimum wage rate under the Fair Labor Standards Act. The Convention also advocated the establishment of a permanent Fair Employment Practices Commission, the establishment of a five-day, 30-hour week and the improvement of standards of workmen's compensation legislation.

The Congress of Industrial Organizations held its convention in Atlantic City in November 1946. The Congress passed resolutions "resenting and rejecting" communist efforts to interfere in union affairs, urging the end of stock piles of atomic bombs, demanding as imperative substantial wage increases, and denouncing the use of injunctions in labor-management disputes.

In manufacturing industries slightly over sixty-seven percent of all production wage earners were employed under union agreements by January 1946, compared with sixty-five percent at the beginning of 1945. In non-manufacturing industries the workers covered by union agreements at the beginning of 1946 constituted about thirty-four percent, an increase of about one percent as compared with January 1945. By January 1946 of about 29,000,000 workers engaged in occupations in which unions were organizing, some 13.8 mil-

lion workers in the United States were employed under written collective bargaining agreements. Although the total number of workers covered by collective agreements decreased slightly, the ratio of those covered by such agreements to the total number employed and eligible for coverage increased from forty-seven percent at the end of 1944 to forty-eight percent at the beginning of 1946.

The proportion employed under maintenance of membership clauses increased from twenty-seven percent at the beginning of 1945 to twenty-nine percent at the beginning of 1946. About thirty percent of the workers were employed under closed and union shop provisions compared to twenty-eight percent under such provisions at the beginning of 1945. Union shop clauses without hiring preference accounted for fifteen percent as compared to eighteen percent at the beginning of 1945.

In October 1946 the British Trades Union Congress held its seventh-eighth annual conference at Brighton, England. The Congress reported a membership of 6,671,120, a net increase for the year of 85,000. Resolutions were adopted demanding the establishment of a 40-hour week, favoring the severing of economic and diplomatic relations with Spain, endorsing the government's foreign policy but criticizing the denazification program in Germany and the deterioration of relations with the Soviet Union. The Conference also approved a statement of the General Council on the closed shop. The statement indicated that there was no exclusive right to organize by any one union where other unions had built up organization side by side. However, the statement emphasized that the Trades Union Congress would refuse to recognize so-called break away unions. The statement indicated that the Trades Union Congress is in favor of one hundred percent unionism in the sense of obtaining one hundred percent membership in a plant, but that no union is entitled to a closed shop against other bona fide unions having members in an industry.

The International Labor Organization held a Maritime Conference at Seattle, Washington, June 6 to June 29. Among the conventions adopted were conventions establishing a minimum monthly wage and maximum hours of work for seamen. Other conventions adopted covered food and catering for foods, the certification of ships' cooks, medical examination of seamen, crew accommodations on board ship, social security, the certification of able seamen and pensions for seamen.

In September the President announced the nomination of a representative of the American Federation of Labor as the labor representative at the twenty-ninth conference of the International Labor Organization to be held at Montreal, beginning on September 19. The CIO, thereupon, announced that it was severing all connections with the ILO and would not participate in the work of that organization. The Conference met as scheduled and approved a draft agreement defining the terms of the relationship of the ILO with the United Nations, adopted a budget of \$3,733,000 for 1947 operations, adopted an instrument for the amendment of the constitution and also adopted four conventions. The conventions adopted provided that children and young persons up to the age of eighteen working or employed in industrial and non-industrial occupations, must not be admitted to employment unless they have been found fit for work through medical examinations. In occupations involving high health risks, medical examination and re-examination would be required

until the age of 21. Other conventions restricted night work of children under the age of 14 and those over 14 subject to full time compulsory school attendance.

The Executive Bureau of the World Federation of Trade Unions met in Washington, D.C., September 20 to 24, 1946. The Iranian and Philippine Trade Unions were admitted to membership. The Bureau condemned the activities of the Greek Government with reference to trade unions and announced its support of Greek workers in their efforts to establish free trade unions. Resolutions condemning Spain and urging the establishment of a stable and lasting peace were adopted. The General Conference of the WFTU was held in Paris on December 10 to 12, 1946.

The Danish General Confederation of Labor met in Copenhagen in May 1946 and reported a membership of 604,319 at the end of 1945. The Conference adopted resolutions supporting the struggle of the Spanish people against Fascism, demanding the enlarging of the scope of collective agreements, urging the importation of increased amounts of raw materials and the planning of production for full employment.

The Norwegian General Confederation of Labor held a Congress at Oslo in May 1946, its first meeting since the liberation. Three hundred sixty delegates, representing some 370,000 workers, attended the Congress. Resolutions were adopted urging increased modernization of industry and the establishment of trades schools.

The twenty-sixth National Congress of the French General Confederation of Labor took place in Paris in April 1946. Over 1,000 delegates attended. A membership of five and a half million was reported, representing the total membership of some 16,000 unions. The Congress adopted a resolution calling on the constituent assembly to adopt bills relating to the nationalization of private banks and insurance, and the reform of the Bank of France, as well as resolutions urging protection of young workers and women and the adoption of social legislation.

The Economic and Social Council of the United Nations authorized the World Federation of Trade Unions and the American Federation of Labor to nominate representatives as observers at all public meetings of the Council. The request of the WFTU for full participation in the work of the Council was denied but consultative rights were granted.

**Federal Labor Legislation.** For the first time since 1943 legislation substantially modifying the national labor policy passed both Houses of the Congress, but a Presidential veto was sustained by the House and the so-called Case bill did not become law. That bill as passed by both Houses of Congress, provided for the establishment of a five-man Federal Mediation Board independent of, but housed within the Department of Labor, to which would be transferred the conciliation and mediation functions of the Department. The Mediation Board was authorized to proffer its services for the purpose of aiding in the settlement of labor disputes affecting commerce. Once the Federal Mediation Board had intervened, there would be imposed a 60-day waiting period during which strikes or lockouts would be prohibited unless mediation were concluded earlier.

The bill also provided for the creation of emergency commissions by the President in public utility disputes. In addition, the bill also contained provisions amending the so-called Anti-Racketeering Act, to remove exemption of certain labor un-

ion activity illustrated by the conduct found by the Supreme Court in *United States v. Local 807* not to be within the scope of that Act. In that case, members of the union met non-union trucks entering New York City and required the trucks to be turned over to union members to drive for part of the trip within the City. If non-union truck drivers refused to comply with this demand, the trucks were held up until union wages were paid to union members even though their services in driving the trucks were not accepted. The Court found that an exception in the Anti-Racketeering Act for payment of wages by a bona fide employer to a bona fide employee protected this type of conduct. In addition, the Case bill contained provisions restricting contributions to welfare funds to be administered solely by an employee representative, removing the protection of the National Labor Relations Act from supervisory employees, making unions and employers liable in suits brought in any United States court for violations of collective bargaining agreements, and making secondary boycotts violations of the anti-trust laws.

The section of the bill amending the Copeland Anti-Racketeering Act was later passed, however, as independent legislation.

During 1946 Congress enacted the so-called Anti-Petrillo Act, prohibiting certain practices in the broadcasting industry. The Act makes unlawful the use of force, violence, intimidation, duress or the threat of any other means to coerce, compel, or restrain (A) any radio licensee to (1) employ or agree to employ any person or persons in excess of the number of employees needed by such licensee to perform actual services, (2) to pay more than once for services performed or for services which are not to be performed, (3) refrain from broadcasting non-compensatory, non-commercial, education or cultural programs, or programs of foreign origin, or (B) (1) a licensee or any other person to pay tribute for using recordings, transcriptions, reproductions or any other materials used for broadcasting, or (2) to place restrictions on the manufacture and use of recordings and transcriptions for the purpose of preventing or limiting such materials for broadcasting. Violation of the provisions of the bill would result in criminal penalties. In *United States v. Petrillo* the United States District Court for the Northern District of Illinois held this statute unconstitutional.

In February 1946 Congress adopted the Employment Act of 1946. The Act established a declaration of policy to the effect that it is the responsibility of the Federal government to promote with the aid of industry, agriculture, labor and state and local governments, maximum employment, production and purchasing power. The President has the duty to formulate programs to carry out the purposes of the law. Provision was also made for the establishment of a three-man Council of Economic Advisers which is to assist and advise the President in the preparation of an Economic Report which is required to be transmitted to the Congress within sixty days after the beginning of each regular session. The Economic Report is to contain information on levels of employment, production and purchasing power obtaining in the United States, current and foreseeable trends in the levels of employment, production and purchasing power, a review of the economic program of the government and of the economic conditions affecting the government during the preceding year and a program for carrying out the declaration of policy, together with such recommendations for legislation as the President may deem necessary.

Proposed amendments to the Fair Labor Standards Act, raising the legal minimum wage from 40 to 65¢ an hour passed the Senate and a similar bill was favorably reported by the House Labor Committee but never reached a vote because of the failure of the House Rules Committee to grant a rule for its consideration. In *D. A. Schulte, Inc. v. Gangi*, the Supreme Court held that a good faith compromise settlement of a dispute over the coverage of the Fair Labor Standards Act is not a bar to a suit for liquidated damages. In *Anderson v. Mt. Clemens Pottery Co.*, the Court held that time spent by employees in walking to work on the employer's premises following the punching of time clocks was working time since such time was under the complete control of the employer and depended solely on the physical arrangements which the employer made in the factory. The Court also stated that preliminary activities after arrival at the place of work, such as the changing of clothes, the turning on of switches for lights and machinery and the like, constituted working time except where such activities were insubstantial and insignificant.

A rider to the Labor Federal-Security Appropriations Act, 1947, prohibited the National Labor Relations Board from using funds in cases involving employees engaged in agricultural labor, and stipulated that the definition of agricultural labor contained in the Fair Labor Standards Act should be used as the basis for determining the scope of the limitation imposed.

Veterans' re-employment rights were clarified by the Supreme Court in *Fishgold v. Sullivan Dry Dock and Repair Corp.* The Court rejected the so-called superseniority doctrine and held that the guarantee contained in the Act against discharge without cause within one year after a veteran's restoration to his peacetime job, does not protect the veteran against "lay-off" in accordance with the seniority system established by the union agreement in effect at the time of his induction.

Legislation to establish a Fair Employment Practice Commission was debated on the Senate floor but was withdrawn after a filibuster by opponents of the proposal. No further action was taken by the Congress prior to adjournment. Massachusetts, however, adopted an anti-discrimination law.

Referenda making closed shop contracts illegal, were adopted in Nebraska, South Dakota and Arizona.

WILLIAM M. LEISERSON.

**LABOR STANDARDS, Division of.** A Division of the U.S. Department of Labor, organized in 1934, authorized to develop desirable labor standards and to make specific recommendations to improve working conditions and the economic position of wage earners. Director in 1946: Verne A. Zimmer.

**LABOR STATISTICS, Bureau of.** A Bureau of the U.S. Department of Labor, established in 1913, charged with the duty of acquiring and diffusing information on subjects connected with labor. Information is issued in special bulletins and in the *Monthly Labor Review*. Commissioner: Ewan Clague.

**LACROSSE.** The return of a number of college and club teams to competition made for an interesting season in the Indian game. Navy, which shared the championship with Army in 1945, won the United States Intercollegiate Lacrosse Association crown outright, and placed three of its stars, Captain Ed Hanson, Lee Chambers and Jim Carrington on the All-America ten. The campaign, marked by a speeding up in offensive play, reached a fitting cli-

max on June 7, 1946 when the North and South All-Stars battled to a 14-14 tie after two extra periods at Baltimore.

Outstanding among the club teams was the Mount Washington L.C. Philadelphia carried off laurels in the women's national tournament, defeating Boston, Baltimore, New York and Westchester in a two-day tourney at Smith College.

THOMAS V. HANEY.

**LAND MANAGEMENT, Bureau of.** An office established on July 16, 1946, through the consolidation of the General Land Office and the Grazing Service, in accordance with the provisions of the President's Reorganization Plan III of 1946.

The scope of the Bureau includes: the survey, management, and disposition of the public lands and the resources therein; the administration of grazing on 153,000,000 acres of Federal range in ten western States; the maintenance of the only official cadastral engineering service; the adjudication of all claims to public lands; the issuance of land patents; the maintenance of 25 district land offices in the western part of the United States and Alaska and the responsibility for the care, handling, and final disposition of grazing and mineral lands in the continental United States under the Federal war-surplus disposal program. Director: Fred. W. Johnson (acting).

**LAND UTILIZATION, Office of.** An office of the U.S. Department of the Interior, created in 1940, which coordinates and integrates the land use and management activities of the Department. Assistant to the Secretary in charge of Land Utilization: Lee Muck.

**LATIN AMERICAN ART.** Contemporary art in Latin America has grown and progressively consolidated its standing in the years since the beginning of the second world war. Since 1939, most of the countries to the south have witnessed a revival of artistic activity and have cultivated the new art forms with greater interest. Thus there has been a trend toward complete liberation from the familiar patterns of the academies of the eighties which for so many years dominated Latin American art. Increasing attention has been given to the search for their own national artistic values at home and to the exchange of exhibitions and artists between countries.

First let us mention the 1946 international exhibitions of works of Latin American artists. Secondly we shall cite the exhibitions of interest held in the artists' own countries.

An event of special importance was the participation of many Latin American countries in the International Exhibition of Modern Art organized by the UNESCO in Paris, on view during November and December. *Argentina* presented works by Norah Borges, Héctor Basaldúa, Horacio Butler, Jorge Larco, Juan C. Castagnino, Emilio Centurión, Juan del Prete, Raúl Soldi and others. *Bolivia* was represented by Guzmán de Rojas. Among the many modern *Brazilian* painters included were Ibere Camargo, Jose Cardoso, Cicero Dias, Emiliano di Cavalcanti, Djanira, Tarcila, Percy Lau, Portinari and Lazar Segall. *Chile* offered works of Héctor Banderas, Marcos Bontá, Pablo Burchard, Héctor Cáceres, Camilo Mori, José Perotti and others. *Ecuador's* most youthful artists took part, among them Oswaldo Guayasamín, Eduardo Kingman, Bolívar Mena, Diógenes Paredes and Leonardo Tejada. José Sabogal, Julia Codesido and Mario Urteaga represented *Peru*. *Haiti* sent a collection

selected by *Le Centre d'Art*, including works of Louis Agenon, Leon Agnant, Maurice Borno, Hector Hyppolite, Antonio Joseph, Albert Mangones, Philome Obin, Geo Remponeau and Joseph Vincent. *Uruguay* displayed works of her well-known painters, Pedro Figari, Rafael Barradas, Joaquín Torres-García, José Cúneo and Amalia Nieto. *Venezuela* completed the Latin American group with works by J. B. Fabbiani, Héctor Poleo and Pedro León Castro.

The Ecuadorian painters Oswaldo Guayasamín, César Valencia and Alfredo Palacio, who took a group of their works to Peru in 1945, gave Argentina and Chile a chance to see their canvases, holding shows at the *Galería Peuser* in Buenos Aires in January, 1946 and in the salon of Santiago's *Banco de Chile* later in the year. Camilo Egas and Eduardo Kingman, also of Ecuador, were seen in one-man shows in the United States at the *Acquavella Galleries*, New York, and the *San Francisco Museum*, respectively.

Brazil's well known mural painter Candido Portinari exhibited during the summer at the *Gallerie Charpentier* in Paris. His countrymen di Cavalcanti and Noemia were seen in May at the *Hugo Gallery* in New York while Djanira was holding a one-man show at the *New School* and Vieira da Silva's works were on view at the *Willard Gallery*.

Among the Guatemalan artists exhibiting at the *Inter-American University* in Panama in February, 1946, were Humberto Caravito, Rodolfo Gálvez Suárez, Aguilar Chacón, Arimany and Tejeda, representing the academic tradition, and Carlos Mérida, Valentín Abascal, Mario Alvarado and Miguel Alzamora, on the modern side.

A comprehensive collection of Mexican painting ranging from the nineteenth century masters Velasco and Posada to such contemporary figures as Orozco, Rivera, Siqueiros and Tamayo went to Havana in May along with the Exposition of Mexican Books and a delegation of writers and musicians.

The art of Haiti has at last won attention outside of the island republic. Her "primitive" painters were the first to be shown abroad. Their fresh and ingenuous pictures were displayed at the *White Book Shop and Gallery* in Washington, D.C., in April and at the *American-British Art Center* in New York in June.

The American public had its first chance to see a large and representative collection of the work of the distinguished Uruguayan painter Pedro Figari (1861-1938) during the year. The show was inaugurated in April at the *Knoedler Art Galleries* in New York. The gallery and the *Council for Inter-American Cooperation* undertook to circulate the exhibit throughout the United States during 1946 and 1947. It was displayed at the *San Francisco Museum* in July and at the *Pan American Union* in Washington, D.C., in September. It represents the work of one of the most important pioneers of the new art in Uruguay.

Viña del Mar, attractive Chilean resort near Valparaíso, saw a large exhibition of Peruvian art during its celebration of Peruvian Week. The collection, arranged by the Lima Provincial Council, included anonymous colonial paintings, important works of the nineteenth century and an ample selection of contemporary works of such painters as Juan Barreto, Camilo Blas, Enrique Camino Brent, Alex Ciurlizza, Julia Codesido, Cristina Gálvez, Servulo Gutiérrez, Carlos Quispez Asín, José Sabogal, and Mario Urteaga. In return, a group of contemporary Chilean artists exhibited in the *Galería de Bellas Artes* of Lima in November.

#### THE PARIS PEACE CONFERENCE

Above: Gathering for lunch at the French Ministry of War are, left to right, Viacheslav M. Molotov, Georges Bidault, James F. Byrnes, and Ernest Bevin (European). Below: Bidault welcomes the 1,500 delegates of the twenty-one Allied nations that assembled for the Peace Conference at the Luxembourg Palace, Paris, on July 29, 1946 (Press Association, Inc.).

#### PEACE

Above: The Big Four Foreign Ministers with their advisers gather in the Hotel Waldorf-Astoria, New York, for the first session of the Peace Conference on European peace treaties, November 4, 1946 (Acme). Below: The United States delegation at the Paris Peace Conference: (left to right) James F. Byrnes, Secretary of State; Jefferson Caffery, Ambassador to France; William Clayton, Assistant Secretary of State; Ben Cohen, Special Assistant to the Secretary of State; W. B. Smith, Ambassador to the Soviet Union; Averell Harriman, the (then) Ambassador to Great Britain, and James Dunn, Ambassador to Italy (Press Association, Inc.).

Modern Cuban painting has been widely shown in other countries in recent years. July 1946 marked the end of the extensive tour of Cuban art organized by the *Museum of Modern Art* of New York City which included showings of the collection at many museums and galleries throughout the United States during a period of two years. The *Palacio de Bellas Artes* of Mexico City held an exhibit of Cuban art in June and a collection of works of eleven Cuban painters was seen at the *Museo Provincial de Bellas Artes* of La Plata, Argentina in July and at the *Dirección General de Cultura* in Buenos Aires in August. A group of modern Cuban paintings from collections in Washington, D.C., was displayed in December at the *Pan American Union*.

Artistic activities and progress within each country have been more vigorous and fruitful than ever before. It is not possible to list all the exhibitions held throughout the continent here. We must confine ourselves to pointing out some of the most important ones.

Argentina has continued her outstanding efforts in the field of fine arts publications which have given her the first rank as a producer of art books in the Spanish language. A great and ever-changing number of group and one-man shows is constantly being held in Argentina. The thirty-sixth National Salon was held in September and awarded top honors in painting to Ramón Gómez-Cornet and in sculpture to Luis Rovatti.

In Santiago, Chile, the *Instituto Chileno-Británico de Cultura* was the site of the Second Exhibition of Contemporary Chilean Painters. The catalogue listed works of Marcos Bontá, Pablo Burchard, Ramón de Zubiaurre, Olga Eastman, Héctor Cáceres, Carlos Ossandón and others. The *University of Chile*, in the same capital, sponsored an exhibition devoted to the so-called "generation of 1913," including paintings by Judith Alpi, Enrique Bertrix, Pedro Luna, and Carlos Isamitt.

*Le Centre d'Art* of Port-au-Prince, Haiti, celebrated its second anniversary in April with an exhibition of Luce Turnier, Maurice Borno and Raoul Dupoux. One of the members of the center, Geo Remponeau, won first prize in the Pan American Airways contest for decorating the airport at Port-au-Prince. This vigorous young institution continues to promote art in Haiti by constant exhibitions of national and foreign arts and now publishes a bulletin of Haitian art activities entitled *Studio No. 3*.

Cuba's modern painting shows a continuing upward trend in quality and strength. The *Lyceum* in Havana is the focus of activity of the new artists in Cuba and the scene of most of their group and one-man shows. After several years without any government sponsored exhibits the Third National Exhibition was held at the National Capitol in March, 1946. Prizes were awarded to Carlos Enriquez and Teodoro Ramos Blanco. At the same time, in the hall of the *Asociación de Reporteros* of Havana there was an unusual display of paintings by inmates of the Mazorra Hospital for the Insane. This showed the results of the first time that plastic arts had been used in Cuba as a therapeutic aid for the mentally ill. This interesting experiment was directed by the psychiatrist Dr. Manuel de Armas Pacheco, himself a painter.

In the Dominican Republic the Biennial Exhibition of Fine Arts was opened in April. First prizes were awarded to the painter Darío Suro and the sculptor Manolo Pascual. The *Galería Nacional de Bellas Artes* in Ciudad Trujillo held one-man shows during the year of the artists Ernesto Scott, L. J.

Alvarez del Monte and Darío Suro. From time to time the Cultural Relations Bureau of the government organized traveling exhibitions to be shown in cities and towns of the interior.

At the *Palacio de Bellas Artes* in Mexico City an extensive and revealing exhibition of Pre-Columbian Art of Western Mexico was held early in the year. A remarkable group of pieces borrowed from various museums and many private collections in the country were shown. Another show at the *Palacio* was the Exhibition of Plastic Arts organized by the Ministry of Education in August, in which 450 artists displayed 495 works of painting, sculpture, drawing, engraving, and architecture. The nation's highest cultural award, the *Gran Premio Nacional* went to the well known artist José Clemente Orozco for his painting and his extensive mural work carried on since the early 1920's. The first prize in sculpture was awarded to Luis O. Monasterio and Leopoldo Méndez took top honors in engraving. The *Society of Modern Art* in Mexico City continued its series of important and well planned exhibitions with one in December entitled "Mexico Seen by Her Painters," including a variety of landscapes and scenes of town and country of the 18th to 20th centuries.

In Caracas, Venezuela, the Seventh Annual Salon of Venezuelan Art opened at the *Museo de Bellas Artes* in March. Rafael Ramón González took the first prize in painting and Fernando Valero that in sculpture. The well known painter Héctor Poleo held a one-man show at the *Museo Nacional* in Caracas in the spring, and all the works shown were sold at the opening. Another successful individual exhibition was held in the same place by the progressive painter Pedro León Castro.

An exhibition of Peruvian popular arts was held at the *Museo de Cultura* in Lima in November. Contemporary handicrafts from all parts of the country were displayed, including textiles, pottery, and the unusual *mates burilados* (carved and painted gourds).

Quito, Ecuador, witnessed the Second National Salon of Fine Arts in May. The first prizes went to the painter José E. Guerrero and César Bravomalo, sculptor.

Finally, to turn to Guatemala, we note that a very important step for contemporary art in that country has been taken with the formation of the AGEAR (Association of Revolutionary Guatemalan Writers and Artists). This organization is devoted to the vinculation of cultural activities with the working class. In November it offered, at the headquarters of the Guatemalan Workers' Confederation in Guatemala City, a large show of contemporary art, with works of Valentín Abascal, Mario Alvarado, Miguel Alzamora, and Rodolfo Galeotti Torres. Galeotti Torres also held an individual exhibition of sculpture in October and, together with Alvarado, he has edited an illustrated *Index of Guatemalan Painting and Sculpture*, in Spanish and English, which is the first comprehensive publication in the field to date.

JOSÉ GÓMEZ SICRE.

**LATIN AMERICAN LITERATURE.** The year 1946 was saddened by the deaths of three great literary figures, Antonio Caso of Mexico, Pedro Henríquez Ureña of the Dominican Republic, and Alcides Arguedas of Bolivia. Caso devoted his life to the study and teaching of philosophy. A dynamic and brilliant lecturer, he opposed the positivism of Porfirio Díaz's *científicos*, and he became one of the greatest influences on Mexican philosophical thinking in this century.

Pedro Henríquez Ureña, though born in Santo Domingo, spent most of his adult life abroad, principally in Mexico and Argentina. He was one of the founders of the Mexican Ateneo and, as teacher and editor, became one of the leading figures in Mexican intellectual life. In 1924 he went to Argentina, where he became Director of the Instituto de Filología de Buenos Aires, a position which he occupied until his death. His life combined to the highest degree the talents of writer and teacher. As a philologist, he ranks with Bello and Cuervo, and his studies of Spanish versification are landmarks in their field. He made notable contributions to the study of American Spanish and to literary and historical criticism. As a tireless and inspiring teacher and guide to two generations of writers and intellectuals, his death is mourned throughout Spanish America.

Alcides Arguedas was Bolivia's greatest novelist. A journalist, sociologist, historian and diplomat, he made himself the most outspoken champion of the Indian with his *Wuatu-Wuaru*, 1904, *Pueblo enfermo*, 1909, *Vida criolla*, 1912, and his most celebrated work, *Raza de bronce*, 1919.

Five English translations and one original work about Latin America are worthy of special mention. Gilberto Freyre's *Casa grande e senzala*, translated by Samuel Putnam with the English title, *The Masters and the Slaves*, is a searching analysis of Brazilian society, and one of the most important sociological studies in Latin America. *The Rest Is Silence*, by the young Brazilian novelist, Erico Verissimo, is a psychological work of the first importance, describing the effect of a young girl's death on each of a number of witnesses. *The House of Mist* is a translation of *La última niebla* by the talented young Chilean, María Luisa Bombal, whose impressionistic and highly stylized novels have won her a continental fame. In *Secret Country*, Muna Lee translates thirty poems of the Ecuadorian poet, Jorge Carrera Andrade. Here is a great poet translated with perfect understanding and with a poetic skill that matches that of the original. *Caribbean Sea of the World*, a translation of *Biografía del Caribe* by the Colombian scholar and critic, Germán Arciniegas, is a brilliant recreation of four centuries of Caribbean history. And in *The Epic of Latin America*, Professor John Crow gives us a broad and imaginative introduction to Latin-American history and civilization.

**Argentina.** Among the outstanding books of poetry are Mario Luis Descotte's *La vida entre los dedos*; Olga Orozco's *Desde lejos*; Miguel Etchebarne's *Lejanía*, awarded the Buenos Aires Municipal Prize; César Rosales' *Después del olvido*; and *Espacios métricos*, a new volume by Silvina Ocampo, one of Latin America's finest poets.

In prose non-fiction, there are Héctor Agosti's *José Ingenieros*, a biography of the great philosopher and publicist; Vicente Barbieri's provincial memoirs, *El río distante*; Ibsen y su tiempo, by the gifted critic, Enrique Anderson Imbert; Leónidas Barletta's poetic narrative of sea life, *El barco en la botella*; León Dujovne's *Psicología y filosofía de la persona*; Ricardo Piccirilli's biography of Rivadavia, Argentina's first President; Luis Franco's *El otro Rosas*, a new slant on the nineteenth-century tyrant; Pablo Rojas Paz's life of the statesman, Alberdi; *Testimonios*, *Tercera serie*, critical and biographical sketches by Victoria Ocampo, publisher of *Sur* and one of the most remarkable cultural forces in South America.

In fiction, there are five notable novels: Alejandro Magrasi's *La Caá Yari*; Juan Goyanarte's *Lago argentino*; Max Dickmann's *Esta generación per-*

*dida*; and Roger Plá's *Los Robinsones*. Alberto Menasché's *Historia de gatos y otros cuentos* are sly and witty tales of animal foibles. Enrique Anderson Imbert has collected fantastic tales and essays in *Las pruebas del caos*. Also worthy of note are Carmelo Bonet's *Apuntaciones sobre el arte de juzgar*; Gerardo Pisarello's *Che rhetá*; Diego Newbery's *La vida es secreta*; Fausto Burgos' *El salario*; Carlos Ernesto Deheza's *Manuel D. Pizarro*, Nalé Roxlo's *El pacto de Cristina* and *El cuervo del arca*, imaginative and poetic plays.

**Bolivia.** The late Ignacio Prudencio Bustillo was a brilliant essayist and stylist. *Páginas dispersas* is a collection from his work, made by Bolivia's leading critic, Carlos Medinaceli. Raúl Botelho Gosálvez's *Altiplano*, a novel of Indian life, was the Bolivian entry in the first Latin-American Prize Novel contest. *El cristo viviente* is a meditation on the words of Jesus by the celebrated novelist and historian, Augusto Guzmán. *Metal del diablo* is a powerful novel about a tin magnate, by Augusto Céspedes. José Federico Delos *De pie*, a volume of political satire in verse, published clandestinely under the Villarroel dictatorship, is credited with no small part in bringing this dictatorship to an end.

**Brazil.** Excellent guides to Brazilian philosophy and culture are Cruz Costa's *A filosofia no Brasil*, Theodoro Ribeiro Junior's *Origens da literatura* and Fernando Azevedo's *Cultura brasileira*. *Novos estudos afro-brasileiros* is by the noted ethnographer, Gilberto Freyre. Of first importance is the biography of Luiz Carlos Prestes, the Communist leader, by Jorge Amado Octavio Tarquino de Sousa's *José Bonifácio, Emancipador do Brasil*, is a definitive biography of the statesman, naturalist, and teacher who helped to create the Brazilian Empire in 1822.

Two collections of short stories that reveal promising talents are Bruno Accioly's *João Urso* and De Sousa Junior's *Castillo dos fantasmas*. There are four noteworthy novels: Amadeu de Queiroz's grimly realistic *João*; Manoelito de Ornela's *Tiarajú*, the prose epic of a legendary patriot of Rio Grande do Sul; José Geraldo Vieira's *A mulher que fugiu de Sodoma*, a reprint of an outstanding realistic novel; and Maria Luiza Cordeiro's *Um olhar para a vida*, a prize-winning first novel of great psychological subtlety.

Anthologies of three of Brazil's major poets have been edited this year: *Obras completas de Castro Alves*, *Obras poéticas de Gonçalves Dias*, and *Obras Completas de Tomás Antonio Gonzaga*. Among new poetic works are Aurora Nunes Wagner's *Preludios* and Gastão Justa's *Quando as rosas florescem*. Povina Cavalcanti's *Ausência da poesia* is an enquiry into contemporary poetic values.

**Chile.** The Premio Nacional de Literatura, awarded last year to the poet, Pablo Neruda, was given this year to the novelist, Eduardo Barrios, whose early psychological novels, *El niño que enloqueció de amor*, 1915, *Un perdido*, 1917, *El hermano asno*, 1922, place him among the greatest stylists and most subtle writers of America. The Premio Atenea was awarded to Marta Villanueva de Bulnes (Luz de Viana) for her first novel, *No sirve la luna blanca*. The Concurso literario de Santiago gave its poetry prize to Jerónimo Lagos Lisboa's *La pequeña lumbre*, and its fiction prize to Jacobo Danke's *La taberna del perro que llora*, a volume of eight fantastic tales.

Among other notable books of poetry are Pedro Prado's *No más que una rosa*, Mila Oyarzún's *Estancias de soledad*, Juan Negro's *Vasto ser*, and the authorized *Antología* of the poetry of Gabriela Mistral, published by Zig-Zag.

Marta Brunet's *Humo hacia el sur* is a grimly realistic novel of life in a town in southern Chile. Two excellent volumes of short stories are Gonzalo Drago's *Una casa junto al río* and *Cristián y yo*, a selection from the works of Augusto D'Halmar, one of the great writers of Chilean fiction.

**Colombia.** Julio Flórez's *Poesías* is a selection from the poems of a gifted and beloved poet who died in 1923. In *Estudios hispanoamericanos*, Carlos García Prada, distinguished Colombian critic and Professor in the University of Washington, has gathered critical studies of poets and prose writers. Germán Arciniegas, in *Este pueblo de América*, has written an imaginative and illuminating account of the role of the common man in Spanish-American history.

**Cuba.** The Cuadernos de Cultura has published *Poesías completas* of Julián del Casal (1863-1893), the great Cuban precursor of modernism. *Trincherras de papel* is a reprint of newspaper articles by José Martí, whose literary fame is over-shadowed only by his grandeur as patriot and martyr. César Rodríguez Expósito's *Entre libros* contains a selection of the author's book reviews. Alejo Carpentier's *La música en Cuba* is a welcome addition to our scanty information about Cuban and Latin-American music.

**Dominican Republic.** *Panorama histórico de la literatura dominicana* is an authoritative work by Max Henríquez Ureña, brother of the late Pedro Henríquez Ureña.

**Ecuador.** Neptalí Zúñiga's *Atahualpa o la tragedia de Amerindia* is a profoundly moving biography of the last Inca and of his people.

**Guatemala.** There are three noteworthy volumes by young poets: Roberto Girón Lemus' *Orígenes*, Miguel Ángel Vázquez's *Relieves en el sueño*, and Enrique Juárez Toledo's *Pueblo y poesía*. Manuel Galich's *El canceller Cadejo: Teatro grotesco* is a satiric farce directed against the recent Guatemalan dictatorship.

**Honduras.** Rafael Heliodoro Valle, the distinguished poet and bibliographer, has published *Santiago en América*, a beautifully written account of the influence of St. James, the patron Saint of Spain, upon the geographical nomenclature of Spanish America.

**Mexico.** The Premio Lanz Duret, for the outstanding novel of the year, was awarded to Gustavo Rueda Medina's *Las islas también son nuestras*, a gently ironic story of tedium and love on a tropic isle. In 1945 this award went to Jesús Goytortúa's *Pensativa*, and this year Sr. Goytortúa was again honored when his *Lluvia roja* won the novel award of the Premio Ciudad de México. The non-fiction award went to *Nueva grandeza mexicana*, in which the poet Salvador Novo unfolds the glories and excitements of the capital city to a visitor from Monterrey. The Letras de México prize for El libro del año went to Andrés Bello for his *Martí, escritor*, a work of brilliant and searching scholarship that analyzes the writings of Cuba's Apostle of Liberty.

Among the notable volumes of poetry are Alfonso Reyes' *Romances (y afines)*, an added proof of the versatility of Mexico's foremost scholar and critic; Margarita Paz Paredes' *Voz de la tierra; Segundo despertar y otros poemas*, a new volume by Enrique González Martínez, Mexico's greatest living poet; *Cuando zarpe el barco*, a long prose poem on the lure of the sea by a talented young poet, Wilberto Cantón; and three excellent anthologies, Francisco González Guerrero's *Sonetos mexicanos*, González Ramírez and Torres Ortega's *Poetas de México*. *Antología de la poesía contemporánea*

*mexicana*, and *Sonrisa del alba*, poems by younger poets, chosen from the poetry magazines.

Francisco Monterde's *Moctezuma, el de la silla de oro* is a beautifully drawn portrait of the great Aztec Emperor. Antonio Magaña Esquivel has written a definitive biography of a leader of Mexican Independence in Guerrero, *el héroe del Sur*. In *Herefías y supersticiones de la Nueva España*, Julio Jiménez Rueda makes an acute and stimulating study of the heterodoxies of colonial times. *Cuaremas del Duque Job y otros artículos* is an edition of the prose of Manuel Gutiérrez Nájera. Of prime importance, literary as well as artistic, is the *Autobiografía* of José Clemente Orozco. Two collections of essays by Alfonso Reyes, *Simpatías y deferencias* and *Capítulos de literatura española (2a serie)* reflect the breadth of interests of one of the foremost scholars of the century.

Two of Mexico's most famous novelists have published books this year. Mariano Azuela's *La mujer domada* is the story of an ambitious woman's attempt to win literary fame; José Rubén Romero's *Rosenda* is a love story, simple, poignant, and one of his finest achievements. There are two noteworthy volumes of short stories: Arqueles Vela's *Cuentos del día y de la noche* and Ignacio Medina's *Remanso de historias*. José Mancisidor has made excellent choices in his two anthologies of the short story, *Cuentos mexicanos del siglo XIX* and *Cuentos mexicanos de autores contemporáneos*.

Among published plays of first importance are Agustín Lazo's *Segundo imperio*, about the Empress Carlota; Ermilo Abreu Gómez's *Un loro y tres golondrinas*, a farce with tragic overtones; and Bernardo Ortiz de Montellano's puppet-play, *El sombrero*.

**Nicaragua.** Ernesto Mejía Sánchez's *Romances y corridos nicaraguenses* is a comprehensive selection of popular ballads and songs.

**Panama.** Enrique Ruiz Vernacci's *Introducción al cuento panameño* is an exciting summary of the work of a vigorous new group of short-story writers.

**Peru.** Alberto Ureta's *Antología poética* is a collection of his poetry from 1911 on. Luis Alberto Sánchez's *¿Existe América Latina?* is a study of problems and responsibilities by an unfailingly stimulating thinker.

**Puerto Rico.** Pedro Juan Labarthe has harvested a much neglected field of literature in his *Antología de poetas contemporáneos de Puerto Rico*.

**El Salvador.** *Romances de Norte y Sur* is a collection of poems by Claudia Lars, a poet of first rank in Spanish America. In *Mi América*, Alicia Lardé de Venturino writes a poetic, dreamlike account of American travels.

**Uruguay.** Three volumes of poetry stand out: Clara Silva's *La caballera oscura*, simple, lyric verse by a new poet; *Acordeón marino*, a sequence of melodious, imaginative poems of the sea by Gastón Figueira, the outstanding poet, critic, and bibliographer; *Canto de mar*, the best poem of Carlos Rodríguez Pintos, whom Figueira considers the finest contemporary poet of Uruguay.

Daniel Muñoz's *Artículos* evokes the literary atmosphere of Montevideo at the turn of the century. Justino Zavala Muñoz's *Batlle, héroe civil* is a biography of José Batlle Ordóñez, the great democratic leader and president of Uruguay. *Pola Salavarieta* is a tragedy in verse, about a revolutionary patriot, written by the distinguished poet, Sarah Bollo.

**Venezuela.** Three excellent volumes of lyric poetry are *Libro de los sonetos* and *Prisión terrena* by Juan Berroes and *Al norte de la sangre* by Ana Enríqueta Teran. In *Este nuevo mundo*, Otto D'Sola

has collected his poems of national and international concern.

Among noteworthy collections of short stories are Ada Pérez Guevara's *Pelusa y otros cuentos*, Francisco Andrade Alvarez's *Claroscuro*, and Andrés Mariño Palacio's *El límite del hastío*.

DONALD D. WALSH.

**LATTER-DAY SAINTS, Church of Jesus Christ of.** A religious body, commonly known as the Mormon Church, organized in 1830 at Fayette, New York, by Joseph Smith. In 1945 the organization included 158 stakes, 1,215 wards, 118 independent branches, and 38 missions, with a membership of 979,454. Accurate information regarding the missions in Europe, and the Pacific, has not been available for the past three years. However, at the present time there are 2,000 missionaries, 300 in foreign fields. The administrative affairs of the church and the performance of all church ordinances are attended to by the priesthood, consisting of the Melchizedek Priesthood, a senior order with 122,547 male members, and the Aaronic Priesthood, a junior order with 104,987 male members.

The church maintains eight temples which are devoted to sacred ordinances for the living and the dead, such as baptisms, endowments, and marriages. It also maintains the Brigham Young University, Ricks Junior College, Latter-day Saints Business College, Juarez Academy in Mexico, and 12 collegiate institutes. The auxiliary bodies include the Women's Relief Society, numbering, in 1945, 102,610 members who care for the sick and the needy. The Sunday Schools, in 1945, had an enrollment of 360,332. The two Mutual Improvement Associations, composed of young people, had an enrollment of 117,805. The Primary Association for those under 12 had 127,960.

The Church holds, in Salt Lake City, Utah, two general conferences each year, one during the first week in April, and the other the first week in October, at which the work of the general authorities is reviewed. The general authorities, as sustained at the 1945 October general conference were: First Presidency: George Albert Smith, President; J. Reuben Clark, First Counselor; David O. McKay, Second Counselor. Quorum of the Twelve Apostles: George F. Richards, President.

**LAW.** This review is limited to important developments during the year, 1946, in judicial decisions, legal procedure, and jurisprudence. For discussion of legislation and similar topics, the special title involved should be consulted.

**War and International Law Decisions.** Two trials dramatically highlighted the evolving conceptions of the nature of war: the Nuremberg War Criminals Trial of the Nazi leaders and the American military commission trial of Japanese General Tomoyuki Yamashita. The agreement and charter for setting up the Nuremberg tribunal were executed in London, August 8, 1945 between Great Britain, the United States, France and the Soviet Union; in all, nineteen signatories of the United Nations expressed adherence to the agreement. See (1945) 13 U.S. Dept. of State Bulletin 222; *New York Times*, October 1, 1946, p. 12. The formal offenses with which the German military and political leaders were charged at the trial which began November 20, 1945 were: (1) Crimes Against Peace; (2) War Crimes; (3) Crimes Against Humanity; and (4) Conspiracy to commit acts constituting the foregoing crimes. The trial was concluded August 31, 1946; judgment of conviction carrying death

and imprisonment sentences for most of the defendants and acquittal for the others was rendered September 30 and October 1, 1946. See *New York Times*, October 1, p. 12; October 2, pp. 22, 23. The basic principle of law, formulated and vindicated at the trial, was that aggressive war is a crime against humanity. For discussion, see Gleuck, *The Nuremberg Trial and Aggressive War*, 59 *Harv. L. Rev.* 396; Robert H. Jackson, *The Case Against the Nazi War Criminals* (1946) (book includes Jackson's Opening Statement for the United States; agreement of the Big Four for prosecution and punishment of the major war criminals of the European Axis; text of the indictment). In the case of General Yamashita the question pertained to the law of war: whether this law imposes on an army commander a duty to control troops under his command for the prevention of atrocities. General Yamashita was the Commanding General of the Fourteenth Army Group of the Imperial Japanese Army in the Philippine Islands between October 9, 1944 and September 2, 1945; on September 3, 1945 he surrendered to the American military. Shortly thereafter on the order of the American commander, General Styer, a military commission was appointed to try General Yamashita on the formal charge that he "unlawfully disregarded and failed to discharge his duty as commander to control the operations of the members of his command, permitting them to commit brutal atrocities and other high crimes against people of the United States and of its allies and dependencies, particularly the Philippines; and he . . . thereby violated the laws of war." Six army officers, all lawyers, were appointed as defense counsel. At the conclusion on December 7, 1945 of a lengthy trial at which the commission heard two hundred and eighty-six witnesses, who gave over three thousand pages of testimony, General Yamashita was found guilty as charged and sentenced to death by hanging. His counsel then applied to the Supreme Court of the Commonwealth of the Philippines for writs of habeas corpus and prohibition. From an order denying the application his counsel petitioned the United States Supreme Court for review on certiorari, and also moved the latter court for leave to file with it an original petition for writs of habeas corpus and prohibition. In denying these petitions the Court, through Chief Justice Stone, overruled the following four contentions: (a) "that no military commission to try petitioner for violations of the law of war could lawfully be convened after the cessation of hostilities between the armed forces of the United States and Japan; (b) that the charge preferred against petitioner fails to charge him with a violation of the law of war; (c) that the commission was without authority and jurisdiction to try and convict petitioner because the order governing the procedure of the commission permitted the admission in evidence of depositions, affidavits and hearsay and opinion evidence, and because the commission's rulings admitting such evidence were in violation of the 25th and 38th Articles of War (10 U.S.C. §§ 1496, 1509) and the Geneva Convention (47 Stat. 2021), and deprived petitioner of a fair trial in violation of the due process clause of the Fifth Amendment; (d) that the commission was without authority and jurisdiction in the premises because of the failure to give advance notice of petitioner's trial to the neutral power [Switzerland] representing the interests of Japan as a belligerent as required by Article 60 of the Geneva Convention." Elaborate dissents were filed by Justices Murphy and Rutledge. Agreeing with the Court that the military commission was

lawfully created and had the power to try petitioner for a recognized war crime, Justice Murphy could not agree that the charge against petitioner stated a recognized violation of the laws of war. And he further contended that a military, just as any other federal trial was subject to the safeguards of the due process clause of the Fifth Amendment: in other words that the authority for the military trial which grows out of the exercise of the power conferred upon Congress by Article I, § 8, Cl. 10 of the Constitution to "define and punish . . . Offenses against the Law of Nations . . ." was limited by the Fifth Amendment. Eloquently he declares: "The immutable rights of the individual, including those secured by the due process clause of the Fifth Amendment, belong not alone to the members of those nations that excel on the battlefield or that subscribe to the democratic ideology. They belong to every person in the world, victor or vanquished, whatever may be his race, color or beliefs. They rise above any status of belligerency or outlawry. They survive any popular passion or frenzy of the moment. No court or legislature or executive, nor even the mightiest army in the world, can ever destroy them. Such is the universal and indestructible nature of the rights which the due process clause of the Fifth Amendment recognizes and protects when life or liberty is threatened by virtue of the authority of the United States." And Justice Rutledge concludes his dissent by quoting the great patriot Tom Paine: "He that would make his own liberty secure must guard even his enemy from oppression; for if he violates this duty he establishes a precedent that will reach himself." *Application of Yamashita*, 327 U.S. 1, noted in 40 Ill. L. Rev. 546, 37 J. Crim. L. 58, 44 Mich. L. Rev. 855, 21 Notre Dame L. 237. See also *Application of Homma*, 66 S. Ct. 515, ruled by the *Yamashita* case since similar issues were involved relative to the military trial of General Homma, the victorious commander of the Japanese Army in the Philippines from December 12, 1941 to August 5, 1942.

Historic issues of the nature of martial law and the suspension of civil trials were presented in two cases arising in Hawaii. Immediately following the Japanese attack on Pearl Harbor the Governor of Hawaii on December 7, 1941 placed the Territory under martial law and suspended the privilege of the writ of habeas corpus; two days later the President approved this action. On August 20, 1942 the military police arrested one White, a civilian, on the charge of embezzling stock belonging to another civilian; two days later he was brought before a military Provost Court which orally informed him of the charge. He made objection to the tribunal's jurisdiction, a demand to be tried by a jury, and a request for additional time to prepare for trial in that order and all were overruled or denied. On August 25 he was tried, convicted, and sentenced to five years imprisonment; this sentence was later reduced to four years. Duncan, also a civilian, was arrested for engaging in a brawl with two armed Marine sentries on February 24, 1944, charged with assault, convicted and sentenced by the military to six months' imprisonment. Both White and Duncan challenged the power of the military tribunals by petitions for writs of habeas corpus filed in the United States District Court for Hawaii on March 14 and April 14, 1944, respectively. The petitions were granted after trial, on the finding by the district court that the courts had always been able to function but for the military orders closing them and consequently there was no military necessity for the trial of petitioners by

military tribunals. The Ninth Circuit reversed on the theory that martial law had been properly proclaimed; that martial law denotes a total military government displacing or subordinating the civil courts; and that the decision of the Executive as to what the public safety requires must be sustained if based on reasonable grounds and that such grounds did exist here. By a divided court our highest tribunal reversed the Ninth Circuit and affirmed the trial court. The majority felt that the allowable limits of military discretion had been exceeded in closing the civil courts to the trial of these petitioners and relied upon such factors as these: testimony of the Governor of Hawaii and the Chief Justice of the Hawaiian Supreme Court that the civil courts were able, apart from the closing military order, to function without endangering good order or the public safety; failure of the military authorities to advance any substantial reasons countering this testimony; and the fact that the military had relaxed many controls over ordinary life at a date earlier than the periods involved in these cases. Illustrating the latter point it was noted that the military allowed places of amusement to be opened December 24, 1941, permitted the courts to exercise their normal functions except as to jury trials and the issuance of writs of habeas corpus on January 27, 1942, and on February 4, 1942, authorized the sale of liquor at bars. Justice Burton, dissenting, was unwilling to substitute his judgment in 1946, after the war had been won, for that of the military made during the dark, foggy days of the war when Hawaii was either an actual battlefield or a strategic area in the theatre of war. And he suggests that the Supreme Court would not have granted habeas corpus to oust the military courts on the dates involved, or if it had been so presumptuous that its orders could not have been enforced. "In order to recognize the full strength of our Constitution, both in time of peace and in time of war," he states, "it is necessary to protect the authority of our legislative and executive officials, as well as that of our courts, in the performance of their respective obligations. . . ." *Duncan v. Kahanamoku*, 327 U.S. 304, noted in 14 Geo. Wash. L. Rev. 522.

There has been a similar time lag carrying us past the cessation of the war in working out the scope of judicial review to which civilians were entitled under the Selective Training and Service Act of 1940. In *Falbo v. United States*, 320 U.S. 549, decided in 1944, the Court held that in a criminal prosecution under § 11 of that Act a registrant could not defend on the ground that he was wrongfully classified by his draft board and was entitled to a statutory exemption, where the offense was a failure to report for induction into the armed forces or for work of national importance. Then in *Billings v. Truesdell*, 321 U.S. 542, also decided in 1944, the Court held that a selectee, who reported to the military authorities at the induction center as ordered by the local draft board and as required by the *Falbo* case in order to exhaust his administrative remedies, was not amenable to military law if he refused to take the oath of induction. But it was not until 1946 in *Estep v. United States*, 327 U.S. 114, discussed in 44 Mich. L. Rev. 874, 32 Va. L. Rev. 618, that the Court established what defenses were available to such a person when indicted and tried by the civil authorities under § 11 of the Act for wilfully failing and refusing to take the oath of induction. In the *Estep* case both defendants were Jehovah's Witnesses and each had claimed that by that fact he was a minister of religion and entitled to be classified as IV-D. The lo-

cal boards had denied the claim and classed each of them as I-A; the appeal boards affirmed; in the case of one defendant an appeal to the President was denied, in the other case an appeal to the President was allowed and the classification was again affirmed. Each defendant then reported for induction, was accepted by the military authorities, but each refused to be inducted. In the ensuing criminal prosecution by the civil authorities each defendant was denied the right to prove that he was a minister entitled to exemption. Reversing the convictions and remanding for a new trial the Court stated: "we start with a statute which makes no provision for judicial review of the actions of the local boards or the appeal agencies. . . ." But we "cannot believe that Congress intended that criminal sanctions were to be applied to orders issued by local boards no matter how flagrantly they violated the rules and regulations which define their jurisdiction. We are dealing here with a question of personal liberty. . . . The provision making the decisions of the local boards 'final' means to us that Congress chose not to give administrative action under this Act the customary scope of judicial review which obtains under other statutes. It means that the courts are not to weigh the evidence to determine whether the classification made by the local boards was justified. The decisions of the local boards made in conformity with the regulations are final even though they may be erroneous. The question of jurisdiction of the local board is reached only if there is no basis in fact for the classification which it gave the registrant." The right of the returning veteran, under the Selective Training and Service Act, to his old job has, on the other hand, been settled more expeditiously. In *Fishgold v. Sullivan Drydock & Repair Corp.*, 66 S.Ct. 1105, it was ruled that although a returning veteran "does not step back on the seniority escalator at the point he stepped off" but "steps back on at the precise point he would have occupied had he kept his position continuously during the war," such a veteran may be laid off due to slackening of work and a non-veteran retained on the job whose seniority is greater. "We agree with the Circuit Court of Appeals that by these provisions Congress made the restoration as nearly a complete substitute for the original job as possible. No step-up or gain in priority can be fairly implied."

The United States successfully denaturalized a leader of the German Bund for taking a false oath of allegiance to the United States. The Court adhered to the requirements of the *Baumgartner* case, discussed in the 1945 review, (1) that "when denaturalization is sought . . . the standard of proof required is strict" and (2) that "the state of mind existing when the oath was administered" was the criterion of the necessary intent, but concluded: ". . . there is solid convincing evidence that Knauer before the date of his naturalization, at that time, and subsequent was a thorough-going Nazi and a faithful follower of Adolph Hitler. The conclusion is irresistible, therefore, that when he forswore allegiance to the German Reich he swore falsely." *Knauer v. United States*, 66 S.Ct. 1304. The Court, however, overruled an established line of precedent that an alien who refuses to take an oath of willingness to bear arms in defense of this country is not entitled to citizenship. *Girouard v. United States*, 326 U.S. 714 (reversing the First Circuit for its denial of citizenship to a Canadian Seventh Day Adventist who refused to take the oath for religious reasons), noted in 14 *Geo. Wash. L. Rev.* 641, 4 Nat. B. J. 137. For discussion of the subject dealt with in this subhead, see Fraenkel,

*War, Civil Liberties and the Supreme Court 1941 to 1946*, 55 *Yale L. J.* 715.

Turning to the economic side the decisions, while naturally of a more pedestrian character, have been fairly important. Under the exercise of its war power Congress could constitutionally make the Emergency Price Control Act of 1942 applicable to states and their political subdivisions. Thus the State of Washington was subject to ceiling prices in its sale of timber despite its constitutional provision requiring sale to the highest bidder. *Case v. Bowles*, 327 U.S. 92; and see *Hulbert v. Twin Falls County, Idaho*, 327 U.S. 103 (sales of tractors by county subject to price regulation). Due to the power of a court of equity to mould its decrees to the necessities of the particular case and because of the public interest involved, a federal district court could, in a suit by the Price Administrator, order the landlord to make restitution to tenants of monies collected in excess of the rent ceilings, in addition to its well recognized power to enjoin violations. *Porter v. Warner Holding Co.*, 66 S.Ct. 1086. And it also had the power in a suit by the Administrator to restrain state court eviction proceedings brought by the landlord against a tenant. *Porter v. Dicken*, 66 S.Ct. 1094; *Porter v. Lee*, 66 S.Ct. 1096. A contrasting illiberality of approach is to be found, however, where the enforcement proceeding is of a criminal character. With an over meticulous regard of legal niceties in a criminal trial for violating ceiling prices in the sale of turkeys by requiring the retailer also to purchase chicken gizzards, feet and skin, the Court reversed the conviction of a wholesale meat and poultry dealer. The dissent of Justice Black is realistic. "We were at war in 1943," he points out. "Scarcity of food had become an acute problem throughout the nation. . . . Certainly these particular butchers [the retail purchasers] forced to buy these unwanted items for the first time were not the regular outlet for disjointed chicken feet and peeled chicken skins, if there ever was such an outlet on a voluntary basis. . . . When food is scarce and people are hungry it is a violation, both of the letter and spirit of the Price Control laws, to require consumers or retail stores where they make their purchases, to buy things that they neither need nor want as a condition to obtaining articles which they must have." *M. Kraus & Bros. Inc. v. United States*, 66 S.Ct. 705, noted in 14 *Geo. Wash. L. Rev.* 647. Quite properly decisions construing amendments to the Price Control Act reflect their restrictive nature on federal regulation. Thus under the Act passed in 1942 a protest had to be made to the Administrator within sixty days after promulgation of the regulation, or thereafter within sixty days solely on grounds arising after the initial sixty day period. Under the amendatory Stabilization Act of 1944 it was ruled that Congress had, however, authorized a protest to be filed at any time after the effective date of the regulation. *Utah Junk Co. v. Porter*, 66 S.Ct. 889. *Accord: Collins v. Porter*, 66 S.Ct. 893 (petitioners as stockholders of a distilling corporation had, on its dissolution, received as their share of the assets, warehouse receipts covering the bulk whiskey owned by the corporation, and in 1943 had sold these receipts above ceiling prices for bulk whiskey; the Administrator's position was that the receipts were not "securities," expressly exempt from pricing provisions, but were subject to price ceilings for bulk whiskey established in 1942; held that petitioners in May, 1945 could file a protest with the Administrator challenging the validity or applicability of his 1942 order). And construing

the Taft Amendment, effective July 16, 1943, the Court ruled that then existing price regulations based on standardization or grouping of commodities by the Administrator became ineffectual until he made a specific finding that no practicable alternative exists for securing effective price control. *Thomas Paper Stock Co. v. Porter*, 66 S.Ct. 884 (Justice Black dissented on the theory that a regulation valid on the effective date of the Amendment and admittedly valid two months later when the Administrator had made the specific finding should not be held invalid in the interim period, since this would leave no price control on commodities, which the Administrator had earlier standardized, during the interval required for him to recheck his regulations). In construing the Renegotiation Act and in applying principles of eminent domain a broad approach was taken. Accordingly it was ruled that where compensation for chartered vessels was to be paid by the United States although the chartering was technically between a steamship corporation and the British Ministry of War Transport instead of the United States, the question of whether the contract is within the Renegotiation Act is first for the Price Adjustment Board with subsequent right of review by the Tax Court. *Macaulay v. Waterman S.S. Corporation*, 66 S.Ct. 712. And that where the United States had taken over a municipal airport and had flown its military planes in taking off and landing at such low altitudes as to interfere with the living and commercial use of adjacent property (in this case a chicken farm), there was a taking of an easement by the Government and the owner was entitled to just compensation under the Fifth Amendment. *United States v. Causby*, 66 S.Ct. 1062.

**Civil Liberties.** Among the decisions relating to the fundamental liberties safeguarded against federal action by the first nine amendments and against state action by the Fourteenth Amendment to the Constitution, the Court early asserted the freedom of the press from oblique censorship by postal authorities. Yet the issue became current again. In 1943 the Postmaster General, instituting a campaign to eliminate the distribution of "quasi-obscene" periodicals, had revoked the second class mailing privilege of the magazine *Esquire*. Although unable to prove *Esquire* obscene he took the position that the classification statute defining second class matter empowered him to prescribe qualitative standards for the literature and art which a mailable periodical must meet. The statute describes a mailable periodical as being "... originated and published for the dissemination of information of a public character, or devoted to literature, the sciences, arts, or some special industry..." The Postmaster General contended that *Esquire* was indecent, vulgar, and risqué, and was, therefore, "not making the 'special contribution to the public welfare' which Congress intended by the [above definition]." The Supreme Court invalidated his revocation order and held that Congress had given the Postmaster General no power to pass on the quality of the contents of periodicals, and that the inference of such authority would result in censorship. The Postmaster had denied any censorship on the grounds that *Esquire* was not being barred from the mails or prevented from publishing and that, since second class mail is carried at a loss, the government was merely revoking a subsidy which was not a right but a mere privilege. But because of the competition among periodicals no newspaper or magazine could afford to distribute at other than second

class rates and, therefore, revocation of second class privileges is functionally equivalent to total censorship. *Hannegan v. Esquire*, 326 U.S. 708; and see 53 *Yale L. J.* 733 (commenting on lower court decision). Freedom of the press was further safeguarded by holding that newspaper cartoons and editorials portraying half truths and commenting derogatorily about a particular Florida court did not constitute a contempt of that court. The vague test of a "clear and present danger to the administration of justice" was reiterated as the only delimiting factor of permissible criticism of the judiciary. *Pennekamp v. Florida*, 326 U.S. 709.

The Supreme Court, however, narrowed further the scope of the immunity against unreasonable search and seizure guaranteed by the Fourth and Fifth Amendment over vigorous dissents by Justices Murphy, Frankfurter and Rutledge. In *Davis v. United States*, 66 S.Ct. 1256, Davis, a filling station operator, was arrested for the misdemeanor of operating a black market in gasoline. Then the government agents, without a warrant, threatened to break and enter his service station office and thus "induced" Davis to unlock the door. There the officers found ration coupons in excess of the gallonage necessary to refill the storage tanks. In the prosecution of Davis on the new charge of illegally possessing ration coupons the seized coupons were admitted in evidence over timely objection. In affirming the conviction the Court, through Justice Douglas, held that Davis had voluntarily consented to the search since the amount of compulsion used by the officers was not unreasonable. The permissible limits of persuasion were said to be not so narrow where the officers sought to inspect public property (the ration coupons being the property of the O.P.A.) at a place of business as when private papers were sought at a private residence. The dissent decried the logical extremes of this position and added: "To make voluntariness turn on the nature of the quest instead of the nature of the response of the person in control of the sought documents, is to distort familiar notions on the basis of which the law has heretofore adjudged legal consequences." The same cleavage of the Court appeared in *Zap v. United States*, 326 U.S. 692. The defendant, an aeronautical engineer under contract with the Navy Department to perform experimental work, falsified his costs in presenting his voucher to the government. F.B.I. agents who audited his books under the contract discovered a padded check among his accounts and took the check as evidence despite protest. Justice Douglas again held the seizure valid because the search was authorized by contract. Justice Frankfurter, dissenting, contended that the seizure was distinct from the search and that the check could not have been lawfully obtained even with a warrant since it was not material of which possession was a crime. Appraisal of these two decisions depends upon how literally one believes the words of the Fourth and Fifth Amendments must be followed. With relative unanimity, however, the Court held that for Congress to empower administrative officials to issue subpoenas duces tecum in aid of authorized inquiries did not violate the Fourth or Fifth Amendment. *Oklahoma Press Pub. Co. v. Walling*, 327 U.S. 186 (Justice Murphy was a lone dissenter), noted in 34 *Calif. L. Rev.* 428, 14 *Geo. Wash. L. Rev.* 602.

An interesting example of judicial method occurred when the Court struck down a state Jim Crow statute, not as violative of the Fourteenth Amendment, but as within the interdict of the

cal boards.

of the clause. Irene Morgan, a Negress, was case acted by a Virginia state court for non-compliance with a statute which required both inter- and intrastate buses to separate without discrimination the white and colored passengers so that contiguous seats would not be occupied by persons of different races. The Supreme Court, limited on appeal to the commerce question, reversed the state conviction and invalidated the statute as a burden on interstate commerce. *Morgan v. Virginia*, 66 S.Ct. 1050, discussed in 46 Col. L. Rev. 853.

Among the less spectacular, though important, decisions the Court dealt with familiar topics. For the first time since 1936 an act of Congress was held unconstitutional. Representative Dies, in an effort to remove "subversives" from influential positions in the Government had secured the addition of a section to an emergency appropriation act which cut off the salaries of three government employees whom he had found to have communistic leanings. In affirming a judgment of the Court of Claims awarding these employees their salaries the Court invalidated the section as a bill of attainder, i.e., a legislative act which inflicted punishment without judicial trial. *United States v. Lovett*, 66 S.Ct. 1073, noted in 46 Col. L. Rev. 849. Jehovah's Witnesses were allowed to trespass on private property unmolested. Freedom of press and religion permitted a Witness to distribute literature on the streets of a company owned town contrary to the wishes of the management, *Marsh v. Alabama*, 326 U.S. 501, and from door-to-door through a village owned by the Federal Public Housing Authority, *Tucker v. Texas*, 326 U.S. 517. Selection of a jury panel wherein those who worked for a daily wage were excluded because invariably excused by the judge were held to violate the Seventh Amendment's provisions for jury trial in federal courts. Jury trial contemplates an impartial jury drawn from a cross-section of the community and selected by court officials without systematic or intentional exclusion of any group or class. *Thiel v. Southern Pac. Co.*, 326 U.S. 716, noted in 59 Harv. L. Rev. 1167. Right to counsel in state criminal proceedings was considered satisfied when the defendant was represented by an attorney on the day of sentence, although without counsel or advice of his right thereto when he was arraigned and pleaded guilty to a robbery charge. *Canizio v. New York*, 326 U.S. 705, noted in 46 Col. L. Rev. 647. A state conviction of murder at the second trial of defendant Ashcraft was again reversed. The first conviction had been reversed because of the State's use of the defendant's involuntary confession. 322 U.S. 143, discussed in the 1945 review. At the second trial the State used all the jail evidence, except the confession, covering the 36 hours when Ashcraft was held incommunicado and subjected to constant questioning. In remanding the case for a third trial the Court ordered exclusion of all testimony pertaining to what took place during that period. *Ashcraft v. Tennessee*, 326 U.S. 713. For other cases bearing on civil liberties see the cases of *Yamashita*, *Duncan v. Kahanamoku*, *Estep v. United States*, *Knauer v. United States*, and *Girouard v. United States*, discussed in the preceding subhead.

**Labor and Business.** Following the trend noted in last year's review remedial labor legislation has been interpreted very liberally. Enforcement of the Fair Labor Standards Act, sometimes known as the Wage-Hour Act, has been implemented and coverage extended. The Court has sustained a

broad use of the subpoena by the Administrator in checking to see whether a business is within the Act's coverage and, if so, whether there has been compliance. *Oklahoma Press Pub. Co. v. Walling*, 327 U.S. 186. The concept of a free press does not immunize newspapers from the Act's applicability; and a local daily newspaper with a circulation ranging from 9,000 to 11,000 copies, with only about 45 copies—one half of one percent—going out of state, was held subject to the Act. *Mabee v. White Plains Pub. Co.*, 327 U.S. 178. Neither the employer nor the employee need be engaged in interstate commerce. It is enough that the employee be employed, for example, in an occupation which is necessary to the production of a part of any other articles or subjects of trade of any character which are produced for interstate commerce. This principle of coverage and the principle of enforcement are well illustrated by the *Schulte* case. Schulte owned a twenty-three story loft building in the garment manufacturing district of New York City. It rented this building to some twelve tenants who received, worked on and returned in intrastate commerce goods belonging to non-occupants who subsequently in the regular course of their business shipped to other states substantial proportions of the clothing produced by the tenants. In *Kirschbaum v. Walling*, 316 U.S. 517, decided on June 1, 1942, the Court had ruled that service and maintenance employees in buildings tenanted by manufacturers producing for interstate commerce were covered by the Wage-Hour Act. After this decision the service and maintenance employees of the landlord, Schulte, made claims under the Act against their employer for overtime pay and an additional equal amount as liquidated damages. Schulte in good faith denied liability contending that since its tenants did not ship their products directly in interstate commerce it was not within the rule of the *Kirschbaum* case. Under threat of suit the employer entered into a compromise with its employees by paying the overtime compensation. Subsequently the employees sued to recover liquidated damages. Recovery was allowed on the theory that the employees were within the Act's coverage, and that the bona fide settlement did not constitute a valid release. *D. A. Schulte, Inc. v. Gangi*, 328 U.S. 712. Ruled within the Act's coverage were: a local company which washed windows of industrial companies engaged in interstate production, *Martino v. Michigan Window Cleaning Co.*, 327 U.S. 173; employees of a company engaged in repairing and installing electric wiring and motors for customers producing goods for interstate commerce, *Roland Electrical Co. v. Walling*, 326 U.S. 657; mechanics of a co-partnership engaged exclusively in servicing transportation equipment for an interstate motor carrier, *Boutell v. Walling*, 66 S.Ct. 631. And although the Wage-Hour Act exempts an employer, otherwise within its coverage, who operates a "retail or service establishment the greater part of whose selling or servicing is in intrastate commerce," this exemption contemplates an establishment serving ultimate consumers beyond the end of the flow of goods in commerce. Hence the employer in the *Martino*, *Roland Electrical* and *Boutell* cases, supra, was not exempted. For general discussion, see Dodd, *The Supreme Court and Fair Labor Standards, 1941-1945*, 59 Harv. L. Rev. 321. And in *Anderson v. Mt. Clemens Pottery Co.*, 66 S.Ct. 1187, the Court applied the portal to portal pay theory of the coal mine cases, noted in the reviews for 1945 and 1946, to a manufacturing establishment and laid the basis for current back

pay suits aggregating several billions of dollars.

Remedial coverage under other legislation was also effected. Thus a carrier affiliate, such as a warehouse corporation owned by a railroad, which engaged in loading and unloading railroad cars was performing services in connection with the transportation of property by rail which, if performed by the railroad, could have been included in its line-haul tariffs or separately charged, and was, therefore, subject to both the Railroad Retirement and the Unemployment Insurance Acts. *Railroad Retirement Board v. Duquesne Warehouse Co.*, 326 U.S. 446. The "next of [dependent] kin" clause of the Federal Employers' Liability Act was broadly construed to impose liability upon the carrier in *Poff v. Pennsylvania R. Co.*, 326 U.S. 712. And seamen were held to retain their rights under the Jones Act against the operators of vessels taken over by the War Shipping Administration either by time-charter in which case the seamen remained the private employees of the vessels' owners, or by bare-boat-charter in which case the Administration became the owner and technically the employer while the charterers continued as operators. *Hust v. Moore-McCormuck Lines*, 66 S.Ct. 1218. "Back pay" granted by the National Labor Relations Board to an employee because of wrongful discharge constituted "wages" under the Social Security Act and the employee is entitled to have the Social Security Board credit him accordingly. *Social Security Board v. Nierotko*, 326 U.S. 700.

While administrative interpretation was rejected in the last case, administrative action is presumptively correct, may not be short circuited, and is normally sustained. These propositions are illustrated by the following cases. While adhering to its decision noted in last year's review that the Railway Adjustment Board's award against individual claimants is not binding upon them, where they had no notice of and did not personally participate in the hearing preceding the award, unless the union representative who did appear had their authority to act for them, the Court now clarifies its position by placing upon the claimants the burden of showing that the union representative had not been given authority by them to act in their behalf. *Elgin, J. & E. Ry. Co. v. Burley*, 328 U.S. 801. Although a bankruptcy court was warranted in instructing the trustees of the debtor railroad in reorganization to permit yard conductors to operate certain trains within the yards, rather than road conductors, this amounts to no more than the decision any other carrier would have to make and would not finally settle the union-employer dispute which is for the Railroad Adjustment Board. *Order of Railway Conductors of America v. Pitney*, 326 U.S. 561. And on the finding of past hostility against unionization the National Labor Relations Board had the power to include an injunctive provision against prospective interference, and an objection by the employer to this provision made for the first time in an enforcement proceeding comes too late. *N.L.R.B. v. Cheney California Lumber Co.*, 327 U.S. 385.

The Kickback Act of 1934 makes it unlawful to prevent anyone employed in construction or repair work of a public nature or financed in whole or in part by the United States from receiving the full compensation to which he is entitled. The legislative history showed that its main purpose was to suppress the so-called "kick-back racket" by which a government contractor paid his laborers at the rate the Government required, but

thereafter forced them to give back a part of the wages received. In *United States v. Carbone*, 66 S.Ct. 734, union officials were indicted under the Act. Their union had an agreement with government contractors whereby the latter undertook to employ as laborers only such persons as were approved by the union officials and to discharge any such employees at the officials' request. Non-union workers were required by the union officials to pay \$5 per week, as a condition of keeping their employment, until payment of the union's initiation fee, originally \$50, later reduced to \$40 and then to \$20, had been made. If full payment was made the worker became a member of the union. The Government charged that the defendants, however, retained for their personal use amounts received from laborers who paid less than the full initiation fee required to become a member of the union. The Court concluded that while this might constitute a state crime, such as embezzlement, it did not come within the federal Act since the union officials had a right to demand a closed shop and that the weekly collections were necessary to that right. For discussion of lower court decision, see 46 Col. L. Rev. 326.

In applying the Sherman Anti-Trust Act to business the Court has subscribed rather enthusiastically to the Act's underlying thesis that "possession of unchallenged economic power deadens initiative, discourages thrift and depresses energy; that immunity from competition is a narcotic, and rivalry is a stimulant, to industrial progress; that the spur of constant stress is necessary to counteract an inevitable disposition to let well enough alone." Sustaining criminal convictions of the Big Three tobacco corporations, *American, Liggett & Myers*, and *R. J. Reynolds*, manufacturers of Luckies, Chesterfields and Camels, the Court holds that actual exclusion of competitors is not necessary to the crime of monopolization. *American Tobacco Co. v. United States*, 66 S.Ct. 1125; see 54 Yale L. J. 707 discussing court of appeals' decision. In this case the Court also endorses the *Aluminum* decision of the Second Circuit, 148 F. (2d) 416, where, because of the absence of a Supreme Court quorum, Congress authorized the Second Circuit to decide the case "in lieu of a decision by the Supreme Court." In the *Aluminum* case monopoly had been thrust upon the business by new discovery and original entry into a new field, but this monopoly coupled with power, intent and maintenance of it sufficed to violate the Sherman Act. The Court's contrasting position in divorcing labor unions from applicability of the Sherman Act is noted by Professor Gregory in his recent book, *Labor and The Law*, where he advances the proposition that "labor unionism is a frankly monopolistic and anti-competitive institution" and that society should be protected under the Sherman Act against many undesirable union practices. For other discussion of the problem of adjusting labor-business relationships, see Gerhart, *Labor Disputes: Their Settlement by Judicial Process*, 32 A.B.A.J. 752 (American Bar Association's Ross Essay).

**Decisions Concerning the Federal System.** Although the Court has quite consistently invalidated state interference with civil liberties, it has been reluctant to adjudge state action improper in other fields of law. An illustrative example is the Court's refusal to pass upon the congressional districting by Illinois on the ground the issue was political. *Colegrove v. Green*, 66 S.Ct. 1198. Two exceptions to this laissez-faire policy are found in the field of state taxation. *Doris Duke Cromwell ob-*

tained a declaratory judgment that a discriminatory tax assessment by her resident township in New Jersey violated substantive due process. *Hillsborough Township v. Cromwell*, 326 U.S. 620. Richmond's \$50 license tax imposed upon solicitors and drummers was also invalidated as a burden upon interstate commerce because of its effect and since itinerants soliciting orders for out-of-state concerns in several towns would be penalized more than intrastate solicitors. *Nippert v. City of Richmond*, 66 S.Ct. 586.

Within the sphere of intergovernmental tax immunity the controversial *Saratoga Springs* case left in doubt the criterion of when a tax impairs the sovereignty of another government. The United States was allowed to tax the State of New York upon its sales of bottled mineral water, but seriatim opinions created uncertainty as to the fundamental rationale. All the justices decried the distinction between state governmental and proprietary functions for tax purposes. Justice Frankfurter would uphold any tax which did not discriminate against a state in favor of private enterprises of a like nature. The late Chief Justice would permit any impost not placing an undue economic burden on the taxed government. In their dissent Justices Douglas and Black anomalously advocated absolute tax immunity for both governments—perhaps to enhance the state's financial ability to pursue liberal, social legislation should the federal government be swept by conservatism. The precipitate of the opinions, however, would appear to give the state a lesser tax immunity than would be accorded the federal government. *New York v. United States*, 326 U.S. 572, see 55 Yale L. J. 805. In *S.R.A., Inc. v. Minnesota*, 326 U.S. 703, the United States contracted to sell surplus federal land to a private corporation; and while relinquishing possession retained a security title. Minnesota taxed the realty to the corporation, "subject, however, to the prior rights, liens and interests of the United States." The Court sustained the tax on the grounds that the unrestricted transfer of the property to non-federal hands was a relinquishment of exclusive federal jurisdiction; the United States was only a mortgagee while the corporation held the beneficial and hence taxable interest; and Minnesota had subordinated its tax to the federal interests. Thus, it would appear that when the United States reserves a security interest in property conveyed by it, state acknowledgement of this paramount interest will help avert the vagaries found in intergovernmental tax immunity concepts. Cf. *Wilson v. Cook*, 326 U.S. 685.

In view of the plenary power of Congress over interstate commerce, the Court sustained the McCarran Act, 15 U.S.C. §§ 1011-15, which declared that "the continued regulation and taxation by the several states of the business of insurance is in the public interest." *Prudential Ins. Co. v. Benjamin*, 66 S.Ct. 1142 (upholding South Carolina gross income tax on the aggregate of premiums received within the state by foreign insurance companies). And state power to regulate the solicitation of insurance by an agent representing a non-admitted insurer was sustained in *Robertson v. California*, 66 S.Ct. 1160. A suit to recover a miscomputed tax from Utah tax commissioners was held to be a suit against the state and not maintainable in the federal court without the State's clear consent. *Kennecott Copper Corp. v. State Tax Comm.*, 326 U.S. 711. And a federal claim for unemployment compensation taxes was a debt due the United States which had to be satisfied in full from the estate of an insolvent making a voluntary assign-

ment for the benefit of creditors. *People ex rel. Gordon v. United States*, 66 S.Ct. 841.

**Judicial Administration and Law Reform.** With Frederick Moore Vinson commissioned as the thirteenth Chief Justice and with the return of Justice Jackson from the Nuremberg Trial where he acted as the American prosecutor, the Court opened its October 1946 Term with a full complement of nine Justices. For the first time in a year the Court's entire personnel is available to hear and decide cases. This should lead to a lighter judicial load for each justice and, what is more important, should facilitate the proper disposition of cases in which the Court is about evenly divided. There is also professional hope that the new Chief Justice can temper the discord to be found among some of the Justices and bring the Court as a unit to a better working level. The new Chief Justice succeeds the late Harlan Fiske Stone who gave twenty-one years of devoted and highly distinguished service to the Court: sixteen years as an Associate Justice, five years as the twelfth Chief Justice. In commemoration see the articles in 46 Col. L. Rev. 693-800.

The Rules of Criminal Procedure for the federal district courts, promulgated by the Supreme Court with the assistance of an advisory committee, became effective March 21, 1946. The group of experts assisting the House Committee on Revision of the Laws has prepared a bill to revise the Judicial Code. Because the bill would make some important changes in the jurisdiction and administration of the federal court system, because of its comprehensive coverage, and because of the changing personnel of the Congressional committees interested in this basic legislation it is unlikely that the bill will be enacted at an early date. The Supreme Court's Advisory Committee on Rules of Civil Procedure has made its final report to the Court in which it proposes a number of amendments to the Rules, most of which are largely clarifying in nature. Proposed amendment to Rule 30(b) is, however, important and controversial. For good cause shown it authorizes inquiry into writings obtained or prepared by the adverse party, his attorneys, agents or insurers in anticipation of litigation or in preparation for trial. This repudiates the rule of *Hickman v. Taylor*, 153 F. (2d) 212, certiorari granted 66 S.Ct. 1337, decided by the Third Circuit, sitting *en banc*, in which it held that statements of witnesses and memoranda of such statements made by a party's attorney were privileged and could not be inquired into by the other party. A resolution in opposition to the proposed amendment was adopted by the American Bar Association. Action by the Court on all of the proposed amendments is expected by January 1, 1947, in which event amendments promulgated by the Court would become effective approximately one year hence.

JAMES WM. MOORE.

**LEAD.** Shortage of lead in the United States in 1946 was greater than at any time during the war, and further government restrictions on its use caused belt tightening by manufacturers of such diverse products as lead-covered cable, storage batteries, paint, and gasoline. Strikes in mines and smelters, both in the United States and Mexico; increased production costs; declining ore reserves; continued dislocation of foreign producing areas; price confusion during lapse of the Premium Price Plan; and a prevailing world price higher than that paid in the United States all contributed to the shortage. The government estimated that United

States industry could have used the record amount of 1,300,000 tons during the year, compared to a total available of 800,000 tons, including secondary (remelted) metal.

A six weeks' mine strike in Mexico, from which most imports come, starting in January, was followed in February by a strike, which continued through June, against 18 U.S. mines, smelters, and refineries of American Smelting & Refining Co. These major disputes, plus intermittent labor disturbances at mines and plants of other major producers seriously handicapped production during the first half of the year, and to a lesser degree, during the latter part. Mines not directly affected by strikes were in many cases forced to shut down because of the smelter strikes making it impossible for them to dispose of their concentrates. The national rail and coal strikes in May also indirectly impeded lead output, according to the U.S. Bureau of Mines.

The lead crisis was worldwide. Western Europe, with heavy reconstruction needs, was unable to draw on its normal prewar sources in the mines of Silesia and Yugoslavia, whose entire output went to Russia. This demand was diverted to mines in the Western hemisphere and Australia. Mines in Burma, out of production during the war, did not resume production. The price of lead in the London market advanced to 9.9 cents per lb., hampering buying abroad by the United States government. The government purchased foreign lead at the world price, reselling to consumers at the lower domestic ceiling price until the final revocation of price control.

Pig lead imports for the year totalled approximately 125,000 tons, most of it from Mexico, plus a substantial tonnage from Canada and Peru. Australian output, which contributed to United States requirements during the war, went to Great Britain in 1946.

In an effort to spur domestic production, the Office of Price Administration on June 3 advanced the price ceiling on primary lead 1.75 cents per pound to 8.25 cents per lb., New York. Secondary lead, remelted from scrap, and anti-monial lead were given equivalent increases, and lead scrap increased 1.55 cents per lb.

Expiration of the price control law on June 30 soon was followed by a rise in the market price to 9.5 cents per lb. When the new price control act became effective July 26, the price reverted to 8.25 cents. During the interim, shipments of lead scrap, with price ceilings removed, soared to new highs. Mine production of lead was not thus affected, however. Suspension of the Premium Price Plan (see 1944 and 1945 YEAR BOOKS) concurrent with the price control lapse created such uncertainty among mines which had been receiving premium price payments for over-quota production, that many were shut down. Reversion to the old price on July 26 found offerings by producers, other than from mines selling under the Premium Price Plan, greatly restricted. Following final revocation of price control November 11, the price rose to 12.55 cents per lb. at the end of 1946.

Mine production in the United States for the year was approximately 332,478 tons (1945: revised, 390,831 tons). Nearly half came from the southeastern Missouri district. Most of the balance was mined in the far Western States, where the Coeur d'Alene district of northern Idaho led in production, with substantial amounts from Utah, Colorado and Arizona.

Secondary recovery of lead from scrap was 350,000 tons, most of it from battery lead plates.

Lead was allocated to consumers by the Civilian Production Administration under its order M-38, with other orders restricting uses and inventories. Because of the restricted quantities available, allocations were considerably smaller than in 1945.

CHARLES T. POST.

**LEAGUE OF NATIONS.** The League of Nations formally dissolved on April 18 and turned over its non-political activities, library, and buildings in Geneva to the United Nations. Transfer of functions, powers and activities from the League to the United Nations fell into two main categories: functions pertaining to a Secretariat in the matter of the custody of the original signed texts of international agreements and the performance of routine duties not affecting the operation of the agreements or relating to the substantive rights and obligations of the parties; function and powers of a technical and non-political character under international agreements whose execution has hitherto been dependent on the exercise of such powers by the League of Nations or certain of its organs. Pending a survey of the League's non-political functions and activities, the United Nations Economic and Social Council provisionally assumed the work of the following League departments: the Economic, Financial, and Transit Department (particularly its research and statistical work), the Health Section (particularly the epidemiological service), the Opium Section and the secretariats of the Permanent Central Opium Board and Supervisory Body.

The United Nations Educational, Scientific, and Cultural Organization assumed all matters formerly included in the League's Intellectual Co-operation department. The mandated territories which were assigned by the League were placed into the United Nations trusteeship system.

**LEEWARD ISLANDS.** British possessions in the Leeward Islands of the West Indies consist of the four presidencies of Antigua (with Barbuda and Redonda); St. Christopher and Nevis, with Anguilla and Sombroero; Montserrat, and the Virgin Islands. Area, 422 square miles. Population (1944 estimate), 102,000.

Antigua is the seat of government of the federal colony, which is administered by a Governor and Commander in Chief, assisted by an Executive Council and a Legislative Council of 9 elected and 9 appointed members. The elected members are chosen by members of the legislative councils of the constituent presidencies (except for the Virgin Islands, which have no legislature) as follows: 3 by Antigua, 3 by St. Kitts, 2 by Montserrat and 1 (appointed by the Governor) for the Virgin Islands. (See ANTIGUA.)

**LIBERAL PARTY.** A Political party organized in New York State May 19, 1944. Chairman: Dr. John L. Childs; Secretary: Joseph V. O'Leary; Vice Chairmen: David Dubinsky, Dr. George S. Counts, Alex Rose, Reinhold Niebuhr; Executive Director: Ben Davidson.

Contains 80 Assembly District Clubs in New York City, County organizations in the various counties of the State; a Trade Union Council comprising A.F. of L. and C.I.O. unions with a membership of over 500,000; a Women's Division; Business Men's Committee; and the Young Liberals as its Youth Section.

It has published: *Declaration of Principles and National Platform; State Legislative Program; For Our City (Municipal Program for New York City);*

*America's First Need—A New Political Realignment; America and the Winning of the Peace.*

In 1944 its candidates were Roosevelt and Truman; in 1946 Mead and Lehman, for Governor and United States Senator.

State Headquarters: 160 West 44th Street, New York 18, New York.

**LIBERIA.** A Negro Republic, founded in 1847 by freed slaves from the United States, on the west coast of Africa between Sierra Leone and the Ivory Coast. Capital, Monrovia (population, 10,000).

**Characteristics of the Population.** No proper census has ever been taken, and the population is estimated at anywhere from one to two million. Only about 60,000 of the coast Negroes are considered civilized by European standards. Among them are some 12,000 Americo-Liberians—the descendants of freed slaves from the United States—who form the governing and intellectual class. The natives are divided among six principal stocks and various smaller tribes. The Mandingoes are Moslems and most of the rest are pagans, though various Christian missions are operating in the country. English is the language of government and commerce. In 1945 there were 204 schools (81 run by the Government), of which two were of college rank. The great mass of the Liberian people is illiterate and wholly innocent of any formal education.

**Government.** The frame of government is modeled after that of the United States. There is a President and his Cabinet, a Senate and a House of Representatives. The President, elected in 1943 for the term 1944–52, is William V. S. Tubman of the True Whig Party. This party is controlled by a small oligarchy of Americo-Liberian families dwelling in the few coastal cities, for the franchise is restricted to Negro landowners. This party has pretty well monopolized political power in the Republic for the last three generations. The real natives of the country have participated very little in the national administration.

In recent years the government's revenue has exceeded expenditures, the relevant figures for 1944 being \$1,598,401 and \$1,522,137. Customs account for over half of the income; while debt charges, interest and amortization absorb one-tenth of the outgo. Under the terms of the Loan Agreement with the United States, Liberian finances are supervised by American experts. A first charge on all revenues is the service on the American loan. The external bonded debt as of Jan. 1, 1944 was \$1,113,500.

The armed forces consist of a militia of some 4,000 men and an enlisted Frontier Force of over 1,200. According to an agreement signed on March 31, 1942, the United States Government undertook to extend financial and technical assistance for organizing Liberian defense forces. Liberia also permitted the United States to exercise military control over certain of the country's airfields and defense areas. American troops arrived in Liberia in May 1942 to aid in defending the Republic for the duration of the war. Another agreement, signed on Dec. 31, 1943, implemented these previous commitments. Various technical missions and experts from the United States have been employed by the Liberian Government in recent years (see *YEAR BOOK* for 1944).

**Events.** President W. V. S. Tubman, who was inaugurated in January 1944, made political history by his policy of rapprochement with the "native" tribes that constitute the great mass of Liberia's population. Hitherto exploited and neglected by the few thousand Americo-Liberians along the

coast, these hinterland peoples were gratified to have the President come among them and attempt to win their confidence. His objective, as reported by one observer, was to integrate "them into the country's civic and social stream as citizens of Liberia," and to remove them from the status of "colonial subjects." The new election law, extending the franchise to all who pay the hut tax, would if enforced break the political monopoly of the Americo-Liberians, and perhaps threaten the continued supremacy of the President's own party—the True Whigs. The Tubman administration also announced during the year the outlines of a five-year plan of public works costing \$25,000,000 and aimed at raising the economic and social level of the entire country.

All these reforms naturally aroused the animosity of the old guard, whose privileged position was endangered. But apparently the President could count on the benevolent attitude of the United States Department of State, as well as on the loyalty of the bulk of his countrymen, thus leaving the opposition high and dry.

Evidences of American interest in Liberia continued to accumulate. Already operating in the country were several missions, among them a Foreign Economic Administration commission of economic and agricultural exports; an all-Negro public health group; and a geological survey commission. Meanwhile the construction of a deep-water harbor at Monrovia with funds (\$15,000,000) advanced by the United States government to be repaid from eventual port revenues, was started. The work was undertaken by the United States Navy, which was to use it for the defense of the "strategic interests of the United States in the South Atlantic," and the Raymond Concrete Pile Co. of New York. When completed the port was to be operated by the Clark-Babbitt Co. of Boston. On February 16 work commenced on the south jetty, in the presence of President Tubman and other dignitaries.

This harbor development project was the scene of the first organized strike in Liberia's history. The walk-out began on December 15, 1945, but after government intervention work was soon resumed while negotiations continued. The fundamental issue was over the great differential in wage rates and conditions of work between the local workers and those imported from abroad. Other complaints dealt with provisions for medical care and various Jim Crow regulations, which were naturally much resented by the Liberian workers.

A source of heated political argument during the year was the concession granted to Lansdell K. Christie of New York on August 27, 1945, permitting him to exploit iron ore and other minerals in the Bomi Hill area and to construct a railroad, telephone system, hydro-electric plant, and other appurtenances. This concession was confirmed by both Houses of the Liberian legislature in December 1945 and January 1946. However, the opposition continued to hurl various charges: that the deal had been consummated in haste and with undue governmental pressure; that it was too favorable to the concessionaire; that it was to run for too long a term (80 years), etc.

By far the most important enterprise in the country is the rubber plantation system of the Firestone interests. On September 20 the Liberian Consul-General in New York gave a banquet in honor of the hundredth anniversary of Liberia's independence. At this gathering it was announced that Firestone had given \$250,000 for the construction of an institute of tropical medicine in Liberia, the

annual operating expenses of which (\$60,000) were to be provided by the American Foundation for Tropical Diseases.

Liberia, a charter member of the United Nations, distinguished itself at the fall session of the General Assembly by taking a prominent part in the small countries' fight against the veto power of the five permanent members of the Security Council.

**Economy.** Most of the inhabitants, living in a tribal state, participate little or not at all in the world's money economy. Such resources as the country possesses are largely undeveloped. Almost the only export is raw rubber, produced on the Firestone plantations and shipped out through the port of Marshall, east of Monrovia. In 1944 exports were valued at \$10,306,309 and imports (largely manufactured goods) at \$4,103,980. There are no railways and very few roads, though the latter are being extended here and there, and no interior telegraph or telephone communications. There are several ports, but none with facilities for servicing vessels at docks; all operations are carried on by lighter. However, a harbor is being built at Monrovia (see *Events*). In 1944 the number of ships entering these ports was 53, of which 39 were American.

ROBERT GALE WOOLBERT.

**LIBRARY OF CONGRESS.** Dr. Luther Harris Evans, the Chief Assistant Librarian, assumed the duties of Acting Librarian after the resignation of Mr. Archibald MacLeish, the Librarian of Congress, in December 1944 to accept an appointment as Assistant Secretary of State.

Additions to the Library's collections during the fiscal year 1945-46 numbered about four million pieces, representing all types of material normally received through copyright, gift, and purchase, and an enormous quantity of items acquired through exchanges, through transfers from government agencies winding up their wartime activities, and through cooperation of military government and State Department officials in European countries which have been barred to ordinary communications since 1941.

Outstanding among the individual accessions was a collection of books and manuscripts presented by Lessing J. Rosenwald of Jenkintown, Pa., containing specimens of virtually all the important periods of bookmaking from the time of Gutenberg to the present day.

The national motion picture collection which the Library had formally established in 1945 was supported by a substantial Congressional appropriation for the fiscal year 1946-47. In developing its permanent collections the Library has aimed at preserving films which most faithfully record in one way or another the contemporary life, tastes, and preferences of the American people.

A special panel of critics chose 45 feature films, 48 short subjects and 104 newsreels from the 1945-46 output for incorporation in the Library's permanent collection. The motion picture collection also received 26,384 reels of impounded or captured German films—training pictures, newsreels, documentaries, and photoplays—and 105 reels dealing with the San Francisco Conference.

Ninety-two concerts were performed during the fiscal year 1945-46 under foundations connected with the Music Division. Twenty-three of the Whittall Foundation concerts at the Library were performed by the Budapest String Quartet and two were joint recitals by Adolf Busch (violin) and Rudolf Serkin (piano). The Elizabeth Sprague

Coolidge medal for eminent service to chamber music was awarded to Alexander Schneider.

In anticipation of the coming into effect of the Legislative Reorganization Act of 1946 the Legislative Reference Service was created, its chief function being to supply members of Congress in an impartial manner with factual information needed for the consideration of measures before them.

By virtue of its central role both among the Government's information-gathering agencies and among the nation's libraries the Library of Congress took the initiative in securing and distributing to research institutions huge quantities of printed matter produced during the war and released after the end of hostilities. Typical was the disposal of approximately a million surplus textbooks which had been used in the Army Specialized Training Program, the Navy V-12 courses, and other educational activities of the service branches. On behalf of the Veterans Administration the Library sorted, listed, and distributed these to schools and colleges during 1946 for the use of World War II veterans enrolled in courses under Public Laws 16 and 346, 78th Congress.

The collection of the Library, at the end of the fiscal year, June 30, 1945, included 7,877,002 printed books and pamphlets, 1,703,599 volumes and pieces of music, 1,639,505 maps and views, 575,083 fine prints, 936,412 photographic negatives, prints, and slides, more than 7,900,000 manuscripts, 43,343 microfilm reels and strips, 11,955 motion picture reels, and 123,134 phonographic recordings.

**LIBRARY PROGRESS.** Throughout the first postwar year, libraries and librarians attacked the problem of library extension with renewed vigor on local, state, and federal levels of government. New emphasis was placed on recruiting; the adult education movement gained impetus while librarians strengthened the old, and experimented with new methods of service.

**State and Federal Relations.** Appropriations for state library agencies and for state aid to libraries were generally increased during 1946.

In June, Missouri passed library laws which established the Missouri Library Commission. On October 15, a bill appropriating \$212,000 for state aid to libraries was signed by the governor. The new law provides for a public library service fund, one-half of which will be used for grants to established libraries meeting certain specified standards, and one-half for equalization and establishment of new service.

Ontario, Canada, secured new regulations covering grants to public libraries while Saskatchewan passed an act to provide for the establishment and maintenance of regional libraries.

Georgia included an additional \$50,000 in the Department of Education budget for state and for rural library service. In Louisiana, aid was increased by \$50,000 for the biennium 1946-1948; Maryland received its first appropriation of \$20,000 for 1946-1947, as aid to county libraries; New York State increased aid by \$2,000, for the year 1946-1947, to registered libraries meeting standards set by the Regents. The sum of \$300,000 was appropriated to the Illinois State Library for 1945-1947, for a series of demonstrations of rural library service in large areas called districts. In Vermont, \$66,000 was appropriated for 1946-1947 for four regional library centers and bookmobile services. Michigan received an increase of over \$70,000 for 1945-1947 for existing libraries and for the development of new services. No state or province re-

duced its appropriation for library extension agencies or state aid during 1946.

Although 26% of the total population is still without library service, 83 county or regional libraries were established last year, raising the total to 808.

The Library Development Fund campaign, closed officially at the A.L.A. Conference in Buffalo, New York, with a total of over \$88,000 in volunteer contributions from librarians. These funds are being used to maintain a four year program of library advancement administered by the American Library Association.

The National Relations Office of the American Library Association began operations October, 1945, in support of this program. Working with other library agencies, the office has been concerned with: the disposal of surplus books, and other surplus property to libraries; recognition by the government of the essentiality of library service in any national research program; inclusion of libraries in public works proposals; social security for library employees; maintenance of low postal rates on books; improvement in document distribution; distribution of war maps; and federal aid for demonstrations of library service especially in rural areas.

The Public Library Service Demonstration Bill (S. 1920—H.R. 5742), introduced into the House and Senate respectively March 13 to provide library demonstrations in rural areas, won the approval of the Senate Committee on Education and Labor, and of a sub-committee of the House Education Committee before Congress adjourned. The bill will be reintroduced at the next session of Congress.

This bill, as presented, calls for annual appropriations of \$25,000 for four years to any state with an authorized library administrative agency, which establishes policies and methods for utilizing the fund to maximum advantage. Additional funds would be used for demonstrations of library service in areas without an established library program or to improve existing conditions. Federal claims would be discontinued when library service's claim on local and state tax support had been demonstrated.

**International Relations.** American libraries did much throughout 1946 to assist libraries and librarians in foreign countries especially in devastated European war areas.

Of particular importance in 1946 was the American Book Center's campaign for books to be distributed to devastated libraries in war areas of the allied nations; interchange of librarians with foreign countries; attendance of students from other countries in American Library schools; maintenance of U.S. Information Centers abroad; and the acquisition by American libraries of important foreign publications, unobtainable in war years.

The importance of libraries in International Relations was emphasized in the program of the United Nations Educational, Scientific, and Cultural Organizations. Luther Evans and Verner Clapp of the Library of Congress and Ralph Shaw, librarian of the U.S. Department of Agriculture, took part in preliminary conferences in Paris in the Spring of 1946. Carl H. Milam, executive secretary of the American Library Association and Milton E. Lord, director of the Boston Public Library served as library consultants to the UNESCO delegation which met in Paris in late November. Ralph Ulveling of the Detroit Public Library represents the A.L.A. on UNESCO's national advisory commission.

The American Library Association continued to administer American libraries in the capital cities of Mexico, Nicaragua, and Uruguay with funds provided by the Department of State while books were sent free to other Latin American countries, from funds provided by the U.S. Department of State.

**Professional Training and Personnel.** Although enrollments in the 34 accredited library schools again showed an increase in 1945-46, the demand for trained librarians continued to be greater than the supply. In 1946 there were enrolled in library schools 1,499, as compared with 1,032 for the previous year. In the two Canadian library schools, 61 students were enrolled in 1945-1946, an increase of one-third.

Most library schools, in conjunction with the A.L.A. Board of Education for Librarianship, were engaged, during the past year, in revising library school curricula with special emphasis on undergraduate training programs. Arrangements were made at many library schools to admit veterans at mid-term.

The A.L.A. Board of Education for Librarianship recommended experimentation with refresher correspondence courses and short courses for untrained librarians, already in service in small libraries, in order to alleviate the shortage of personnel. A controversial publication during the year was Joseph L. Wheeler's *Progress and Problems in Education for Librarianship*, which questioned the value of present trends in professional education.

Two library schools were accredited in 1945-1946: New York State Teachers College, Geneseo, New York; and Marywood College, Department of Librarianship, Scranton, Pennsylvania.

The A.L.A. Board of Personnel Administration issued a *Salary Policy Statement* which advocated among other recommendations a minimum beginning salary of \$2,100 for professional library positions. A new statement of policy on tenure was also formulated.

Increases in salary were adopted in classification and salary plans by the Civil Service Commission and public libraries in Akron, Ohio; Chicago, Illinois; Des Moines, Iowa; Indianapolis, Indiana; Kansas City, Missouri; Milwaukee, Wisconsin; New York, New York; and the California and Michigan state libraries.

**Books and Reading.** The interest created in books and libraries during the war continued to grow during 1946. The tremendous free circulating library built up by the Army acquainted millions of servicemen with library service. As civilians, they are using the library to acquaint themselves with vocational and educational opportunities, and to continue reading habits formed in the Army.

The growing interest in library adult education is demonstrated by the progress of the Great Books Movement. Libraries are increasingly adopting discussion programs as popular education techniques.

Library service to business is developing even among the smallest libraries. Detroit, Newark, and Indianapolis libraries have been among the most active in this service.

Libraries have been devoting more attention to the circulation of educational and documentary films.

Opinion polls of librarians returning from military service, and of several hundred library trustees showed that both these groups believe that public, as well as school and college, libraries must accept films as an important educational tool, because of their success in military and industrial training.

**School Libraries.** State leadership in the development of school libraries made encouraging progress during the past year. In Indiana, the position of state library adviser has been transferred from the Indiana State Library to the State Department of Education. The 1945-1946 Equalization Bill in Connecticut provides increased state funds for school libraries.

In the South, a grant was made from the General Education Board to the Library Committee of the Southern Association of Colleges and Secondary Schools for a field visitor to advise on training for school librarianship and on state school library programs. Funds from the same source have been available for conferences on school librarian training, standards for school libraries, and school library supervision. As a result of the combined program, three state education departments have requested and have received the assistance of the General Education Board in establishing advisory service for school libraries. Texas, Mississippi, and South Carolina are now added to the states which have state school library supervisors. There are nineteen such supervisors throughout the country.

Some of the state expenditures for school library materials for the school year, 1945-1946, were: Florida, \$69,059; New Jersey, \$10,000; Minnesota, \$52,647; Georgia, \$134,000; North Carolina, \$116,656; Tennessee, \$38,455; and Wisconsin, \$146,406.

The value of library service to young people was emphasized throughout the year at conferences of both library and civic organizations. The General Federation of Women's Clubs chose as its theme for 1946-1947, "A Youth Library in Every Community."

**Gifts, Grants and Buildings.** A total of \$416,455 was received by the American Library Association to be used for special projects during the fiscal year ending August, 1946.

Book collections and monetary gifts to libraries for the purchase of books have materially aided libraries and their services throughout the past year. The first undergraduate library at Harvard University will be established through a \$1,500,000 grant from Thomas W. Lamont. Gifts to public libraries and library agencies during 1946 included: a \$100,000 trust fund for the Youngstown Public Library, Youngstown, Ohio, given by Justice John H. Clarke. Income from the bequest will be used to purchase books. The Library Association of Portland, Oregon, will receive \$2,400 a year from a trust fund established by Thomas Roberts. A \$25,000 bequest trust fund was left by Mrs. Lena D. Hesse to the Milwaukee Public Library, Milwaukee, Wisconsin. The Public Library, Monteguina, Indiana, received approximately 1,000 volumes from the estate of the late Lula J. Case. This gift also included a collection of famous paintings. The Macalester College Library received nearly 1,000 volumes on American hymnology, the greatest collection of such materials in the United States.

Among smaller gifts were a bequest of \$1,500 to the Greenfield Public Library, Greenfield, Iowa, from Mrs. Celia F. Holcomb; \$1,000 to the Clarksville Public Library, Clarksville, Iowa, by R. L. Slimmer; a bequest of \$1,000 to the Washington Public Library, Washington, Iowa, by Dr. Ludwig Simon; a \$3,000 bequest to the Lynn Public Library, Lynn, Massachusetts, under the will of Walter O. Faulkner, trustee of the library for over fifty years; a \$2,500 endowment fund to the Public Library, Waupum, Wisconsin, from the estate of Betty Kennedy.

Gifts of money and funds for library building

included \$3,700 from the estate of Lucy Rising Rocks bequeathed to Wyoming, Iowa, to establish and maintain a library; \$4,800 from the A. J. Cross estate bequeathed to Shenandoah, Iowa, to be used with the building fund; \$10,000 left by Mrs. Mattie Utting to Dodgeville, Wisconsin, to help erect a library building. Over \$90,000 left by H. E. Swen to Kahoka, Missouri, for the construction of an H. E. Swen Memorial Library to serve Kahoka and Clarke Counties. And \$25,000 has been given by various donors to Indianola, Mississippi, for a public library. The Baldwin-Wallace College received a gift of \$152,000 from George W. Ritter, an alumnus of the college for the construction of a modern library building.

Plans made for extensive construction of library buildings have been delayed because of the shortage of materials. The next few years will probably see an unprecedented growth in modern library building along the lines of the long range master plan developed by the Detroit Library Commission for that city.

Libraries as war memorials are planned in many communities, some of which have already raised the necessary funds. In Augusta, Georgia, a group of local veterans have taken the leadership, but in most cases, money has been raised by the community at large.

**Publications.** During the past year, in addition to the regular periodicals, *A.L.A. Bulletin*, *Booklist*, *Subscription Books Bulletin*, *College and Research Libraries*, and *Hospital Book Guide*, the A.L.A. Publishing Department issued nine new items; reprinted or arranged to reprint twenty publications; and inaugurated the selling of children's stories on records and the Canadian film, "Library on Wheels." Among the 1946 publications were: *Library Service in Business, Its Place in the Small City*, Marian C. Manley; *College and University Librarians and Librarianship (Library Planning Document in the College Field)*; *Rehabilitation Materials on Today's Problems for Veterans and Civilians*, Mary A. Sweeney; *Insurance of Libraries*, Dorothea M. Singer; *Books for Adult Beginners*, Cincinnati Public Library Staff; *Arsenals of a Democratic Culture: A Social History of the American Public Library Movement in New England and the Middle States, 1850-1900*, Sidney Ditzion.

Among the books in the library field issued by other publishers are: *Books and Libraries in Wartime*, Pierce Butler, University of Chicago Press, 1945; *Library Extension*, University of Chicago Press, 1946; *General Education in a Free Society: Report of the Harvard Committee*, Harvard University Press, 1945; *Fifty Years of Best Sellers*, Alice Payne Hackett, R. R. Bowker, 1945; *Library Extension, Problems and Solutions*, Carleton Joeckel, University of Chicago Press, 1946; *The University Library: Its Organization, Administration and Functions*, Louis R. Round and Maurice F. Tauber, University of Chicago Press, 1945; *Evaluation and Revision of the Library School Curriculum*, Peabody Press, 1945.

MARY C. TUOMEY.

**LIBYA.** An Italian possession in North Africa, conquered by Allied forces under General Montgomery in the winter of 1942-43. Area, 679,358 square miles; population (January 1, 1939) 888,401. Of these 763,179 were Moslems, 30,046 Jews, 89,098 Italians, and 6,078 other Europeans (including many Maltese). By 1943 hardly any Italians remained in Cyrenaica (the eastern part of Libya), while some 38,000 remained in Tripolitania (the western part). Capital, Tripoli.

The Fascist regime divided the country into four coastal provinces—Tripoli, Misurata, Bengasi and Derna—and a Military Territory of the South comprising the very sparsely inhabited desert interior. In 1939 the four provinces were incorporated into the national territory of Italy. However, full citizenship was not awarded to the native population. Various other political, economic, and cultural discriminations were also enforced against the natives and in favor of Italian colonists. Libya is now under British military administration.

By 1939 much of the internal economy and foreign trade of Libya had become artificial as a result of Fascist autarchic policies. The region is devoid of any important natural resources, mineral or otherwise. Only under the impetus of large-scale government-spending programs could Libya's agriculture be made to produce exportable surpluses of cereals, fruits, and vegetables. The colony's foreign trade was largely with Italy, the latter accounting for over 90 percent of both its imports and exports. (See YEAR BOOK for 1943, page 337, for latest available statistics.)

**Events.** One of the most knotty problems taken up by the victorious Powers during 1946 was that of the disposition of Italy's African colonies, notably Libya. The Russians put forward a claim to the sole trusteeship of Tripolitania, but this had been opposed by all the other Great Powers, as well as by Italy and the Arab League. The latter, through its Secretary-General, Abdul Rahman Azam Fasha, declared on April 29 that the Tripolitans, with the aid of the Arab world, would resist by force any effort to place them under Soviet tutelage. Earlier, towards the end of January, the same spokesman had disclosed that the League states were restating, in notes to the Great Powers, their well-known demand that Libya be made independent, and that if any temporary trusteeship were to prove necessary, it should be awarded to the Arab League and not to some "outside" Power or Powers.

The positions of the French was that, if Libya or Tripolitania were to be put under trusteeship, they preferred Italy to either Russia or Great Britain as trustee. The United States wanted all the Italian colonies given their independence after a specified period of collective trusteeship under the United Nations Trusteeship Council. The Italians, of course, insisted that the colonies be returned to them. They pointed out that these possessions had been acquired before Fascism took power and that the Italian people, over several generations, had expended an immense amount of effort, money and blood in order to "civilize" them.

Since the early days of the war the British had been committed against the return of the Senussi—i.e. Cyrenaica—to Italian rule. For a time they had, however, seemed disposed to allow Italy a trusteeship over Tripolitania. Meanwhile, British forces continued in effective control of all three of Italy's African colonies, and London expressed no anxiety to settle the question.

The British position changed in late April after a meeting in London of Dominion representatives. Foreign Secretary Bevin therefore told the Big Four Conference in Paris on April 29 that his government was now in favor of independence for a united Libya and that the treaty provisions for setting up such a state should be made in consultation with the inhabitants of the country.

At the same session Molotov gave details of a Russian proposal for having each Italian colony administered by an advisory commission composed of five members—three from Great Powers and

two from small ones. The chief administrator would be of a different nationality in each case—Russian for Tripolitania—but the deputy administrator would in all cases be an Italian. By May 10 the Soviet delegate was willing to put Libya under a United Nations trusteeship with Italy as administrator. Bevin demurred as far as Cyrenaica was concerned, but agreed for Tripolitania. The United States representative, Secretary of State Byrnes, wanted a definite time limit set on the period of trusteeship.

Bevin's statement of April 29, proposing unity and independence for all of Libya, had met with a welcome response from opinion in that country. When the purport of the May 10 discussions in Paris reached Libya, there was intense disappointment and the British military authorities felt obliged to take measures against the threat of violence on the part of nationalist elements which boldly proclaimed that they would resist to the death any attempt to reimpose Italian rule on them. Inevitably the tribes in the interior grew restive over the continued political uncertainty of the country. A united national front of Tripolitan political parties was formed and two representatives of it were sent to Cairo in order to obtain assistance from the Arab states. At the end of May the conference of Arab rulers meeting in Cairo announced its support of Libyan independence.

On June 20 the Big Four decided to defer solution of the Italian colonial problem for a year. On July 3 they agreed that Italy must renounce title to her African territories and that Britain would continue to administer them until a final settlement had been reached. They also declared that this settlement should be made so as to conform to one, or a combination of several, of the following criteria: (1) independence; (2) incorporation within a neighboring territory; (3) trusteeship under one or all of the United Nations. The Italians threatened that they would never sign a treaty containing such provisions. Nevertheless, the 21-power Luxembourg Conference, which convened later in the summer, substantially approved the recommendations of the Big Four concerning the Italian colonies. During the discussions of the Political and Territorial Committee for Italy on September 25, the British delegate stated that his government was inclined to let Egypt have a strip of Cyrenaica.

While the Great Powers debated over the future of Libya, the politically aware elements in that country organized themselves into groups and carried on propaganda and agitation. In Tripolitania no single personality or family stood out as the inevitable political head. Several potential leaders appeared, such as Salem Bey Muntasser (formerly an adviser of the Italians), Bismir el Saadawi (in exile for over two decades, serving part of that time as counselor to King Ibn Saud), Abdul Rahman Azzam Pasha (secretary-general of the Arab League, also an exile during Fascist rule), Sheikh Abdul Isad al Alim (Mufti of Tripoli), Awni ben Souf (long a rebel against Italian rule and during World War II the head of the Tripolitan Defense Committee in Cairo), and Ahmed Fiki Hassan (president of the Tripolitan Nationalist Party).

In Cyrenaica the long-recognized leader was the Sayed Idriss el Senussi, head of the Senussi order, or sect, which claims millions of adherents in the various Arab lands. The Sayed and his principal advisers had been forced by the Fascist Government to flee the country and had hence spent many years in the Middle East, where they had become closely associated with the Pan Arab move-

ment. They wanted an independent Libya only if its ruler—emir or prince—were to be the Grand Senussi himself. If there must be some sort of dependence on a Great Power, they much preferred Great Britain. It was not certain that some of the more progressive elements in Tripolitania would accept the sort of archaic theocratic regime that Senussi rule denoted.

Meanwhile the British administration had permitted a number of selected native Libyans to enter the civil service in various capacities and thereby gain much-needed experience. However, the consultative assembly was appointed by the British, rather than elected by the people, and the Arabs complained that altogether too many Italian officials, including a number of Fascists, were being kept on in executive and judicial positions where they were enforcing Fascist laws already abandoned in Italy. In Cyrenaica few Italians remained, but there were 38,000 of them in Tripolitania. The farming colonies established by the Fascist Government for Italian settlers in the highlands of Cyrenaica had been taken over by Arabs. Bengazi's population had dropped from 70,000 to 30,000, its harbor was cluttered with the hulks of 67 ships and all around it lay immense piles of rusting war material.

Reports that Britain was building air and naval bases in Cyrenaica to replace those being abandoned in Egypt were shown, according to the observations of neutral visitors, to be unfounded.

ROBERT GALE WOOLBERT.

**LIECHTENSTEIN.** A principality in central Europe, adjoining Switzerland on the east. Area, 62 square miles. Population (1941 census), 11,218. Capital, Vaduz (2,020 inhabitants). Chief products: corn, wine, fruit, wood, marble. Main industries: cotton spinning and weaving, leather goods, pottery, and livestock raising. Liechtenstein belongs to the Swiss Customs Union; Swiss currency is used. Budget estimates (1946): revenue 2,693,760 francs; expenditure 2,809,377 francs. Public debt, December 31, 1945, 2,669,615 francs. Reigning Prince, Francis Joseph II (succeeded Aug. 25, 1938). Head of Government, Alexander Frick (September 3, 1945).

**LITERATURE, American and British.** The year 1946 was a dull year for new writing in English. The promise that seemed to appear in 1945 was not fulfilled; few works broke fresh ground either in form or substance; even the long-established writers failed to contribute much, and vivid new writers were few. To be sure, the patterns that have characterized fiction, poetry, drama, biography, etc., since World War I appeared again, so that it could not be said, "Here and here is failure." The great public could not feel disappointment; it continued to get what it demanded and was accustomed to. But the seeker for brightness, vitality, creativeness would probably be disappointed in 1946.

**Biography.** Biographers, during the year, presented an interesting group of American political figures, such as: *Alexander Hamilton*, by Nathan Schachner; *Lincoln's War Cabinet*, by Burton J. Hendrick; *Old Rough and Ready: the Life and Times of Zachary Taylor*, by Silas Bent McKinley and Silas Bent; *The American* (Gov. Altgeld of Illinois), by Howard Fast; *Brandeis*, by Alpheus Thomas Mason; *The Roosevelt I Knew* (F.D.R.), by Frances Perkins; *As He Saw It*, by Elliot Roosevelt, about his father; *The Wilson Era: Years of War and After, 1917-1923*, by Josephus Daniels, the fourth volume of his autobiography; *The Autobiography of William Allen White*; *James Munroe*,

by W. P. Cresson; *The Selected Writings of John and John Quincy Adams*, edited by Adrienne Koch and William Peden; the mysterious *Diary of a Public Man*, anonymous, used by historians but not previously published, about pre-Civil War events; *Horace Greeley*, by Henry Luther Stoddard; *Alexander H. Stephens*, by Rudolph Von Abele; *General George Crook, His Autobiography*, an Indian and Civil War fighter, edited by Martin F. Schmitt; *The Brereton Diaries*, by General Lewis H. Brereton, about World War II; *Starling of the White House*, reminiscences of a Secret Service man, told to Thomas Sugrue by Edmund W. Starling; and *Public Men In and Out of Office*, edited by J. T. Salter.

Biographies of American literary figures were few. Such were: *Mark Twain, Business Man*, edited by Samuel Charles Webster; *Hubert Howe Bancroft*, by John Walter Caughey; *The Boy I Left Behind Me*, by Stephen Leacock; and *Man and Shadow*, autobiography by Alfred Kreymborg.

But there was the usual fascinating group of miscellaneous Americans. Ellery Sedgwick's *The Happy Profession* was editing. Thomas W. Lamont described *My Boyhood in a Parsonage*, but went beyond his boyhood. Gerald W. Johnson's *An Honorable Titan* was Adolph S. Ochs. *American Daughter*, by Era Bell Thompson, gave a negress between the two races. Lora Wood Hughes, as a nurse, had *No Time for Tears*. Ferris Greenslet pictured *The Lowells and Their Seven Worlds*. Walter L. Howard showed *Luther Burbank* as a victim of American hero-worship. John Rothwell Salter's *Rhees of Rochester* gave a university president; Cornelius Weygandt's *On the Edge of the Evening* was autobiography of an English professor, while Thelma Jones, in *Skinny Angel*, showed the life of a faculty child. Stewart H. Holbrook's *Lost Men of American History* considered the almost forgotten. Hermann Hagedorn's *Americans: a Book of Lives*, included seventeen chosen by poll and was to be distributed abroad. Norman Anthony's *How to Grow Old Disgracefully* and Hildegard Dolson's *We Shook the Family Tree* were each humorous, but in different ways. Lilly Dache's *Talking Through My Hats* was a success story. So was Louise Baker's *Out on a Limb*, about one-leggedness. *Really the Blues*, by Milton Mezzrow and Bernard Wolfe, gave the life of a jazz-player. Roy Meredith's *Mr. Lincoln's Camera Man*, a Civil War photographer. A different war appeared in *My Three Years with Eisenhower*, by Captain Harry C. Butcher. A. J. Hanna's *A Prince in Their Midst* told about Achilles Murat in South Carolina, while H. J. Eckenrode's *The Randolphs* gave a native aristocracy. Gene Fowler's *A Solo in Tom-Toms* and James Montgomery Flagg's *Roses and Buckshot* were written for newspaper readers. American girls as wives of Europeans were described in Mary Mian's *My Country-in-Law* and Eleanor Perenyi's *More Was Lost*. *Burma Surgeon Returns*, by Gordon S. Seagrove, was a sequel to a success. Helen Augur's *Passage to Glory: John Ledyard's America*, told about a wanderer. S. Hurok told Ruth Goode about his troubles with singers and dancers for *Impresario*.

Biographies of British writers included: Hesketh Pearson's *Oscar Wilde*; T. G. Wilson's *Victorian Doctor*, about Oscar Wilde's father; Dame Una Pope-Hennessy's *Charles Dickens*; Aurelia Brooks Harlan's *Owen Meredith*; Margaret R. Grennan's *William Morris: Medievalist and Revolutionary*; Marchette Chute's *Geoffrey Chaucer of England*; Charles Norman's *The Muses' Darling* (Christopher Marlowe); Margaret Cole's *Beatrice Webb*;

Anne B. Fisher's *No More a Stranger*, about Robert Louis Stevenson in California. Living British writers wrote about themselves in: Sir Osbert Sitwell's *The Scarlet Tree*, second volume of his autobiography; Howard Spring's *And Another Thing . . .*; J. B. Yeats' *Letters to His Son, W. B. Yeats, and Others*, edited by Joseph Hone; Siegfried Sassoon's *Siegfried's Journey 1916-1920*, the third, or perhaps the sixth, volume of his autobiography, three having been disguised; Thomas Burke's *Son of London*; Sir Philip Gibbs' *The Pageant of the Years*; William McFee's *In the First Watch*.

*Fanfare for Elizabeth*, by Edith Sitwell, about the Queen's girlhood, was one of the few British political biographies. Others were: *Ambassador on Special Mission*, to Spain, by Sir Samuel Hoare; *Lady Sarah Lennox*, by Edith Bodker Curtis; and *Grooves of Change*, by Viscount Samuel.

Europeans appeared in: Matthew Josephson's *Stendhal*; Ernest J. Simmons' *Leo Tolstoy*; volume iv and last of Ernest Newman's *Life of Richard Wagner*; Harold Lamb's *Alexander of Macedon*; Harrison Brent's *Pauline Bonaparte*; Gertrude Marvin Williams' *Priestess of the Occult*; *Madame Blavatsky*.

Asiatics and Africans were to be found in: *Man-Eaters of Kumaon*, by Jim Corbett; *Raffles of Singapore*, by Emily Hahn; *Sun Yat-sen*, by Stephen Chen and Robert Payne; *The Mahatma and the World*, about Gandhi, by Krishnalal Shridharani; *The Messenger: the Life of Mohammed*, by R. V. C. Bodley; *A House in Bali*, by Colin McPhee; *America Is in the Heart*, by Carlos Balusan, and *My Africa*, by Mbonu Ojike.

**Criticism and the History of Literature.** Dramatists were studied in Eric Bentley's *The Playwright as Thinker*, about modern drama; in John Palmer's *Political Characters of Shakespeare*; in Harley Granville-Barker's *Prefaces to Shakespeare, Fourth Series*, about *Othello*; in Allardyce Nicoll's *A History of Late Nineteenth Century Drama, 1850-1900*; in G.B.S. 90, edited by S. Winsten, in celebration of Mr. Shaw's birthday. About the poets: Mark Schorer's *William Blake* received high praise. Mark van Doren's *The Noble Voice* considered ten long poems. C. M. Bowra's *From Virgil to Milton* dealt with epics. Marjorie Hope Nicolson's *Newton Demands the Muse* showed the influence of his *Opticks* on poetry. Horace Gregory and Marya Zaturenska published *A History of American Poetry 1900-1940*. Wallace Fowlie dealt with *Rimbaud*. Gay Wilson Allen published *Walt Whitman Handbook*.

Lord David Cecil's *Hardy the Novelist* was impressive as fiction criticism. In that field were also George Orwell's *Dickens, Dali and Others*, and Janko Lavrin's *Tolstoy: an Approach*. In aesthetics appeared Stephen Coburn Pepper's *The Basis of Criticism in the Arts*. Frederick J. Hoffman, Charles Allen, and Carolyn F. Ulrich gave the history of *The Little Magazine*.

**Drama.** Eugene O'Neill's first play since 1934, *The Iceman Cometh*, confusingly attacked illusions. *The State of the Union*, by Howard Lindsay and Russel Crouse, won the Pulitzer Prize by showing a "liberal" Republican candidate for President. Also on the liberal side were Arnaud D'Usseau and James Gow's *Deep Are the Roots*, attacking racial prejudice, Carson Kanin's *Born Yesterday*, the amusing enlightenment of a gangster's girl, and Edward Chodorov's *Decision*. Elmer Rice's *Dream Girl* suffered from narcissism. Sean O'Casey was poetic and dull in *Oak Leaves and Lavender*. John Van Druten argued adultery pro and con in *The Mermaids Singing*. Domestic imbroglia appeared

also in George Kelly's *The Deep Mrs. Sykes*. J. P. Marquand and G. S. Kaufman satirized Boston in *The Late George Apley*. The Enoch Arden theme appeared in Daphne du Maurier's *The Years Between*. *Dunnigan's Daughter*, by S. N. Behrman, had a power-mad father. The preface to Irwin Shaw's *The Assassin* powerfully attacked the New York critics. Also notable were: Emlyn Williams' *Spring, 1600*; Tennessee Williams and Donald Windham's *You Touched Me*; Kenyon Nicholson and Charles Robinson's *Apple of His Eye*, about an old man's love; Harry Brown's war play *The Sound of Hunting*; Joseph Fields and Jerome Chodorov's *The French Touch*; Elsa Shelley's *Pick-up Girl*; and Millard Lampell's radio plays, *The Long Way Home*, about wounded soldiers.

**Essays.** The war was reflected in Lewis Mumford's *Values for Survival*; in John Dos Passos' *Tour of Duty*; in Max Shulman's *The Zebra Derby*, humor about veterans becoming civilians; in Gertrude Stein's *Brewsie and Willie*. Carl Van Vechten edited *Selected Writings of Gertrude Stein*, in addition. Eleanor Roosevelt's *If You Ask Me* was answers to questions from the public. Sir Max Beer-bohm's *Mainly on the Air* showed his habitual polish, though the pieces were broadcast. Earnest Elmo Calkins' *"And Hearing Not"* dealt with deafness and other topics. *An American Year*, by Hal Borland, provided an essay a month. Frank Sullivan, with *A Rock in Every Snowball*, and S. J. Perelman, with *Keep It Crisp*, provided humor. John Mason Brown's *Seeing Things* was largely concerned with drama. Robert van Gelder interviewed successful authors to publish *Writers and Writing*. Titles clearly indicate contents in *A Naturalist's Scrapbook*, by Thomas Barbour, and *Campus versus Classroom*, by Burges Johnson. Graham Hutton, an Englishman, described *Midwest at Noon*. J. Donald Adams edited *The Treasure Chest*, contemplative prose, and Walter de la Mare an anthology of poetry and prose about *Love*.

**Fiction.** It was perhaps characteristic of 1946 that the outstanding novels of the year should be satirical. Frederic Wakeman's *The Hucksters* attacked the advertising business; George Orwell's *Animal Farm* attacked the Communist state; Helen Howe's *We Happy Few* made fun of Harvard intellectuals. Perhaps Donald A. Stauffer's *The Saint and the Hunchback* had its satirical leanings, too; it was laid in the seventh century, however, and considered the problem how to be good. C. S. Lewis, the Christian propagandist, published two fantasies, *That Hideous Strength*, about some strange doings at an English college, and *The Great Divorce*, between Heaven and Hell. Robert Graves, however, in *King Jesus*, revised the biography as known through the ages.

A surprise appeared in Theodore Dreiser's last book, *The Bulwark*, which showed a Quaker suffering like Job. Gladys Schmitt rewrote another old story in *David the King*.

More contemporary, even topical, were such novels as J. B. Priestley's *Bright Day*, about a man trying to be young again; Ethel Vance's *Winter Meeting*, the love affair of a New England woman and a would-be priest; Charles Jackson's *The Fall of Valor*, a man struggling against homosexuality; John P. Marquand's *B.F.'s Daughter*, rich people caught in the war; Robert Penn Warren's *All the King's Men*, which he had to deny was about Huey Long; Upton Sinclair's *A World to Win*, number seven in the Lanny Budd series; Mazo de la Roche's *Return to Jalna*, number ten in the White-oaks series; James T. Farrell's *Bernard Clare*, about a would-be writer; Frederic Prokosch's *The Idols*.

of the Cave, about a man in love with a ballet-dancer; Margery Sharp's *Britannia Meus*, London's Bohemia; William Saroyan's *The Adventures of Wesley Jackson*, his usual message but this time with an army background; Kenneth Fearing's *The Big Clock*, an unusual detective story; and Bruce Marshall's *Yellow Tapers for Paris*, set before 1940, and with a Christian slant.

Strange backgrounds appeared in such novels as Pearl Buck's *Pavilion of Women*, life among rich Chinese; Rumer Godden's *The River*, a small girl in India; Sholem Asch's *East River*, the Jewish community; Michael Sadleir's *Forlorn Sunset*, about the London underworld of the '60's and '70's; George R. Stewart's *Man: an Autobiography*, which fictionized anthropology; Waldo Frank's *Island in the Atlantic*, a novel of long philosophical reach.

The usual goodly crop of historical novels included: *Lord Hornblower*, by C. S. Forester, the fifth of the series; *The King's General*, by Daphne du Maurier, the old hokum; *Then and Now*, by W. Somerset Maugham, about Machiavelli; *Land*, by Liam O'Flaherty, about Ireland's troubles in the 1880's; James M. Cain's *Past All Dishonor*, Virginia City in the 1860's; Richard Aldington's *The Romance of Casanova*, who had only one real love, of course; Kate O'Brien's *For One Sweet Grape*, about Philip II of Spain and a great lady; *Holdfast Gaines*, by Odell Shepard and Willard Shepard, the U.S. just after the Revolution; Conrad Richter's *The Fields*, American frontier life about 1850; T. Morris Longstreth's *Two Rivers Meet in Concord*, about the great days of the Concord group.

Though the influence of the war was pervasive, it had brought forth few good novels by the end of 1946. But these deserve mention: *Mr. Roberts*, by Thomas Heggen, about the non-combatant navy; *Ward Twenty*, by James Warner Bellah, about war cripples; *Horned Pigeon*, by George Millar, a prisoner of war escapes; C. B. Stern's *The Reasonable Shores*, a British family during the war; *Day of the Conquerors*, by Niven Busch, V-J Day; *Of Many Men*, by James Aldridge, an attempt at a panorama of World War II.

The war gave rise to some impressive first novels, such as: Basil Heatter's *The Dim View*, a PT skipper; Robert Lowry's *Casualty*, full of hatred of war and officers; Gore Vidal's *Williwaw*, set in the Aleutians; Wesley Towner's *The Liberators*, occupying Germany. Other first novels, probably better than the war ones, included: Raoul C. Faure's *The Spear in the Sand*, a man in complete solitude; Morrison Wood's *The Devil Is a Lonely Man*, the ruthless Hero; Arkady Leokum's *Please Send Me, Absolutely Free*, and Fieldon Farrington's *The Big Noise*, both attacks on advertising, like *The Hucksters*, mentioned above; Ann Petry's *The Street*, about Harlem; Robert Emmett Higginbotham's *Wine for My Brothers*, an allegory of the fight for freedom, set on a tanker during the war.

Carson McCullers' *The Member of the Wedding* was about a twelve-year-old girl. P. G. Wodehouse resumed publishing with *Joy in the Morning*. Jerome Weidman satirized the OWI in *Too Early to Tell*. Elizabeth Metzger Howard's *Before the Sun Goes Down* won a big prize. T. H. White's *Mistress Masham's Repose* was about Lilliputians. Francis Steegmuller satirized the church in *States of Grace*. Eccentric English people appeared in Nancy Mitford's *Pursuit of Love*.

Only in short-story volumes could 1946 claim achievement superior to other years. The influence of *The New Yorker* magazine, strong for many years, was felt particularly this year, in such books

as: Irwin Shaw's *Act of Faith*, war stories; Emily Hahn's *Hong Kong Holiday*; during Japanese occupation; John McNulty's *Third Avenue*, New York, barroom stories; Elizabeth Parsons' *An Afternoon*, about young, immature women; Edward Newhouse's *The Iron Chain*, again about war; Victoria Lincoln's *The Wind at My Back*, about adolescence and marriage; Francis Steegmuller's *French Follies and Other Stories*. Not all the stories in all these books first appeared in *The New Yorker*, but they all showed the firm writing and the subtitled emotion that magazine demanded. *The Pleasure Was Mine*, by James Reid Parker, and *Here's O'Hara*, by John O'Hara, might also be added to that list.

*Memoirs of Hecate County*, by Edmund Wilson, was charged with obscenity in many parts of the country. Elizabeth Bowen's *Ivy Grippled the Steps* dealt with the English in war time. Jesse Stuart's *Foretaste of Glory* showed a small town approaching Judgment Day. George and Helen Papashvily told *Yes and No Stories*, folk tales from the Russian Georgia. Paul Green's *Salvation on a String* dealt with the country around Raleigh, North Carolina, while John Bennett's *The Doctor to the Dead* had to do with Charleston, South Carolina. Anna Kavan's *Asylum Piece* described mental break-up. Kay Boyle published *Thirty Stories*, all kinds. Paul Gallico's *Confessions of a Story Writer* showed his journalistic skill. Roald Dahl's *Over to You* was about fighter pilots. August Derleth anthologized ghost stories in *Who Knocked?* James T. Farrell's *When Boyhood Dreams Come True* disappointed his admirers. An anthology of science-fiction was edited by Raymond J. Healy and J. Francis McComas, *Adventures in Time and Space*. In *American Legend*, Robert and Dorothy van Gelder collected short stories and selections from novels to show the spirit of America.

**History.** No peaks of achievement marked 1946 in history. A picture book was perhaps as remarkable as any: *The New World: the First Pictorial Report on America*, paintings made by John White and Jacques Le Moyne in the sixteenth century, edited by Stefan Lorant. Volume iii of *Album of American History*, edited by James Truslow Adams, covered the years 1853-1893, also in pictures. Volumes i and ii, 1806-1865, of *The Economic Mind in American Civilization*, by Joseph Dorfman, were thorough and detached. Clifford Dowdley's *Experiment in Rebellion* provided a Southern history of the Civil War, while Alfred Hoyt Bill's *The Beleaguered City* concentrated on Richmond between 1861 and 1865. Neil H. Swanson likewise described Baltimore during the War of 1812 in *The Perilous Fight*. No war, but political and social struggle marked Wayne Andrews' *Battle for Chicago*. Frank C. Hibben went back into pre-history to find *The Lost Americans*.

American regional history continued in such books as Walter Havighurst's *Land of Promise: the Story of the Northwest Territory*, or Alvin F. Harlow's *Steelways of New England*. Water provided the center for most regional histories, however; from the *Rivers of America* series: volume i of *The Tennessee*, by Donald Davidson; *The Housatonic: Puritan River*, by Chard Powers Smith; *River of the Sun*, the Gila, by Ross Calvin; *The Colorado*, by Frank Waters; and in the *American Lakes* series: W. Adolphe Roberts' *Lake Pontchartrain*, and Frederick F. Van de Water's *Lake Champlain and Lake George*. Water also appeared in Donald W. Mitchell's *History of the Modern American Navy*, since 1883.

Books about World War II multiplied. A cartoon

history by David Low, with text by Quincy Howe, was *Years of Wrath 1931-1945*. Walter Phelps Hall attempted interpretation of the war in *Iron out of Calvary*. The effects of the atom bomb were vividly described in John Hersey's *Hiroshima*. Gilbert Cant explained *The Great Pacific Victory*, and Fletcher Pratt's *Night Work* was about naval task force 39. Walter Millis' *The Last Phase* considered the war in Europe from D-day to VE-day. Ross Munro, in *Gauntlet to Overlord*, told of Canada's military effort. Charles A. Beard disapproved of *American Foreign Policy in the Making, 1932-1940*. Justice Robert H. Jackson's opening statement at the Nuremberg trial was published as *The Case against the Nazi War Criminals*.

In European history appeared: *The Great Retreat*, by Nicholas S. Timasheff, about Russia since 1914; *Imperial Commonwealth*, by Lord Elton, about the British Empire; *Suitors and Suppliants*, by Stephen Bonsal, behind the scenes at Versailles in 1919; *The Weimar Republic*, by Godfrey Schecle; *The Congress of Vienna*, by Harold Nicolson, discussing Allied unity between 1812 and 1822.

Other noteworthy histories were: *Botha, Smuts, and South Africa*, by Basil Williams; *The Discovery of Canada*, by Lawrence J. Burpee; and *Women as Force in History*, by Mary R. Beard.

**Poetry.** Poets of large reputation did not publish in 1946, though plenty of poetry was published. A few newcomers attracted attention: Alice Monks Mears' *Brief Enterprise* won a prize; Howard Moss' *The Wound and the Weather* and Lysander Kemp's *The Northern Stranger* won praise. Robert Lowell, of a famous family, mixed traditional religion and fresh diction in *Lord Weary's Castle*, his second volume. Thomas Merton's second volume, *A Man in the Divided Sea*, likewise was Roman Catholic in inspiration. The war as topic and influence appeared in H.D.'s *The Flowering of the Rod*; in John Waller's *Crusade*; in Hermann Hagedorn's *The Bomb that Fell on America*; in Robert Tallman's *Doomsday's Cue*. T. W. Ramsey's *Fire and Ice* was philosophical. Robert P. Tristram Coffin's *People Behave Like Ballads* was largely narrative. Elizabeth Bishop's *North & South* won a prize. Kenneth Porter's *No Rain from These Clouds* included his work since 1927. Genevieve Taggard published *Slow Music*, while Leonora Speyer published *Slow Wall*. Phyllis McGinley's *Stones from a Glass House* was light, and Frances Frost's *Mid-Century* was not too heavy. Other works that drew attention were: Eve Merriam's *Family Circle*; John Buxton's *Atropos*; Nancy Bruff's *My Talon in Your Heart*; Ruth Pittner's *The Bridge*; Oliver St. John Gogarty's *Perennial*; Josephine Miles' *Local Measures*; Frank Kendon's *The Time Piece*; Norman Rosten's *The Big Road*; Roy Helton's *Come Back to Earth*; Brewster Chiselin's *Against the Circle*; Margaret Staveland's *Doors to a Narrow House*. Alfred Noyes edited *The Golden Book of Catholic Poetry*.

BENFIELD PRESSEY.

**LIVING COSTS AND STANDARDS IN 1946.** For the average consumer, 1946, like 1945, was a year more of promise than of fulfillment. Incomes were high as the average worker's take-home pay, which had dropped rather sharply after V-J Day, mounted slowly and finally surpassed July 1945 levels. Sharply rising prices during the latter part of the year, however, more than offset advances in wages, so that the worker found it more and more difficult to maintain his previous level of living. Shortages of goods—both durable items not available

during the war and nondurable goods such as foods and clothing—continued to be of paramount importance. The average family was less aware that the economy was operating at a full-employment level than that meat was not available in butcher shops and that a 12 or 18 months waiting period was required to get an automobile.

By the third quarter of 1946, production of many goods was at an all-time high. The Federal Reserve Board's index of industrial production reached a peacetime peak. Production of washing machines, vacuum cleaners, electric ranges, gas ranges, radios, and electric irons exceeded 1941 rates, although output of some goods such as sewing machines and passenger automobiles still lagged.

The anomaly of high-level output coincident with inadequate supplies which characterized 1946 arose from a number of causes. In the first place, demand, buoyed by high incomes, a loosening of regulations on consumer credit, and the non-availability of hard goods during the war was at extraordinary levels, in many cases exceeding the capacity of the industrial plant. Further, output was not as great as might have been anticipated from the level of employment because of production bottlenecks. Thus, shortages of steel, lead, copper, and other industrial raw materials made it difficult for plants to operate at high rates over long periods and materially raised the cost of those goods which were produced.

Consumer expenditures in terms both of dollar value and physical volume rose substantially in 1946 over the high 1945 level. By the third quarter of 1946, consumer expenditures were running at an annual rate of more than 125 billion dollars, but change was taking place in the purchase pattern. As more durable goods became available, purchases of these types of equipment rose sharply to nearly double the 1943-44 rates. Purchases of nondurable goods, such as foods and textiles, apparently had reached a plateau by late 1946, and there was some question as to whether sales of soft goods would continue at high levels when hard goods became more readily available.

The rise in consumer expenditures was backed by a substantial rise in workers' take-home pay from the level of late 1945. Thus, by October 1946 average gross weekly earnings in manufacturing industries were \$45.83, almost \$5 above a year earlier. This rise represented the net effect of a sharp increase in hourly earnings (which averaged \$1.13 in October 1946) and a decline in the work week. Despite this substantial rise, however, earnings in 1946 still had not regained the January 1945 peak. Further, the purchasing power of this increased take-home pay was reduced by sharp advances in prices, particularly after the serious weakening of price controls in midyear.

In June 1946 the Congress passed and sent to the President a sharply amended price control extension act which was vetoed on the grounds that it "legalized inflation." It was not until late July that Congress passed a new version of the price control act which met with the President's approval. This version differed sharply from that in effect prior to the end of June. Authority for price control over farm products was withdrawn from the OPA Administrator and delegated to the Secretary of Agriculture. A Price Decontrol Board was established as a final authority over prices of both agricultural and nonagricultural commodities. A number of important materials, including grain, petroleum and products, tobacco and products, and dairy products and meats, were temporarily decontrolled, subject to action by the Decontrol

Board. Meats were returned to price control late in August, but a serious shortage developed and price controls were removed again in October. With this "breaking of the line" on meats, decontrol for other commodities followed rapidly. By the end of October almost all foodstuffs were free from price control and by mid-November only rice, sugar, and rents remained under OPA authority. Sugar, the only commodity still under rationing, was expected to be in short supply through 1947.

The rise in consumers' prices in 1946 was led by foods, which advanced about 31 percent, followed by housefurnishings (up 19 percent) and clothing (18 percent). More moderate advances were recorded for miscellaneous goods and services (about 9 percent) and fuel, electricity and ice (5 percent). As in immediately preceding years, rents were generally unchanged.

Prices paid by consumers advanced in each quarter of 1946, although the rate of advance varied sharply in different periods. Prices rose less than  $\frac{1}{2}$  of 1 percent a month during the first half of 1946, while OPA controls were still effective. However, during the price control "holiday" in July and the period of weakened price controls which followed, average consumers' prices rose nearly 10 percent in three months. In part, the July increases reflected price adjustments previously allowed by OPA, particularly for manufactured goods. Advances continued at a somewhat slower rate through the rest of the year.

The most rapid advance in food prices occurred with the lapse of OPA control at the end of June. Sharpest advances were reported for meats and butter which had been in short supplies in preceding months. Substantial advances also occurred for sugar, coffee, and tea, as foreign producers raised their prices for these imported foodstuffs.

Despite apparent shortages of many foods relative to demand, the average family ate very well in 1946. On the average, per capita consumption of foods was more than 6 percent higher than consumption in the relatively prosperous year of 1941. Per capita consumption of fluid milk was more than 20 percent higher and consumers ate more eggs, canned vegetables, cheese, ice cream, fresh vegetables, and coffee than in 1941. Even consumption of meats was higher despite the apparently severe shortages in 1946. The high consumption of fluid milk, however, impinged upon supplies for butter making, so that consumption of butter was only about 60 percent of the 1941 rate. Other foods for which consumption was less than before the war included refined sugar, fresh and canned fruits, and wheat flour.

In a number of cases shortages of foods were local rather than national and reflected transportation difficulties. Thus, during the summer, refined sugar generally was unavailable in eastern states, although western retailers had ample supplies on their shelves. Similarly, distribution of the very high output of corn syrup was hampered by a lack of box cars.

Prices for clothing, after food the most important group of commodities in the consumer's budget, continued to advance at a rate of about 1 percent a month during the year. Production of women's clothing generally exceeded all previous peaks, but output of men's clothing continued to be hampered by labor and materials shortages. By the end of the year, many types of clothing of prewar qualities again were generally available, but at prices far higher than prewar. High rates of textile production led to belief in the trade that

the boom was over and that sharp breaks were imminent. The average consumer saw little evidence on retailers' shelves of over-production of desirable goods. There were a few bright spots, however, Nylon stockings almost unavailable in 1945, were quite plentiful by late 1946. Men's wool suits were available in increasing numbers in the fall, but demand was still so high that retailers were unable to keep large selections on hand.

The most serious shortage in the apparel field at the end of 1946 was in shoes. This shortage reflected in part the small supply of leather arising from the meat shortage of earlier months when the number of animals moving through regular slaughtering channels was sharply reduced. It was generally anticipated that shoes of desirable quality would continue in short supply well into 1947. Retail prices of shoes, particularly in the lower brackets, moved up sharply with the elimination of price control in the latter part of the year.

As in previous years, residential rents, still tightly controlled, were generally stable during the year. Sales prices of houses, however, continued to advance sharply. There were reports late in the year that the "bloom" was off the market for older houses, as the end of the postwar migration eliminated the "frantic fringe" of house buyers. Those persons still in the market apparently were becoming more selective and less willing to pay a large premium for immediate occupancy. Thus, some realtors reported that it required two and three months instead of two weeks to sell the average house.

The governmental housing program, which had concentrated on providing homes for veterans, had not proceeded as rapidly as had been hoped. While the number of new homes started moved up sharply in 1946, the number of completed homes was low. In mid-December many of the restrictions on construction were dropped.

Shortages of materials such as iron pipe and cast iron plumbing fixtures extended the average time of construction from a normal 2 to 4 months to 6 and 7 months or more. Because of shortages it also was necessary for builders to secure materials from sources other than those normally used, substantially raising the cost of the average house completed in 1946. The low rate of house completion and the small number of rental dwellings started were reflected in the rental market. Approximately three-quarters of the residential dwellings started under the government program were for sale rather than rent. Desirable house or apartments generally were not available for rental in most cities. Most large housing projects had long waiting lists which they did not expect to be able to service for many months, and many discontinued the practice of adding names to waiting lists.

With the elimination of most price controls, agitation for the elimination or moderation of rent controls increased. Realtor groups generally asked either the elimination of most rent controls or a 10 to 15 percent increase in rents, pointing to the sharp rise in prices of most goods at a time when rents had remained virtually unchanged. Government control agencies, however, continued to refuse requests for a blanket increase in rents, pointing out that realtors' profits had risen over 1939 because of the elimination of vacancy expenses, the reduction of repairs and alterations, and effective declines in the quality of service.

In an acceleration of the trend of earlier years, rates for gas and electricity dropped 2 percent during 1946. Prices of coal and petroleum fuels, however, moved up during the year. Coal prices

rose about 7 percent in June to cover higher wages granted miners following a 59-day strike. A second coal strike late in the year lowered stockpiles and hard-fuel supplies promised to be as tight during the winter of 1946-1947 as during the war.

Housefurnishing costs to the average consumer increased 19 percent during the year with higher prices for both textile housefurnishings and durable goods. Prewar qualities of textile housefurnishings such as sheets, pillowcases, draperies and upholstery fabrics were available only in the higher price lines. Durable goods, such as refrigerators, washing machines, vacuum cleaners and ranges, generally were available by the end of the year, although not always for immediate delivery. By October, the supply of table radios and electric irons was so large that clearance sales were started by retail organizations throughout the country, particularly for models produced by new or unknown organizations. Prices for standard brand radios and irons remained stable. Large console radios were available in increasing quantities. Short supplies of lumber limited the number of cabinets which could be made, so that larger radios still were not being produced in quantities sufficient to meet demand.

Consumers' services continued to move up in cost during the year at about the same rate as in earlier periods. Following the elimination of price control, many laundries raised prices to cover higher costs. Haircuts rose to a dollar in some places and cost of medical care continued to inch forward.

Automobiles again were available to civilians in 1946 but in quantities far smaller than demand. Retail prices of new automobiles were some 50 percent higher than in 1939, but, even with the increased price, the average individual who wanted an automobile was forced to make a deposit and take his place far down on a waiting list. With the elimination of price control, market prices of used automobiles jumped sharply, rising in some cases to more than the established retail price set by manufacturers for new cars.

At the end of the year more and more organizations predicted the approach of a business downturn. In part, this reflected substantial weakness in the stock market which had fallen sharply during the summer months and failed to recover by the end of the year. In part, it reflected fears rising from growing stocks of many goods which could become excessive if demand were to decline and, in part, it represented a recognition of the fact that readjustments of the price structure were inevitable. The average business forecaster predicted a downturn beginning possibly in the second part of 1947. It was not generally anticipated that the downturn would be severe, but it was expected that once begun it would last at least until 1948. The President's Council of Economic Advisers, however, in a year-end report anticipated continuing business prosperity in 1947 on the basis of existing favorable factors.

In the late months of 1946, however, there was no evidence that the downturn had begun. Retail sales continued well above the levels of the year earlier. Christmas buying was at an all-time high as many families bought radios, electric appliances and good quality clothing which had not been available during the war period.

Factors that indicated that a decline might come were the sharp rises during the summer in food costs which had undoubtedly reduced funds for durable goods and required a general tightening of the average family budget. There also was little

doubt that consumers were becoming more selective. There was, however no indication of refusal on the part of consumers to buy high quality merchandise at prices far in excess of prewar levels.

GALEN B. PRICE.

**LUTHERAN CHURCH.** The Lutheran Church in America continued to show a steady growth. Membership totals in the United States and Canada were: baptized members, 5,875,409; confirmed members, 4,046,444; organized congregations, 19,405; ordained ministers, 13,953. Total receipts during 1944 were \$104,246,791, of which \$73,357,078 was for local expense and \$30,889,713 for benevolences. A slight increase was recorded in the enrollment of Sunday and weekday schools, checking a downward trend begun in 1940.

All Lutheran bodies are included in the above total, some of them with their roots going back into the State churches of the mother countries in Europe. They have continued to experience a desire to work together in closer fellowship looking forward to the possibility of eventual unity. Eight of the bodies cooperating in the National Lutheran Council, comprising about two thirds of the Lutherans of America, continued their cooperative activity under the Council's revised constitution, through which they have opened up larger channels of work in the fields of American missions, welfare, student work, and public relations. Noteworthy was the new development of the work resulting from the end of the war.

A three-way program to discharged men and women was inaugurated:

(1) The ministry of 85 clergy to hospitalized cases in the Veterans' Administration care. (2) The increased personnel and developed program for serving the more than 100,000 Lutheran students on university and college campuses, the larger part being returned veterans. (3) The service to families and individuals in housing areas through a special church program and lay workers arrangement.

The Lutheran Churches in America have raised more than 20 million dollars for reconstruction and relief in the war-torn countries. The spread of famine, the opening of countries to relief work and the need for communication has led to sending several commissioners to work in Lutheran reconstruction projects: Dr. S. C. Michelfelder; Dr. Clifford A. Nelson; Rev. Herman Keiter; Rev. Owen Norem; Rev. Carl Schaffnit. The last two are attached to CRALOG. Early in 1945, the Lutheran World Relief, Inc., was organized to facilitate shipment of supplies, food and clothing, to needy people in the world. More than 2,843,000 pounds of goods have been shipped. All Lutheran bodies have participated in this project.

The reorganization of the Lutheran World Federation, formerly known as the Lutheran World Convention, was completed at Uppsala, Sweden, July, 1946. Dr. S. C. Michelfelder was called as the executive secretary to this organization to direct the relief program and arrange for the first general conference in Lund, Sweden, in June, 1947. Dr. Daniel Nelson is the representative in the Orient with headquarters in China, where an expanded program is now being planned.

In the Synodical Conference, which makes up the remaining third of American Lutheranism, the Missouri Synod alone collected over \$5,500,000 as a special Peace Thank Offering in 1945, to be used for reconstruction in devastated areas, an educational building program and home missions. The Lutheran Hour, a worldwide religious broadcast featuring Dr. Walter A. Maier, professor at Con-

cordia Theological Seminary, St. Louis, Missouri, reached a new high during 1945 in the number of broadcasting stations employed and nations served. Seven hundred and eighteen broadcasting stations under 23 different flags carried the Lutheran Hour, resulting in mail from 59 different countries. One hundred ninety-seven theological students entered the ministry of the Lutheran Church, Missouri Synod, in 1945.

**LUXEMBURG.** A grand duchy in western Europe; under occupation by German armed forces from May 10, 1940, until liberated by Allied armed forces late in 1944. Area: 999 square miles. Population (Jan. 1, 1940, estimate): 801,000. Capital: Luxemburg. Agriculture was the occupation of 32 percent of the people. Oats and potatoes were the chief crops. Livestock (1939): 154,727 pigs, 107,417 cattle, 18,017 horses, 8,465 sheep, and 3,107 goats. The mining and metallurgical industries are the most important. In 1939 the output of pig-iron and ferro-alloys totaled 1,776,000 metric tons, steel ingots and castings 1,824,000 metric tons. In 1938 there were 35 blast furnaces and 7 steel works in operation. The budget for 1946 indicated revenue of 2,219,570 francs and expenditure of 3,666,597 francs. Public debt (Jan. 1, 1945): 807,730,302 francs.

**Events.** The Cabinet of the Grand Duchy continued to be headed during 1946 by Prime Minister Pierre Dupong of the Christian Socialist Party. Joseph Bech of the same party, who had served as Prime Minister from 1926 to 1937, completed his twentieth year as Foreign Minister and headed the Luxemburg delegation to the United Nations General Assembly. Guill Konsbruck, Minister of Economic Affairs, was replaced by Lambat Schaus, both of the Christian Socialists. Upon the death of Charles Marx, Communist Minister of Social Welfare, he was replaced by Dominique Urbany, also a Communist. Early in August Albert Winthert, a Socialist schoolmaster who had been a resistance leader under the Nazis, was arrested along with Lieuts. Krieps and Winter for participation in an alleged plot to overthrow the Government, motivated by dissatisfaction with the Cabinet's tardiness in eliminating pro-Nazis from public office. Dupong dismissed the episode as "a comic opera revolution."

On November 1 Hugues le Gallais, Minister in Washington, joined his two diplomatic colleagues in asking the Big Four that Luxemburg, Belgium and the Netherlands be represented "from the beginning" in discussions of the German peace treaty. France was sympathetic, but Great Britain, the United States and the U.S.S.R. were noncommittal. Following the example of her northern neighbors, Luxemburg on November 8 submitted to the Council of Foreign Ministers a claim for a narrow strip of German territory, comprising some 235 square miles. These issues were still unresolved at the close of the year.

Meanwhile, in mid-October 75 delegates from 37 organizations in 14 countries met in Luxemburg in the first International Conference of Federalists. The British delegates included three members of Parliament. American representatives included Georgia Lloyd, director of the Campaign for World Government; Tom O. Griessemer, director of World Federalists, who was elected temporary international secretary; Emery Reeves; and Max Habicht, Swiss-American international lawyer. At the close of a three-day session, the delegates unanimously adopted the following resolution (October 16):

"Recognizing that all peoples in all the lands desire peace, we Federalists from various parts of the world, meeting in Luxemburg in October, 1946, have decided to and do now bring into being an International Association uniting all organizations which seek the creation of a World Federal Government. Many of us advocate, as a step towards this end, the formation of Regional Federal Unions, and in particular the United States of Europe. The new association shall be known as the 'Movement for World Federal Government'; its permanent seat shall be on the European Continent and it shall have branches in every country. Conscious of the increasing perils which threaten mankind and of the functional incompetence of the Sovereign State to solve our difficulties, we appeal to men and women everywhere to join with us in our great campaign for the creation of a World Federal Government embracing all the peoples of the globe."

FREDERICK L. SCHUMAN.

**MACHINE BUILDING.** As was to be expected, the trend in machine design and building and in all mechanisms which play a part in modern production, has been toward reducing the amount of hand labor necessary in quantity production of consumer goods. This trend extends from large machine tools to gages and other instruments used in the inspection of finished work.

Electronic control of speeds in machine tools has become fairly common practice. Utilizing some of the discoveries made in the radio field, and using similar electronic tubes, motor speeds can now be varied as desired without the use of gearing or other mechanical devices for controlling the various speeds. The new method is much more simple and efficient and has wider applications than any other method we have known to date. Similarly electronics are now being used for the remote control of small motors which form part of the power plant of machines of various kinds.

Many new machine tools are being placed on the market, most of which have been developed to secure greater efficiency than those of pre-war production. There is less trend toward what was known as streamlined design. This was carried to such extremes in some cases that some grinding machines looked more like a console radio for the parlor than a production machine tool for the shop. While these designs were more attractive to the eye than some of the older machines, in too many cases, the smooth appearance was secured at the expense of accessibility of some of the working parts, both for inspection and repair.

This was particularly true of the placing of electric motors and their control panels so as not to mar the smooth exterior, which was the aim of too many designers. This led to some of the large users of machine tools, notably the large automobile manufacturers, making specifications of their own regarding the placing of this equipment where it was more accessible than in some of the streamlined machines. This has made all the more desirable the increasing use of electronic controls previously mentioned.

Among the developments in the machine tool line are new machines for producing bevel gears by the use of large rotary cutters in an entirely new manner and at surprising speeds, by the Gleason Works. This company has also developed a new type of bevel gear tooth known as the "coniflex" which gives much more latitude, or flexibility in the mounting of mating gears. This provides a localized tooth bearing which can be shifted appreciably without dangerous concentration of load at the ends of the teeth.

Builders of Fellows gear-shaping machines have also developed their type of gear-cutting machine in order to secure much larger production where gears are made in sufficient quantities. This is a marked departure from former practice. Now four,

six, or eight stacks of gears can be located around a central tool head so that all the gears are cut at the same setting. They also have a new and greatly improved machine for testing the accuracy of gear teeth as to the spacing, tooth form, and size.

The use of both air and hydraulics to control tool movement has also been extended to other fields. Although several types of equipment for this purpose were built during the war, in order to make possible the use of standard machines, instead of the highly special types with automatic control for various movements, several builders have now adopted these methods for control in turning contours on their lathes.

Another development along somewhat similar lines is the use of the electric eye as a means of guiding tools along desired patterns. This is being used both for special machining operations and for guiding a cutting torch so as to produce accurate shapes in metal being cut in this manner.

The Bullard Company has extended the use of their Man-Au-Trol device, originally designed for boring mills, to radial and other drilling and boring machines, in order to automatically locate holes in any piece of work without the use of jigs, fixtures, or measurements of any kind. Once the desired pattern of holes is set up on the control board, the positioning of work, or of the tool, is done automatically. After the completion of the first hole, the location of the second hole is found automatically without measurement by an operator.

Using this same controlling device they build a lathe for turning shafting of any kind, such as shafts for electric motor armatures, with each diameter of its proper size and length. Both the diameters and the location of the collars or shoulders, are automatically controlled by the same device. These lathes can be built with two or more spindles so that a similar shaft can be turned on each spindle at the same time, thus duplicating the work and increasing the output with each added spindle. All these devices make it possible to utilize comparatively untrained workers, as the operator simply loads and unloads the work from the machine. It must be remembered, however, that all these machines need supervision by skilled workers, both for setting them up for new work and for maintenance should any part of the mechanisms wear or get out of proper adjustment.

Builders of the well known Gray planer have made a startling innovation in planer design by interposing strips of plastic material between the planer table and its bed. This plastic makes the bearing surface between the two cast iron surfaces and takes all the load. This was adopted only after long and painstaking tests which indicated a better wearing condition and is believed to add to the accuracy of the work over a long period.

Another new design for a planer table includes the use of an hydraulic "hold-down" by oil pressure on the upper side of the table or slide. By maintaining a constant pressure on top of the guide this makes possible the use of higher pressures in the lubricating system without the danger of lifting the table from its ways. This has in the past necessitated the use of lower lubricating pressure than might have been used otherwise. One designer suggests that it may be possible to so control the pressures that the hold-down and the lubrication pressures may balance and permit the table to float on an oil film. To secure this condition it would be necessary to vary the pressures with the load on the table. The same method of lubricating and holding the table could be applied to any form of reciprocating mechanism.

The Monarch Company adhere to their practice of flame hardening the ways of their lathe beds and finishing by grinding. This of course eliminates scraping, which is a much discussed point. The increasing use of marble and granite surface-plates indicates that they are satisfactory and gives added weight to the argument that scraping is not necessary with accurate machining. Many still "spot" bearing surfaces simulate scraping, to satisfy those who cling to the idea that it is necessary to a good bearing.

A small but useful device for removing or collecting particles of steel which may come from wear of parts is finding favor. It is simply a permanent magnet set into the drain plug of any gear case or transmission, and collects stray particles of any magnetic material that may be in to oil or elsewhere. These are removed whenever the plug is taken out for draining the gear case.

Details of machine construction, such as the clutches used in various mechanisms are receiving attention. A centrifugal mercury clutch retards the engagement long enough to permit the motor to reach full speed before any load is applied. This limits the torque so as to prevent overloading the motor and enables it to start the load easily.

Methods of balancing rapidly rotating bodies have also been improved. A rather simple method is now being used on rotating bodies in which the load may be unbalanced at the start. This automatically supplies the proper amount of counterweight opposite the heavy portions, and restores balance. This is being applied to a spin-drying washing machine and to other devices in shops where balance is even more important.

FRED H. COLVIN.

**MACY FOUNDATION.** Established in 1930 by the late Mrs. Kate Macy Ladd in honor of her father, Josiah Macy, Jr., the Foundation reported total expenditures for the year ending Dec. 31, 1945, at \$406,746; total grants paid \$226,000. Drafts are not permitted upon the endowment, which has a ledger value of \$6,541,175. Emphasis is placed on special problems in medicine which require for their solution studies and efforts in correlated fields as well, such as biology and the social sciences. President: Dr. Willard C. Rappleye. Medical Director and Executive Secretary: Dr. Frank Fremont-Smith. Headquarters: 565 Park Avenue, New York 21, N.Y.

**MADAGASCAR.** A large island, belonging to France, located off the southeastern coast of Africa. Including dependencies, it has an area of 241,094 square miles and a population (1936) of 3,797,936, of which 25,255 were French.

**Population.** A number of different peoples or tribes comprise the native population of Madagascar. The most intelligent and numerous are the Hova, who speak a language that is related to dialects of Malaya and Oceania, and which serves more or less as a *lingua franca* for much of the island. In addition to the various native peoples, there are communities of Indians, Chinese, and Arabs, many of whom are engaged in the retail trade.

Madagascar has for several decades been the object of intense Christian missionary activity, particularly by Protestants. There are now nearly 2,000 Catholic and about 3,500 Protestant churches, in addition to 75 mosques. Most of the Hova and the other tribes in the central districts have embraced Christianity, while the outlying tribes are still largely pagan. Education among the

natives is also much further advanced than almost anywhere else in Africa. In 1939 there were 1,011 government schools with 128,947 pupils, and 706 private schools with 94,232 pupils. There are also higher institutions for advanced training in medicine, administration, agriculture, and the like.

**Government.** The colony now comprises not only Madagascar but the formerly separate colonies of Diego-Suarez, the island of Nossi-Bé, the island of Ste. Marie, and the Comoro Islands. The latter are strategically located in the Mozambique Channel about halfway between Madagascar and the African mainland. The Governor-General is assisted by a Consultative Council of Administration and until recently by an Economic and Financial Delegation comprising a French section and a native section. Both the French and native sections consisted almost entirely of elected delegates, who ordinarily met once a year to discuss the budget and other economic and financial questions. In 1945 a decree was signed creating a Representative Council to consist of sixty members: twenty elected by the French citizens in Madagascar, twenty natives elected by local bodies, and twenty appointed by the Governor-General (eight French and eight natives chosen to represent different economic interests, plus two French and two natives to represent labor unions). The members of the Council were to serve four-year terms upon election by a restricted franchise. They were to constitute a deliberative body whose decisions were binding. The Council thus had more power than the Economic and Financial Delegation had enjoyed. A large part of the lower civil and military offices are filled by natives.

**Events.** The nationalist agitation that was such a marked phenomenon in certain other parts of the French empire—notably North Africa and Indochina—made itself felt in Madagascar. Paris reported that the widespread independence movement on the island was responsible for riotous anti-French demonstrations during the spring, when Raoul de Coppet arrived to take over the office of governor-general.

On July 19 Léon Cayla, governor-general under the Vichy régime, was sentenced by the High Court of Justice to five years in prison, a 10,000 franc fine and "national unworthiness" for life because of the resistance which he had put up against British occupation of the island in 1942. Two days later it was announced that the British military mission in Madagascar had been withdrawn.

**Economy.** Madagascar is one of the largest and most valuable of the French colonial possessions. Soil and climatic conditions are favorable for the production of tropical and subtropical crops over wide areas. The principal crops, together with the area under cultivation in 1938, were: rice, 1,319,250 acres; manioc, 558,100 acres; maize, 216,162 acres; sweet potatoes, 296,400 acres; coffee, 230,080 acres; vanilla, 55,340 acres; and sugar cane, 43,401 acres. Forests are extensive and valuable. In 1936 there were 6,000,000 cattle in the colony. The beginnings of modern industry may be observed here and there. Graphite is the principal mineral product of the island, 14,400 tons being mined in 1938.

During the last prewar year (1938) Madagascar's imports were valued at 602,710,000 francs and her exports at 819,397,000 francs. France supplied three-fourths of the imports and took four-fifths of the exports. There is thus a considerable volume of shipping that calls at the island's ports, of which the most important is Tamatave. The total railway mileage exceeds 500 miles. Before the war

Madagascar was connected with France by a weekly air service.

ROBERT GALE WOOLBERT.

**MAGAZINES.** The first full peacetime year of 1946 found magazine publishers enjoying ration-free use of paper, though the demand far exceeded the supply. The industry was generally flourishing, but here and there appeared evidence that the war-stimulated boom in reading was nearing its peak, or in some cases was almost past. The public demonstrated that it could get its fill of some magazines, and unsold copies were dumped back to the publishers from the newsstands. A few oldsters seemed shaky, and more than one new venture had suspended by year's end. Production problems, too, seemed no nearer solution. Paper was still scarce; manufacturing delays were frequent (no less than two large new magazine suspensions were blamed on inability of printers to turn out magazines on schedule); and in general the industry worked harder than ever to maintain the gains it had made and was continuing to make.

One of the most serious problems which the industry as a whole had to face was that of bounding production costs. With the large wage increases granted printers (wages in the printing industry averaged second highest among those in all the industries reported on by the National Industrial Conference Board in July), costs rose to a point where they could no longer be completely absorbed by the publishers and had to be passed on to readers as well as advertisers. This came in the form of higher subscription and single copy prices for such magazines as *Ladies' Home Journal* and *McCall's*, which increased their single copy prices from 15¢ to 25¢; *Time*, which jumped from 15¢ to 20¢ a copy; *Life*, from 10¢ to 15¢ a copy (with annual subscription rates raised from \$4.50 to \$5.50); *Mademoiselle* from 25¢ to 35¢; *Saturday Evening Post* subscription price from \$4.00 to \$5.00. Increases were also recorded for *The New Republic*, *Parents'*, *Country Gentleman*, *Newsweek*, *Yachting*, and *Woman's Home Companion*, with every indication that many other magazines would follow the trend.

In a further effort to meet advancing costs, a number of magazines increased their advertising rates—some along with proportionate circulation guarantees. Among these were *Newsweek*, *Everywoman's*, *Saturday Review of Literature*, *Today's Woman*, *The New Yorker*, *Seventeen*, *Scholastic*, *Harper's*, *True*, *Journal of the National Education Association*. Advertising in magazines continued at an all-time high, reaching the astounding total of \$375,000,000, compared with \$305,000,000 in 1945. In October the *Ladies' Home Journal* contained the largest amount of advertising ever published in a single issue of any magazine, a total of \$2,146,746.20, and their figures for November and December were only \$50,000 to \$100,000 short of this.

At the year's end circulation of some magazines was mounting, with *Seventeen's* guarantee up to 750,000 and the million mark in sight; *Country Gentleman* up to 2,220,000; *Ebony*, the Negro picture magazine which started in 1945 with 75,000, was up to 300,000; the June print order of the Macfadden women's group advanced 32 percent over June, 1945; and the *Ladies' Home Journal*, with a circulation of 4,110,000, reached the highest figure for any monthly magazine carrying advertising. *Life* led the weeklies with 5,200,000 net paid circulation. Most magazines removed their wartime subscription restrictions. The quality

group, too, shared the rise, with the *Atlantic Monthly* and the *Saturday Review of Literature* reaching the highest circulations in their histories. Many magazines were reported to be readying large-scale circulation campaigns in order to build up a backlog of subscriptions to offset a possible newsstand slump in 1947.

Despite the doubtful reception accorded some new magazines on the newsstands, as well as increased manufacturing costs and slow production, dozens of new magazines were launched during 1946. These were largely of three types—travel magazines, publications in special fields, and digest periodicals. Curtis Publishing Company's new travel magazine, *Holiday*, was the most ambitious of the new ventures. Preceded by one of the largest advertising campaigns in magazine history, *Holiday* made its debut in February. The first issue was sold out—a lavish, expensive magazine selling at 50¢ a single copy. The photography was unusually good, and the advertising and text so elaborately laid out that there was some difficulty in distinguishing between them. After the first flush there was a slump in sales, but beginning again with the third issue, sales rose to a point where the advertising rates have been advanced as of March, 1947, based upon a circulation guarantee of 400,000. Recently a change in staff and editor took place, and while the magazine is still profuse in its use of color, the format is less spectacular and the magazine is generally more satisfying and readable. The present editors plan to work each issue around a single locale or resort, lending unity to the editorial content.

During the past year a number of other travel magazines entered the field. *Travel and Camera*, a 50¢ publication replacing the old *U.S. Quarterly Camera*, came out in the spring as a direct competitor of *Holiday*. *Let's Go*, a quarterly containing articles and photographs, started in May. This new travel quarterly is sold only in bulk to travel agents who imprint it with their own names and give it free to clients and prospects. In April *Smart Traveler* entered the field, with photos and factual articles indicating the costs of various vacation activities. *Pacific Highways* launched a new travel magazine, *Pacific Pathways*. Other newcomers in the travel field were a quarterly, *Travel America Magazine Guide*, containing information on travel facilities; a general travel monthly, *Everywhere*; *Trek*, a "magazine designed for people who are going places"; and *Vermont Life*, a regional travel magazine sponsored by the Vermont State Development Commission.

Among the new digest magazines were the *McGraw-Hill Digest*, comprised of articles condensed from the other magazines issued by this publishing firm. It is printed in English for distribution overseas. Vying for the market of book condensation magazines, the *American Mercury* issued *Bestsellers*. *Omnibook* started another magazine of novel condensations, *Book-Reader*, which contains lighter material than *Omnibook* itself. Also new to the digest field in 1946 were the following: *Best Stories*, a fiction monthly containing new and reprint fiction and classic short stories to give the reader an opportunity to compare old and new writers; *Story Digest*, *A Story a Day*, a pocket-size monthly sold on the newsstands only, containing condensations of short fiction from leading magazines, as well as novels, literary quizzes, etc.; *Racing Digest*; *Voice, the Sounding Board of the Air*; and many others.

In addition to these two groups of new magazines, there were a number of publications aimed at special fields of interest. David Lawrence, pub-

lisher of *U.S. News*, launched a weekly newsmagazine, *World Report*, designed to be the international counterpart of *U.S. News*. In February a new fashion magazine, *Californian*, was brought out—a slick aimed to compete with *Vogue* and *Harper's Bazaar*. *Deb*, another magazine which angled for the teen-age market, started in April and was suspended by the end of the year. Still another magazine aiming for the teen-age market was begun by the Parents Institute, *Sweet Sixteen*, for "teen-agers who prefer comics interspersed with their more serious reading." This teen-age market is one of the most crowded of all, and these new magazines must compete with such phenomenal successes as *Seventeen* and *Miss America*, the second of which changed editors, format, and editorial content during the past year and hence was able to attract a healthy amount of new advertising. For stamp collectors, *Philately* began publication; and in the radio field *Sponsor*, designed for radio advertisers, came out; *Radio Best*, a large-scale radio fan magazine, was promised for January, 1947. *Kiplinger Magazine* was announced by the publishers of the famous *Kiplinger Washington News Letter*. *Magazine Intelligence*, a bi-weekly containing a 50- to 100-word abstract of each non-fiction item in 117 magazines in the U.S., Britain, and Canada, was started.

Douglas Lorton, successful publisher of *Your Life, Your Health*, etc., added another magazine to his group, *Success Today*. And for the clubwoman, a new magazine *Agenda* was announced for publication in April, 1947. This is to have a controlled circulation of 3,000, will be distributed free to program chairmen, and will contain program suggestions and discussions.

For the book trade, *U.S. Book News*, a publication for the Latin-American trade about the American book trade and American books, was started, and *Book Merchandising* was announced for February, 1947.

One of the most interesting developments in the new magazines in special fields is the launching of a number of new Negro publications. There have been a number of Negro magazines going for many years, including *Negro Traveler*, *Service*, *The Postal Alliance*, *The Circuit Magazine*, *Manuscript*, *The Aframerican Woman's Journal*, *Color*, *Negro Business*, *New Vistas*, *Sepia Hollywood*, *Bronze Confessions*, *Bronzeville Magazine*, *Memo*, *Pulse*, *Journal of Negro History*, *Negro Digest*, *Opportunity*, *Spotlighter*. But it was not until the publication in 1945 of *Ebony*, a Negro picture magazine resembling *Life*, that the potentialities of the Negro market were realized, and in 1946 several new competitors entered the field. Among these were *Our World*, which resembles *Look* in its editorial approach and contains features on Negroes, the theater, beauty, cooking; *Bronze Housekeeper*, a small magazine distributed to colored housewives mainly in the Philadelphia area, *Sight*, a picture magazine dealing with Negroes in the entertainment world; *The Easterner*, containing short features, articles, and fiction about Negroes; *Eyes*, "the Negroes' Own Picture Magazine," to "show through stories the advancement of the Negro race"; and *Journal of Negro Business*, designed to serve the Negro businessman.

A new Marxist literary quarterly, *Mainstream*, is due in January of 1947. *Baby Post*, a new publication for expectant and new mothers, distributed free to customers of the Associated Merchants Corporation, is out to compete with *Baby Talk* and similar magazines. The Automobile Digest Publishing Company began an illustrated slick quarterly

for the Midwestern gentleman farmer, *Farm Quarterly*. This is distributed within a 750-mile radius of Cincinnati and started off with a 100,000 circulation guarantee.

Another unusual development in new magazines is the enterprise set up by Jerome Ellison, formerly of *Liberty*, *Reader's Digest* and *Collier's*, to publish a magazine owned, operated and produced cooperatively by leading American artistic and literary talent. Voting stock is held by active writers and artists, and the group, known as Associated Magazine Contributors, has some 300 investor-contributors. The first issue is due in February, 1947. The magazine will contain fiction, non-fiction and picture articles, with about 60 percent text and 40 percent pictures. It will be known as '47, *The Magazine of the Year*. (Each year the date figure in the title will be changed.)

Following the end of the war, a number of new magazines of interest to veterans were announced for publication, and several actually got under way, though many to date either have not appeared or have folded. One of those which did appear, however, was *Salute*, the staff of which was originally made up of former staff members of *Yank* and *Stars and Stripes*. In spite of adverse publicity centered around the original publisher, Leverett Gleason, the magazine came out in April, 1946. It had a strong G.I. flavor, carried photos, cartoons, fiction, articles on world affairs. In the latter part of 1946 the magazine was sold and the editors resigned, and there are indications that the magazine in new hands will appeal to the mass male market served by *Esquire* and *Pic*.

A new Macfadden publication, the first in eleven years, appeared in the fall of 1946—*Sport*, a general sports magazine aimed at spectators of all major sports and most minor ones, designed to reach the mass men's market.

*Science Illustrated*, the old magazine taken over, promoted, and reworked by McGraw-Hill, came out in April, 1946.

Among the smaller new magazines we have: *Sports Management*; *Frequency Modulation*; *Fashion Trades*; *Newsdealer*; *Occupational Medicine*; *Vend*, for the automatic merchandising industry; *Mammoth Adventure*; *True Police Cases*; *Buy Right*; *Fortnight: The Magazine of California*; *Texas Week*; *Oil Forum*; *Drink, the Magazine of the Liquor Consumer*; *Disc*, a magazine concerned with recordings of popular music for younger readers; the *Kirkeby Hotels Magazine*, published by the publishers of *Promenade*; *Your Own Home*; *The World in Books*; *Mr. and Mrs.*, a monthly modeled after *The New Yorker*, *Esquire*, *Vogue*, etc., dealing with men's and women's fashions, entertainment and literature; *Freedom and Union*, brought out by Clarence K. Streit's Federal Union, Inc.; four new magazines published by Parents' Institute's junior magazines—*Polly Pigtales*, *Calling All Boys*, *Calling All Kids*, *Sport Stars* (and in April they will bring out a new magazine for boys, *Varisty*); *American Inspiration*; *Geriatrics*; *Dixie Digest*; *Baker St. Journal*; and many others.

Coming in January are a new review of Southern affairs, *Pace*, and a regional magazine of the Southwest called *Scene*.

In addition to the many new magazines started during 1946 and those already definitely announced for 1947, there are still a few on which considerable spade work is being done. Among these is the new magazine project of Marshall Field, which will be called *U.S.A.*, on which Norman Cousins and J. R. Cominsky of the *Saturday Review of Literature* have been working for some

time. *Magazine X*, the new Curtis publication, is still in the experimental stage. This will resemble *Life* and is to appeal to the large mass circulation. *Collier's* and *Look* are also experimenting on new magazine projects, and it is reported that *Esquire*, Inc., is planning a new high-class quarterly, *Moment*, which will be published in Europe and printed in Swedish, French, German, and English.

In spite of the fact that the magazine business has been so prosperous, there is evidence that magazine publishers are still uncertain of the postwar market and the development of the industry. In order to determine this, they have conducted extensive surveys of readership and magazine audiences. One of the largest surveys was the "Continuing Study of Magazine Audiences," which issued three reports; the first on *Life*, *Collier's* and the *Saturday Evening Post*; the second on *Good Housekeeping*, *McCall's*, *Ladies' Home Journal* and *Woman's Home Companion*; and the third on *Look*, *American* and *Cosmopolitan*. Another survey was taken among advertising men and advertisers to determine whether general magazines should let circulation go up when paper is more plentiful, with corresponding advances in advertising rates. Seventy-eight percent answered yes. *Family Circle*, *Liberty*, *Glamour*, *McCall's* (on how many women read what magazines), The Thrilling Group (on who reads the pulps), and *The Atlantic Monthly* were among the others who conducted readership surveys.

There was evidence during the year that several of the larger magazines as well as some new publishers were viewing the foreign and overseas market with more than casual interest. The *Reader's Digest* brought out new foreign editions in Denmark, Japan, and Australia. Scheduled for March, 1947, are French and Norwegian editions of the *Digest*, and later a French-Canadian edition, which will bring the total of the *Reader's Digest* foreign editions to twelve. *Life*, *International* was set up to handle the foreign market for *Life*, and is revamping for permanent postwar operation. *Popular Science* broadened its foreign field with a Swedish edition called *Popular Teknik*, made up partly from *Popular Science* and partly from new material gathered abroad. The circulation of the Russian language picture magazine, *Amerika*, which was started by the Office of War Information and is now under the State Department's Office of International and Cultural Affairs, was raised to 50,000 copies, but with the budget slash by the House of Representatives, it was doubtful how long the magazine could be continued. After a conference in which the extreme importance of *Amerika* to the Russian people was stressed (it is said that there are thirty readers to a copy and that the magazine sells at high prices in the Russian black market), W. Averell Harriman, former U.S. Ambassador to Moscow, set up a foundation to insure the continuance of its publication. This is reported to be approximately \$250,000. *Omnibook* brought out a Latin-American edition and a continental European edition, and *Popular Mechanics* issued a French edition.

During the war years Crowell-Collier were the nominal publishers of *Victory*, a lavish, multi-lingual magazine of propaganda produced by the Office of War Information. As an outgrowth of this, they are planning an international peacetime picture magazine with United States subject matter. Writing and translations will be done here, and printing and sales in major countries of Europe and South America, which did not get *Victory*.

One of the most important as well as controver-

sial issues in the literary world was advanced by James M. Cain, of the Screen Writers' Guild in the June, 1946, issue of *The Screen Writer*. This proposal, known as the American Authors' Authority, outlined a new association of authors for all media—movies, books, magazines, etc. Under the terms of this association, authors would turn over the copyrights of all their material to the Authority, which in turn would (1) keep an accurate record of copyright and all transactions arising under it; (2) take over all court actions (as legal owner of the copyright); (3) enforce rights of copyright, especially in tax legislation, through maintenance of lobbies. The Authority would not act as authors' agents nor have anything to say about wages, prices, rates. No copyright would be sold outright, either in full or in part, but the Authority would lease it for a specified period of time. According to Mr. Cain, the basic premise of the Authority is to build a conception of an author as a creator of property. While membership in the Authority is not mandatory, and the Authority would accept the property of any author, a writer must join in order to have a voice in the management of the Authority.

While the Cain plan was accepted by the Screen Writers' Guild, tremendous opposition was shown by many authors and publishers and also within the ranks of the Authors' League itself. By the end of 1946 several full-scale debates and discussions had taken place regarding the proposal, and some modifications had already been proposed by Mr. Cain. The entire issue seemed certain to produce far-reaching and extensive changes in the editorial relationship between author and publisher.

Another newsworthy event of the magazine year was the publication in *The New Yorker* of the report on Hiroshima by John Hersey. This occupied the entire editorial space of the August 31st issue of the magazine, and was a sell-out almost as soon as it hit the newsstands. Magazine and picture rights were sold and the report reprinted in a number of newspapers. It has since been issued in book form by Knopf.

An event which created a stir in the magazine world was the appointment of Henry A. Wallace, former Secretary of Commerce and Vice-President, as editor of *The New Republic*. This is another of the many steps taken by *The New Republic* toward becoming a general opinion magazine. It has also changed its format, sponsored a national radio program and hired Edward Bernays as public relations counsel.

In November *Liberty* announced that starting with its February 1, 1947, issue, it would become a bi-weekly. Various changes in its editorial content were promised, including a large picture section. Interesting in connection with *Liberty* is the 16-page four-color ad of the Lionel Train Corporation in the issue of November 23rd. Unable to find a printer for their catalog, the Lionel Corporation asked *Liberty* to run the ad and to furnish them with sufficient "reprints" for distribution. Lionel got their catalogues, saved money, and *Liberty* carried what is reputed to be the largest single ad ever to appear in a national weekly.

Along with the many new magazines and other evidences of expansion on the magazine scene, there are the negative aspects of the business—most clearly shown in the large number of magazines suspended during the last year. These include *Deb*, *She*, *Fascination*, *Predictions by Experts*, *In Short*, *New Books Digest*, *Read, Fact*, *How To Reduce Stories*, *Aero Review*, *New York Radio*, *U.S. Home*, *American Family*, *Fighting*

*Aces*, *Industrial Aviation*, *New Europe*, *Strange Detective Cases*, and many of the veterans' magazines like *Veterans Outlook*.

Many of the magazines which were started during or immediately after the war may not be able to survive continued rising costs, strikes, slowness of production, and paper shortages, which have been plaguing even the larger and older publications. It is possible that even more suspensions will come with the decrease in buying power and lessening of reader interest in general. This reduction of the total number of publications is expected to free newsstand space for the better-selling and longer-established magazines.

A. S. BURACK.

**MAGNESIUM.** Only one magnesium plant, of 9,000 short tons annual capacity, was operating at the end of 1946, compared to a peak wartime capacity, never fully utilized, of 293,000 short tons divided among 16 plants.

The only prewar metal producing plant, that of the Dow Chemical Co. at Midland, Michigan, was dismantled. This plant had used salt brine wells as its source of raw material. Dow, however, resumed operations, recovering the metal from sea water, in July, at its Freeport, Texas, plant, which became the only magnesium metal plant operating on a commercial scale. Preparations were being made by the Henry J. Kaiser interests to reopen the Permanente Metals plant near Los Altos, California. The Freeport plant was operating at maximum capacity at the end of the year.

Aside from the Dow operations, consumer demand was largely supplied from a large tonnage of ingots left in stockpile at the end of the war. The privately held stocks owned by Dow had largely been used when the Freeport plant was reopened.

Shipments of wrought magnesium products totaled 3,100 tons during the year as compared with 3,000 tons in 1945. Plates, sheet, and strip represented slightly more than half this tonnage, the balance being extrusions and forging stock. The rate of shipments increased rapidly during the year, and the tonnage of the closing months was nearly double that of the opening months.

Castings production which was almost wiped out at the end of the war was slowly built up to a monthly rate of 500 tons at the close of 1946. Of this tonnage 85 percent was sand castings, nine percent die castings and six percent permanent mold castings.

The rapid increases in wrought and cast magnesium production for peacetime applications reflect the aggressive development and promotion of the metal by the industry. New products to apply the light weight and easy fabrication of magnesium are constantly being sought after. Some important markets are in metal furniture and in toys. Although the largest market in aircraft castings and forgings ended with the war, significant tonnages are still used in commercial and military aircraft.

Ingot production plants which are to be held in a standby condition for defense requirements have a total ingot capacity of 88,000 tons. The Velasco, Texas electrolytic plant has a capacity of 36,000 tons; the Spokane, Washington, ferrosilicon plant, 24,000 tons; the Painesville, Ohio electrolytic plant, 18,000 tons; the Luckey, Ohio ferrosilicon plant, 5,000 tons; the Canaan, Connecticut, ferrosilicon plant, 5,000 tons.

CHARLES T. POST.

**MALTA.** A British colony in the Mediterranean, comprising the island of Malta (95 square miles),

Gozo (28 square miles) and Comino (1 square mile). Civil population (1944 estimate), 279,187. Capital, Valetta.

**Production and Trade.** Malta produces wheat, barley, fruits, cotton, and livestock, and maintains an important fishing industry. In the war years exports were only a fraction of imports.

**Government.** Malta is governed according to Letters Patent promulgated on February 26, 1939, which granted a constitution providing for a council of government of 20 members presided over by the Governor. In 1943 the British Government announced that after the war responsible government would be restored, and in 1945 the National Assembly decided in favor of a two-chamber house. On November 28, 1946, the newly-appointed Governor, F. G. R. Douglas (succeeding Sir Edmund Schreiber, retired because of illness), announced at a meeting of the Council of Government that it was the declared intention of the British Government that responsible government should be reestablished in the islands, but that until elections were possible the Council of Government should continue to act as then constituted.

**MANDATED TERRITORIES.** Following is a list of territories conquered from the German and Turkish empires during World War I and mandated by the League of Nations to various of the Allied Powers under the terms of the Treaty of Versailles.

<i>Mandated Territory</i>	<i>Mandatory Power</i>	<i>Former Owner</i>
Cameroons, British . . . .	Great Britain	Germany
Cameroon, French . . . .	France	Germany
Japanese Pacific Islands . .	Japan	Germany
Nauru . . . . .	British Empire	Germany
New Guinea, Territory of .	Australia	Germany
Palestine . . . . .	Great Britain	Turkey
Ruanda-Urundi . . . . .	Belgium	Germany
Samoa, Western . . . . .	New Zealand	Germany
South-West Africa . . . .	Union of South Africa	Germany
Tanganyika Territory . . .	Great Britain	Germany
Togo, French . . . . .	France	Germany
Togoland . . . . .	Great Britain	Germany

Iraq, a territory mandated to Great Britain, became an independent state by treaty with the mandatory power on June 30, 1930. Iraq was admitted to membership in the League of Nations and the mandate terminated on Oct. 4, 1932. Syria and Lebanon were proclaimed independent republics on Sept. 16 and Nov. 26, 1941, respectively, by Gen. Georges Catroux, the Free French High Commissioner. On Dec. 27, 1943, an agreement was signed between representatives of the French National Committee of Liberation and of Syria and Lebanon, by which all powers and capacities exercised hitherto by France under mandate were transformed as from Jan. 1, 1944, to the Syrian and Lebanese governments.

As a result of the defeat of Japan in World War II, the Japanese Pacific mandates of Marshall, Caroline, and Mariana Islands passed under the occupation of the United States. The former Italian colonies of Libya, Eritrea, and Italian Somaliland were occupied by Great Britain. Under the draft peace treaties concluded in Paris by the major Allied powers in the summer, 1946, decision on the disposal of the Italian Colonies may be deferred for a year.

In the provisions of the United Nations Charter, a Trusteeship Council was created to dispose of "trust territories"—those non-selfgoverning territories that may be placed under United Nations supervision. In the concept of the Trusteeship Council, subject territories fall into three categories: (1), former German colonies mandated to various powers after World War I; (2), Pacific

Islands mandated to Japan after World War I, now occupied by U.S. forces, (3), former Italian colonies in Africa.

At the closing sessions of the United Nations General Assembly in December, trusteeship for the following territories were approved: Great Britain for the British Cameroons, British Togoland, and Tanganyika; France for the French Cameroun and French Togoland; Belgium for Ruanda-Urundi; New Zealand for Western Samoa; Australia for New Guinea.

On November 6 the United States requested that former Japanese mandates, and eventually other Japanese islands, be placed under the UN as "strategic area" trusteeship. Further request was made that the designated areas be placed under the sole administration of the United States with the right to fortify the islands and close them to the outside world for "security reasons."

**MARCUS.** A small island in the Pacific (24° N. and 153° 30' E.), 1,185 miles southeast of Tokyo; occupied by the Japanese in 1899; under United States control following the surrender of Japan in 1945. On November 6, 1946, the United States requested that the island be placed under United Nations trusteeship with the United States as administering authority.

**MARITIME COMMISSION, U.S.** The U.S. Maritime Commission, established by the Merchant Marine Act of 1936, is charged with the creation, development, and maintenance of an American Merchant Marine, adequate to serve as an auxiliary to the armed services in times of emergency; to carry all the nation's domestic water-borne commerce, and a substantial portion of its foreign trade.

A long range program to construct ships for replacement of obsolescent and over-age vessels was initiated in 1937-38, envisioning the building of 500 ships within ten years. At the same time a comprehensive system of training seamen was established, and other measures taken to insure the regulation and satisfactory operation of the American Merchant Marine under guidance of the Act of 1936.

An upward revision of building schedules was made in 1939 when an increasing burden was thrown on the United States merchant fleet by the outbreak and spread of war in Europe. Extension of aid to the nations aligned against the Axis in 1940 and the greater commitments planned under lend-lease led to the planning of an emergency ship construction program, put into operation in the spring of 1941. The first Liberty ships—the emergency-built vessels that came from the yards in so prolific a number in 1942 and 1943—were delivered the same month that Pearl Harbor was attacked.

A directive to the Commission from the President early in 1942 set the amount of shipping to be built that year at eight million deadweight tons and double that amount in 1943. The enormous productivity of the shipyards in the emergency program raised the amount of tonnage constructed under Commission direction in 1942 to more than the goal that had been set. As the emergency program made further advances in 1943, the year's total reached more than 19 million tons. In the first two years of wartime ship construction in the United States there were built 2,642 vessels. Their aggregate carrying capacity of 27,328,358 deadweight tons replaced all the shipping losses suffered by the United Nations.

At the beginning of 1944 the Commission an-

nounced that the emergency program would be curtailed during the year and that construction of faster cargo vessels and of special types for use of the armed services would be given emphasis. Production in 1944 was 1,786 ships aggregating 16,299,985 deadweight tons. Though this was about one-sixth less than the record made in 1943, it includes a number of large vessels built for or converted to military use, showing comparatively little deadweight tonnage.

In May, 1946, the Maritime Commission drew up the pattern of the nation's peacetime ocean shipping by officially designating thirty-two foreign trade routes as essential for maintaining the minimum flow of United States overseas commerce. Following is the list of essential routes, subject to augmentation or alteration as future circumstances warrant:

- Trade Route No. 1*—U. S. Atlantic port (Maine-Key West inclusive)—East Coast South America (Brazil, Uruguay, Argentina).
- Trade Route No. 2*—U. S. Atlantic ports (Maine-Key West inclusive)—West Coast South America (Chile, Peru, Ecuador and the Pacific Coast of Colombia).
- Trade Route No. 3*—U. S. Atlantic ports (Maine-Key West inclusive)—East Coast of Mexico.
- Trade Route No. 4*—U. S. Atlantic ports (Maine-Key West inclusive)—Caribbean ports.
- Trade Route No. 5*—U. S. North Atlantic ports (Maine-Cape Hatteras inclusive)—United Kingdom and Eire.
- Trade Route No. 6*—U. S. North Atlantic ports (Maine-Cape Hatteras inclusive)—Scandinavian, Baltic ports.
- Trade Routes Nos. 7 & 8*—U. S. North Atlantic ports (Maine-Cape Hatteras inclusive)—Antwerp, Hamburg Range.
- Trade Route No. 9*—U. S. North Atlantic ports (Maine-Cape Hatteras inclusive)—Atlantic France and Northern Spain (French-Belgian Border south to Northern Border of Portugal).
- Trade Route No. 10*—U. S. North Atlantic ports (Maine-Cape Hatteras inclusive)—Mediterranean, Black Sea, Portugal, Spain (South of Portugal), Morocco (Casablanca to Tangiers).
- Trade Route No. 11*—U. S. South Atlantic ports (Cape Hatteras-Key West inclusive)—United Kingdom and Eire, Continental Europe (North of Spanish Border), Scandinavian and Baltic ports.
- Trade Route No. 12*—U. S. Atlantic ports (Maine-Key West inclusive)—Far East (Philippine Islands, China, Manchuria, Korea, Japan, U.S.S.R. in Asia, French Indochina, Formosa and Siam).
- Trade Route No. 13*—U. S. South Atlantic & Gulf ports (Cape Hatteras-Texas inclusive)—Mediterranean, Black Sea, Atlantic Spain, Portugal, Morocco (Casablanca to Tangiers inclusive).
- Trade Route No. 14*—U. S. Atlantic & Gulf ports (Maine-Texas inclusive)—West Coast of Africa from Southern Border of French Morocco to Cape Frio and Madeira, Canary, Cape Verde and other Islands adjacent to the West African Coast.
- Trade Route No. 15A*—U. S. Atlantic ports (Maine-Key West inclusive)—South and East Africa (Cape Frio-Cape Guardafui) and Madagascar.
- Trade Route No. 15B*—U. S. Gulf ports (Key West-Mexican Border)—South and East Africa (Cape Frio-Cape Guardafui) and Madagascar.
- Trade Route No. 16*—U. S. Atlantic & Gulf ports (Maine-Texas inclusive)—Australia, New Zealand, New Guinea and South Sea Islands.
- Trade Route No. 17*—U. S. Atlantic & Gulf ports (Maine-Texas inclusive)—Straits Settlements, Netherlands East Indies.
- Trade Route No. 18*—U. S. Atlantic & Gulf ports (Maine-Texas inclusive)—India, Burma, Persian Gulf and Red Sea.
- Trade Route No. 19*—U. S. Gulf ports (Key West-Mexican Border inclusive)—Caribbean ports.
- Trade Route No. 20*—U. S. Gulf ports (Key West-Mexican Border inclusive)—East Coast South America (Brazil, Uruguay and Argentina).
- Trade Route No. 21*—U. S. Gulf ports (Key West-Mexican Border inclusive)—United Kingdom and Eire, Continental Europe (North of Spanish Border), Scandinavian and Baltic ports.
- Trade Route No. 22*—U. S. Gulf ports (Key West-Mexican Border inclusive)—Far East (Philippine Islands, China, Manchuria, Korea, Japan, U.S.S.R. in Asia, French Indochina, Formosa and Siam).
- Trade Route No. 23*—U. S. Pacific ports—Caribbean ports.
- Trade Route No. 24*—U. S. Pacific ports—East Coast of South America (Brazil, Uruguay, Argentina).

*Trade Route No. 25*—U. S. Pacific ports—West Coast of Mexico, Central America and South America.

*Trade Route No. 26A*—U. S. Pacific ports—United Kingdom and Eire.

*Trade Route No. 26B*—U. S. Pacific ports—Havre, Hamburg Range.

*Trade Route No. 27*—U. S. Pacific ports—Australia, New Zealand, New Guinea and South Sea Islands.

*Trade Route No. 28*—U. S. Pacific ports—Straits Settlements, Netherlands East Indies, India, Burma, Persian Gulf and Red Sea.

*Trade Route No. 29*—California ports—Far East (Philippine Islands, China, Manchuria, Korea, Japan, U.S.S.R. in Asia, French Indochina, Formosa and Siam).

*Trade Route No. 30*—Washington and Oregon ports—Far East (Philippine Islands, China, Manchuria, Korea, Japan, U.S.S.R. in Asia, French Indochina, Formosa and Siam).

*Trade Route No. 31*—U. S. Gulf ports (Key West-Mexican Border inclusive)—West Coast South America (Chile, Peru, Ecuador and the Pacific Coast of Colombia).

The functions of the Maritime Commission included, between 1939 and October, 1946; the construction of 5,856 ships, aggregating 57,057,560 deadweight tons. During 1945, cargo shipped from the United States on all flag vessels totaled 83,469,000 long tons. The labor force of the Merchant Marine, including shore reserve numbered 197,000 men in September, 1946.

**War Shipping Administration.** The WSA was created by an Executive Order of the President in February, 1942. It was given strategic control, for duration of the war, over all ocean-going vessels belonging to the United States except those under jurisdiction of the armed services. The training functions of the Maritime Commission were transferred to WSA. The U.S. Maritime Service for the training of seamen and their upgrading, and the Merchant Marine Cadet Corps for the training of young men directly as ships' officers were expanded to proportions by which the demands for ships' personnel have continuously been met. The Recruitment and Manning Organization supplements the efforts of owners, operators, and maritime unions in manning ships by seeking out experienced seamen ashore and inducing them to return to sea, and by taking whatever measures are necessary to prevent sailing delays for lack of crews.

Ships under control of WSA moved three-quarters of the 62 million long tons of export cargo from the United States in 1943. This rate of movement was about 20 percent greater in 1944.

In the first six months of 1945, 48,225,000 long tons of cargo were exported on WSA controlled vessels. Of this, 11,850,000 tons were bulk liquid cargo, the rest military and dry cargo. On November 1, there were 4,442 merchant ships of 46,839,000 deadweight tons under WSA control. On September 1, 1946, the WSA was absorbed by the Maritime Commission. The termination of the WSA brought to a close the greatest emergency shipping operation in maritime history. During the war WSA-controlled ships moved 75 percent of the total 268,000,000 long tons of cargo shipped overseas. Enemy action and marine disaster, due largely to war conditions, caused the loss of 733 large vessels. At the height of the war the WSA had 243,000 ship officers and seamen on its rolls, of which 196,000 remained at the time of absorption of the WSA by the Maritime Commission. A peak total was reached in 142,200 men assigned to ships in 1945. The number of men killed or reported missing after enemy attacks reached 5,000.

**United Maritime Authority:** The United Maritime Authority was established in November, 1944, to coordinate efforts of the United Nations in meeting shipping problems from the time of the defeat of Germany until six months after the cessation of

hostilities with Japan. Participating members are the United States, United Kingdom, Netherlands, Norway and France. Associate members include Belgium, Canada, Greece, Poland, Australia, Brazil, Chile, Denmark, India, New Zealand, Sweden, and the Union of South Africa.

Meeting in October, 1945, the UMA decided to maintain control over commercial ship operation until six months after September 2, date set for suspension of hostilities. The final session of the UMA 1946 Conference was held during the fall at Amsterdam, the Netherlands, during which it was decided to close the Authority. Each representative agreed to inform his Government if necessary measures needed to facilitate the prompt and efficient transportation of relief and rehabilitation cargoes.

**MARKLE FOUNDATION, John and Mary R.** Established in 1927 by John Markle. Limits its major activities to grants to institutions in support of special projects in medical research. President, Thomas W. Lamont; Vice-President, George Whitney; Treasurer, Vernon Munroe; Secretary, Florence E. Quick; Assistant Treasurer and Assistant Secretary, Irene R. Power. Offices: 14 Wall Street, New York 5, N.Y.

**MARRIAGE STATISTICS.** In the first eleven months of 1946, the total number of marriage licenses issued in cities of 100,000 or more inhabitants, was 716,469 (National Office of Vital Statistics). It exceeded the comparable figure for 1945 by 39.9 percent and the 5-year (1941-1945) average for January-November by 41.4 percent. Compared with 1942, the previous peak year for marriages, it was 31.5 percent greater than the January-November total and 20.4 percent above the 12-month total for that year.

A decrease in the number of marriage licenses issued was reported for only 7 of the 91 individual areas for the first 11 months of 1946 compared with the same period in 1945. The changes ranged from an increase of 91.9 percent in Chattanooga, Tennessee, to a decrease of 42.5 percent in Jacksonville, Florida. Compared with the 5-year average (1941-1945) for January-November, the changes ranged from an increase of 146.2 percent in Kansas City, Kansas, to a decrease of 45.9 percent for Jacksonville, Florida.

Interpretation of the increases and decrease reported for the individual areas must take into account changes in armed force distribution in or near the city concerned. Changes in State marriage laws during or preceding the comparison period also may have a pronounced effect.

The 91 areas covered by this report comprise 34 cities with a 1940 population of 100,000 or more, and 57 counties containing the remaining 58 cities in that size group. The counties represent cases where data for the city alone are not available. The combined population for the areas in 1940 constituted about one-third of the total population of the United States.

During the 6-year period, 1939 to 1944, the number of marriage licenses issued by all cities of 100,000 inhabitants or more, combined, rose from 408,989 in 1939 to an all-time peak of 594,908 in 1942, and then fell steadily through 1943 and 1944, according to summary statistics compiled by Director J. C. Capt of the Bureau of the Census. However, the 1944 annual total of 513,147 was still 25.5 percent higher than that for 1939, the year in which the Nazis invaded Poland.

As compared with the marriage figures for the

Month	Number of Licenses Issued	
	1946	1945
Total, 12 months	769,223	569,289
January to November	716,469	511,984
January	62,458	42,084
February	59,673	35,636
March	51,144	41,256
April	63,643	39,817
May	73,959	45,005
June	86,448	55,326
July	59,211	49,348
August	74,640	50,108
September	64,113	45,689
October	61,070	52,026
November	60,110	55,691
December	52,754	57,305

Nation as a whole during the same period, the city totals exhibited a more rapid rise at the outset, reached a relatively higher peak above the 1939 level, and subsequently receded somewhat more slowly toward the total for that earlier year.

The regional differences which appear reflect principally differences in the degree and timing of the impact of the war on the economy of the several regions, and the influence of the geographic location of Army and Navy installations, particularly training centers.

In general, the peak came earlier in the Northeast and North Central cities, while the Southern and Western city groups showed the greatest comparative gains. By the end of 1944 the annual total of marriage licenses issued by the major cities in the Northeastern and North Central States had reverted to something like the 1939 level. In the South and the West, however, the number of marriage licenses issued was about 75 percent greater in 1944 than in 1939.

#### MARRIAGES IN CITIES OF 100,000 INHABITANTS OR MORE, COMBINED, AND IN THE UNITED STATES, AS A WHOLE, 1939 TO 1944

(A minus sign [-] denotes decrease)

Year	Total Marriages	Increase Over Preceding Year		Increase Over 1939	
		Number	Percent	Number	%
(In Cities of 100,000 Inhabitants or More*)					
1944	513,147	-48,815	-8.7	104,158	25.5
1943	561,962	-32,946	-5.5	152,973	37.4
1942	594,908	47,731	8.7	185,919	45.5
1941	547,177	70,273	14.7	138,188	33.8
1940	476,904	67,915	16.6	67,915	16.6
1939	408,989	.....	..	.....	...
(In the United States <sup>b</sup> )					
1944	1,441,000	-136,000	-8.6	66,000	4.8
1943	1,577,000	-181,000	-10.3	202,000	14.7
1942	1,758,000	79,000	4.7	383,000	27.9
1941	1,679,000	114,000	7.3	304,000	22.1
1940	1,565,000	190,000	13.8	190,000	13.8
1939	1,375,000	.....	..	.....	...

\* Statistics represent marriage licenses issued in 34 cities with a 1940 population of 100,000 or more, and 57 counties containing the remaining 58 cities in this size group. County data are used where data for city alone are not available. <sup>b</sup> Statistics represent marriages performed. Figures for 1941 to 1944 are estimates; figure for 1944 is preliminary.

The war produced a remarkable increase in the percentage of men and women who were married and the new matrimonial level was maintained in at least the first six months of the postwar period. The number of married couples increased by more than 3,720,000 from April, 1940, to February, 1946. About one-third of this increase may be attributed to the high wartime marriage rates and two-thirds to an increase in the number of persons of marriageable age.

**Marital Status by Sex and Age.** Since many men were still in the armed forces in February, 1946, the number of married women represents the best approximation to the number of married couples in the United States. At this time there were 33,-

810,000 married women (not including the relatively few in the armed forces or in institutions), representing 63.2 percent of the female civilian noninstitutional population 14 years old and over. A similar survey made in February, 1944, showed 32,850,000 women married, or 62.8 percent of the female civilian noninstitutional population 14 years old and over. In 1940 the decennial census showed that only 30,090,488, or 59.5 percent, of the total female population 14 years old and over were married. (If the 1940 figure were adjusted to exclude women in institutions, the percentage married would be increased to 59.8.)

years old and over also contributed to the rise in the overall proportion married.

The distribution of civilian men by marital status cannot be fairly compared with the distribution of civilian women, as the disparity created by inductions of men into the armed forces has not yet been eliminated by discharges. Between February, 1944, and February, 1946, the number of single men in the civilian noninstitutional population 14 years old and over increased by 34.3 percent, of married men by 8.0 percent, and of widowed and divorced men by 20.0 percent. In terms of absolute numbers there was a net increase of 2,380,000

MARRIAGE LAWS REQUIREMENTS\*

\* Time allowed between date of examination and issuance of license.

<sup>b</sup> In 1919 law adopted applying to male only, laboratory test authorized but not required.

<sup>c</sup> Syphilis.

<sup>d</sup> Common-law marriage age.

<sup>e</sup> Syphilis and other venereal diseases.

<sup>f</sup> Amended in 1939.

<sup>g</sup> Venereal diseases.

<sup>h</sup> Syphilis and gonorrhea.

<sup>i</sup> In 1924 law adopted applying to male only; laboratory test authorized but not required.

<sup>j</sup> In 1929 law adopted applying to male only; no provision as to laboratory test.

<sup>k</sup> "Yes" indicates that the state prohibits the marriage of those with a transmissible disease in an infectious stage.

\* Information furnished by the Women's Bureau, U.S. Department of Labor.

The increase between 1940 and 1946 in the percentage married among adult females was equal to the increase in the 50-year period from 1890 to 1940. The increase since 1940 is without doubt attributable mainly to the psychological effects of war conditions and to a new sense of economic security resulting from full employment and higher wages. These causes led to an increase in the proportion married for women of all age groups except young women 14 to 19 years old. The changing age composition of the female population 14

married men, 3,200,000 single men, and 450,000 widowed and divorced men. In 1946 there were 1,880,000 more married men in the civilian noninstitutional population than there were in the total population in 1940, but the number of single men was 5,070,000 less.

It is not possible to observe in the census data the full effect of the recent great increase in divorces or in the number of war widows, as many widowed and divorced women have remarried and are returned as "married." Since 1940 there has

been only a small increase in the proportion of females 14 years old and over who are widowed and divorced (and not remarried), from 12.9 percent in 1940 to 13.0 percent in 1944 and to 13.8 percent in 1946. At this last date there were only 150,000 more women reported as widowed or divorced than there would have been if the proportion of women in each age group who were widowed and divorced had not changed since 1940.

**MARTINIQUE.** Department of France in the West Indies, between the British islands of Dominica and St. Lucia. On March 14, 1946, the status of Martinique was changed from a colony to a department, effective January 1, 1947. Area, 385 square miles. Population (January 1, 1940), 260,000, mostly Negro and mulatto, with about 5,000 whites. Fort-de-France, the capital, had 52,051 inhabitants; Le Lamentin, 16,303. Sugar, cacao, bananas, pineapples, and rum are the main products. Trade (1938; in U.S. dollars): imports \$6,756,000; exports \$8,918,000. Budget (1937): 101,100,000 francs. The colony is administered by a Governor, aided by a privy council and a general council. All citizens without regard to color enjoy the same civil and political rights as Frenchmen in the mother country. The general council, which votes the budget, and the municipal councils are elected by universal suffrage. In addition, the colony was represented in the French Parliament by 1 senator and 2 deputies. Governor: Georges Parisot (appointed December 5, 1944).

**MAURITIUS.** A British island colony in the Indian Ocean, comprising the island of Mauritius, about 500 miles east of Madagascar, and a number of dependent islands. The area of Mauritius is 720 square miles with dependent islands totaling 87 square miles. Population of Mauritius (1944 census) is 419,185 with dependencies totaling 13,463. Capital: Port Louis. Authority is vested in a Governor, aided by an Executive Council and a Council of Government, partly elected. Sugar is the chief product and article of export, but copra, aloe fiber, tobacco and tea are also produced.

**MEDICINE AND SURGERY. Medical Officers Discharged.** Since V-E Day about thirty-two thousand medical officers have been released from military service. On May 1 the discharge requirements for the Medical Corp general-duty officers were reduced from 39 to 30 months of service; for certain specialist officers from 45 to 39 months. Officers returning from overseas will be discharged if their eligibility for discharge is due within six months. Army doctors overseas, regardless of military occupational specialty, will be separated or en route to the United States within 60 days of eligibility. These measures will result in a more rapid return to their respective communities.

In 1945 the number of physicians in the United States increased by 1,892. Reports from licensing and examining boards in the 48 states, the District of Columbia, territories, and possessions list 9,153 licenses, 5,707 of them of first instance. The latter figure may be compared to 3,815 physician deaths in 1945, indicating an increase of 1,892 to the net physician population.

**Non-Explosive Anaesthetic.** Xenon, a gas which forms  $\frac{1}{170}$  millionth of the atmosphere, which we breathe, offers possibilities as a new non-explosive anaesthetic. The anaesthetic quality of xenon was discovered during studies on high altitude sickness. Dr. John H. Lawrence, and associates of the University of California, Berkeley, Cal-

ifornia, produced temporary staggering stupor and paralysis in mice with a mixture of 70 percent xenon and 30 percent oxygen. Tracer experiment with radioactive xenon showed that the gas permeates the spinal cord and whole nervous system in a manner characteristic of anaesthetics. The gas has narcotic effects on human subjects, as well as on animals. Anaesthesia produced by xenon may be extended by mixing the inert gas with another substance.

**New Insecticide.** The Navy announces the development of a chemical compound, which both kills and repels insects. Produced by Lt. Comdr. Michel Pijoan and Lt. L. A. Jackowski at the Naval Medical Research Institute, Bethesda, Maryland, the compound is called NMRI 448 from the initials of the institution and the fact that it was the 448th compound developed there. The product is non-toxic, is soluble in water or perspiration.

**New Drug for Asthma.** Ethyl-nor-epinephrine is an efficient bronchodilator which does not increase heart rate or blood pressure. During 18 months of trial in the Allergy Clinic, University of Maryland, Baltimore, Maryland, Howard M. Bubert, M.D. and John P. Doenges, M.D. found E.N.E. less stimulating to the central nervous system than epinephrine or aminophylline. Because of low toxicity, it is a drug especially valuable to children. Status asthmaticus may be reduced when other measures fail. Status asthmaticus patients inject one to two cc. intramuscularly at intervals of 20 or 30 minutes until an attack subsides. In rare instances of nervous reaction the first dose should contain 0.1 or 0.2 cc. less. Intravenously 20 cc. may be injected at the rate of two to five cc. per minute. It is the hope that this new substance will stand up under trial as more drugs are needed in the care of this distressing disease.

**Propylthiouracil for Hyperthyroidism.** The treatment of thyrotoxicosis with Propylthiouracil is simple, permanently effective, and without toxic effect. After analysis of 100 cases, Edwin B. Astwood, M.D. and Willard B. Vanderlaan, M.D. of the Joseph H. Pratt Diagnostic Hospital, Boston, Massachusetts, affirm that drug fever and agranulocytosis, serious complications of thiouracil, are unknown with this newer remedy. Prior iodine in any form may greatly delay the therapeutic benefit. Symptoms may recede after adequate dosage in a few days, but some patients require several months for complete disappearance of the disease. Hospital care or operation is almost never needed. Most patients continue at work during therapy. For at least six months after health returns, a maintenance dose of 75 mgs. and later 50 mgs. is administered daily. Long continued medication is not harmful. Enlargement of the thyroid gland or symptoms of myxedema indicative of excessive amounts of the drug are quickly corrected by adjusting the dosage. Exophthalmus is most effectively reduced by complete control of thyrotoxicosis. It is hoped that complete substantiation of this enthusiastic report is forthcoming.

**Radio-Isotope Supply.** Less than a week after Congress passed the Atomic Control Bill the War Department announced that relatively large amounts of radioactive isotopes would be made available to accredited research groups or educational institutions. The isotopes will come from the uranium piles of the Manhattan District. In announcing that isotopes will be available to science, the Army's surgeon general, Norman T. Kirk, declared: "Medical science would like to know more about how calcium and phosphorus are used in building teeth and uniting fractures, how iodine is used by

the thyroid gland, exactly what happens when the glands of internal secretion start malfunctioning, how the process of wound healing is carried out." Dr. Kirk went on to say that such questions and hundreds of others may be clarified by radioactive isotopes.

The solution of the distribution problem is near with the formation of a committee of scientists, which includes Dr. Cornelius P. Rhoads of Memorial Hospital, New York City, and Dr. Cecil J. Watson of the University of Minnesota, Minneapolis.

The criterion for allocation is the maximum benefit to the national welfare in the following priority:

- (1) Publishable research in fundamental sciences, including human tracer applications requiring small samples,
- (2) Therapeutic, diagnostic, and tracer applications in human beings and publishable research in fundamental sciences requiring larger samples,
- (3) Training and education,
- (4) Publishable research in applied sciences.

**Examining Boards in the Medical Specialties.** An Examining and certifying board has been established in 15 specialties, and all these boards have been in operation since 1940. In 1934 the Council on Medical Education and Hospitals of the American Medical Association formulated minimum standards governing specialty boards. These 15 boards are fully approved. As the general public becomes more familiar with the full significance of certification by these boards, a dependable means of judging the proficiency of a physician will be available. The minimum qualifications being necessary for certification as a specialist include such requirements as graduation from an approved medical school, completion of an internship in a hospital approved by the Council, and a period of specialized training in a selected specialty. Each board publishes a booklet containing information regarding its organization, personnel, purposes, and requirements for certification. The Advisory Board for medical specialties was organized in 1933 and 1934 for coordinated graduate education, and certification of medical specialties in the United States and Canada.

An analysis of questionnaires returned by 21,029 medical officers pertaining to their future educational plans indicate that over 12,000 medical officers will seek specialty certification after the war. This gives some idea as to the emphasis that is being placed by physicians on the importance and significance of this newly instituted system. On March 1, 1946 there were 26,108 physicians certified by 15 boards in the specialties of Internal Medicine and Surgery; 3,906 and 2,620 respectively have received the certificate of these boards. The greatest number, however, in any one specialty certified was in Otolaryngology. In this specialty 38,086 have been certified by this board since it was organized in 1927. The oldest board in existence, Ophthalmology, organized in 1917 has to date 2,490 members.

**Tridione in Psycho-Motor Epilepsy.** Those suffering from epilepsy today may well be thankful for the efforts of a host of scientists during the past 50 years. We need only contrast the cruel superstitious attitude of the past with the present enlightened efforts to normalize life and relieve their symptoms. Neither drugs nor diagnostic instruments, however, have been able to overcome certain forms of epilepsy, namely, the petit mal group and the psychomotor attacks. In the last few months reports of a new drug, Tridione, seems to promise an effective

method for reducing the disabling effects of these last resistant symptoms. Lennox of Boston, a well known authority on this disease found this drug to be of exceptional merit in controlling the main varieties of petit mal. Lennox administered the drug from two to 15 months to 50 patients subject to frequent daily petit mal, myoclonic, or akinetic seizures, who had not benefited by previous medication. Of these patients 40 had few, if any, grand mal seizures, while in the remaining 10 grand mal attacks were frequent. In the group of 40 patients the Tridione treatment eliminated the petit mal seizures 28 percent during the period of study. In 52 percent the number of seizures was reduced to less than one-fourth, and in 20 percent the drug had little effect. Corroborative investigation is rapidly forthcoming. If the future of Tridione bears out the prophesy of its past, the drug will bring hope, comfort, and social stability to many thousands of children throughout the world.

**Folic Acid.** The more important components of the Vitamin B Complex that have been definitely established as essential to human nutrition are the following: Thiamin chloride, nicotinic acid, riboflavin. While it is recognized that pyridoxine and pantothenic acid are important members of the Vitamin B Complex, their value in human nutrition remains to be clarified. Lesser known factors are inositol, para-aminobenzoic acid, biotin, choline, and folic acid. Although the significance of these factors in human nutrition has not yet been fully determined, it is likely that they will be found to play an important role in human nutritive physiology.

Striking advances have been forthcoming in the past year in our knowledge and use of several of these lesser known factors. During the past year choline has been intimately connected with the therapy of cirrhosis of the liver. Much clinical and experimental evidence has been marshalled which strongly suggests that cirrhosis of the liver is a disease resulting primarily from numerous nutritional deficiencies. The determining factor in the animal diet appears to be casein which is important because of its content of methionine. This is a lipotropic agent with the ability to mobilize fat in the liver, and when given in adequate quantities capable of preventing experimental dietary hepatic injury. Its activity has been shown to be due to its choline content. Choline and cystine likewise appear to have lipotropic activity and have been used successfully in the treatment of cirrhosis. In the absence of these substances or if they are present in insufficient amounts, lipid or fat accumulates in the liver with a corresponding decrease in serum lipid. If, therefore, it is possible in early cases or even in moderately advanced cases to mobilize the fat already deposited in the liver and to prevent further deposition, the disease may be arrested, and liver function may even improve.

Folic acid is one of the latest factors of B Complex to be isolated. Its importance has recently received great emphasis in the demonstration by Spies and his associates of the Hillman Hospital in Birmingham, Alabama that it is a potent anti-anemic factor in certain types of macrocytic anemia in relapse. Spies states that he has no hesitancy in making the statement that folic acid, the synthetic Lacto Bacillus Casei factor, serves this function and performs a specific function in the maturation of the various cells of the bone marrow and has other obvious profound effects in our body. A further advance of great importance which assisted materially in the completion of this study was the development of a crystalline folic acid apparently

identical with this L. Casei factor by Angier and his associates of Lederle Laboratories. The exact minimum and optimal doses of folic acid have not been determined but studies at present indicate that there is some variation from patient to patient. The administration of as much as 400 mgs. daily has not caused any untoward symptoms. A daily dosage of from 5 to 10 mgs. parenterally or 10 mgs. by mouth will often produce a maximum hemopoietic response. The subjective and objective improvement that follows the administration of folic acid in persons with macrocytic anemia in relapse is similar to that which follows liver extract therapy. There is a tremendous upsurge of well being, increase in strength and vigor, a return of appetite, and the desire to walk about. There seems little basis for reasonable doubt now but that a valuable new anti-anemic substance is available.

**Rutin.** In 1936 Szent-Gyorgi and his associates prepared an extract of lemon peel which reduced capillary fragility and decreased capillary permeability. The active constituent was postulated to be a flavone derivative, but the exact nature of the active constituent was not determined. Chemical consideration suggested the hypothesis that rutin should possess the physiologic properties of the lemon peel extract, citrin, or crude hesperidin. Rutin occurs in many plants but is most successfully extracted from buckwheat leaves, and blossoms at a certain stage in the growth of the plant. It is isolated as a pure substance and has, at least, ten times the activity of crude hesperidin. It may favorably decrease capillary fragility as indicated by preliminary trial in a high percentage of cases when administered over a period of many weeks or months. This property has been reported particularly in hemorrhagic conditions associated with hypertension. It is not, however, a remedy for hypertension and has no possible effects on this disease except probably to fortify the capillaries to withstand the increased pressure of hypertension and thus to reduce the incidence of hemorrhage. Rutin has been found to be of negligible toxicity and devoid of cumulative action with no allergic activity. Premature and inaccurate publicity of the lay press has lead to the mistaken belief that rutin will reduce high blood pressure. No such results are actually possible.

**Streptomycin.** This year has seen the release of streptomycin for use in civilian practice of medicine by the Civilian Production Administration. This substance is an antibiotic of relatively slight toxicity produced by certain strains of streptomyces griseus when they are grown upon suitable media. The material is supplied in ampules containing 0.5 to 1 gm. each. There are two salts in common use, streptomycin hydrochloride and streptomycin sulfate. They are both readily soluble in small amounts of sterile pyrogen free water or normal salt solution. This material was discovered by Schatz, Bugie, and Waksman during the course of a systematic program devoted to the study of antibiotic material begun in 1939. It was the most promising of seven such substances. It is much more stable than penicillin in the presence of heat and intestinal contents. It is readily diffusible in the human body except in the cerebral spinal fluid and poorly absorbed from the intestinal tract. When injected parenterally it is rapidly excreted in the urine. It undergoes relatively little change in the body. Toxicity of streptomycin varies according to the method of manufacture. In general, more purified preparations are less toxic. Space does not permit the including here the indications for the use of streptomycin. A report prepared by

Dr. Chester S. Keefer, chairman of the committee on chemotherapeutics and other Agents of the National Research Council contains a complete summary of the knowledge to date concerning the use of this material. Particularly gratifying is the fact that this material seems to be effective in the treatment of tularemia, meningitis caused by Hemophilus Influenzae and in respiratory tract infection due to the Friedlander's bacillus. Studies on experimental tuberculosis in animals warrant investigation of streptomycin in tuberculosis in the human being. Clinical studies are in progress at this time. The evidence to date has not established the place of streptomycin in the treatment of this disease. That it represents an important weapon in the treatment of other hitherto resistant infections seems certain.

**Progress in Vitamin Diseases.** One significant development in the field of vitamins recently has been the appearance of a report by the Council on Foods and Nutrition of the American Medical Association of an outline of the changes in the body resulting from vitamin deficiencies and their effective treatment. The signs and symptoms given in the outline represent current authoritative opinion with regard to the stigma of vitamin lack. The table includes a statement of the stigmas and symptoms associated with deficiencies of Vitamin A, thiamin, riboflavin, niacin, ascorbic acid, Vitamin D, and Vitamin K, together with a statement concerning the treatment of each deficiency. Deficiencies of several vitamins, notably biotin, pyridoxine, pantothenic acid, and Vitamin E are not accompanied by stigmas which can be recognized at present. This report goes on to say that the subject is in the stage of fluidity and development which probably will necessitate early revision or amplification. Particularly is this true of the diagnosis and treatment of deficiency of folic acid. This vitamin has been prepared in isolated form so recently that its consideration here is omitted. Vitamin deficiencies commonly encountered in clinical practice are multiple. Scrutiny of the dietary history has indicated that several of the stigmas listed are present. In presenting the syllabus the Council directs that emphasis be placed on the view that vitamins must never be relied on as a substitute for the regular consumption of an adequate diet.

**Vitamin B Complex.** Intensive studies have established that Vitamin B represents the group of water soluble, but otherwise unrelated dietary factors closely associated in nature. For practical purposes this group has been termed, the Vitamin B Complex. At least, a dozen separate factors, nine of which are available in crystalline form, make up the Vitamin B Complex. It is likely that other factors are as yet to be discovered.

**Hyperthyroidism.** For many years investigators have been seeking a satisfactory method for the treatment of hyperthyroidism by non-surgical means. Prior to 1923 Means and Holmes showed that irradiation of the thyroid by means of x-ray would definitely cause a remission of the disease in some cases. In their study about a third of the patients were cured by external irradiation, another third improved, and the final third was not greatly affected. Because of the lack of satisfactory criteria by which one might select those patients in whom hyperthyroidism might be expected to respond to x-ray treatment, this form of therapy gradually lost popularity and now is only occasionally employed. A new method of irradiation of the thyroid gland was made possible by the production of radioactive isotopes of iodine, a substance which is normally

picked up from the circulating blood and stored in the thyroid gland.

Induced radioactivity was first discovered in 1934, and in that same year Fermi in Italy prepared radioactive isotopes of iodine. Because the thyroid absorbs iodine selectively, it seemed likely that beta rays from iodine rendered radioactive would have a greater radiation effect than that derived from roentgen rays delivered through the skin and overlying tissues.

Hertz, Roberts, and Evans, in 1938, first used radioactive iodine to study the physiological function of the thyroid gland. In 1942, Hertz and Roberts made a preliminary report on the treatment of a small group of patients with radioactive iodine followed by ordinary iodine for a period of several months. In 1946, Chapman and Evans reported upon the treatment of a series of 22 patients by means of radioactive iodine alone in considerably larger doses than those given originally by Hertz and Roberts. The study of Chapman and Evans represents a continuation of the work of Hertz and is so encouraging as to warrant rather full discussion.

Only patients with classical symptoms of hyperthyroidism were treated. All had a definite goiter. No supplementary form of treatment was used. The radioactive iodine was prepared in the Massachusetts Institute of Technology cyclotron, by the nuclear bombardment of metallic tellurium. It was administered by mouth—"simply a drink of what tastes like rather stale water." Since the use of low doses of radioactive iodine was thought to be responsible for the failure of treatment in some patients in Hertz's series, Chapman administered considerably larger doses, averaging between 40 and 50 millicuries per patient. The largest single dose given was 79 mc. or 0.8 mc. per estimated gram of thyroid tissue. Concerning the result of treatment in this group of 22 cases, treated over a three-year period, Chapman and Evans state that "there are good results, surprising effects, and some poor results and disappointments." In 21 of the 22 cases, the goiter disappeared. Of 12 patients treated before August 15, 1944, eleven are well and show no signs of toxic goiter, while the twelfth continues to be mildly thyrotoxic. Of the ten patients treated since that date all have made a good response to treatment, although in one patient the basal metabolic rate continues to be above normal. In the successfully treated patients there has been increased sense of well-being, a gain of weight, a decrease in the size of the goiter, persistent fall in the basal metabolic rate, and a diminution of the abnormal eye signs associated with hyperthyroidism. Mild toxic reactions to the large doses of radioactive iodine, resembling roentgen ray sickness, were observed in six patients. The average length of time for the complete response to the radioactive iodine treatment was about seven or eight weeks.

Chapman and Evans conclude: "In hyperthyroidism orally administered doses of radioactive iodine . . . are concentrated largely in the thyroid gland. The beta rays from the radioactive iodine deliver within the thyroid an internal radiation which is physically similar to roentgen radiation. . . . Patients who had not responded to other forms of treatment or have been sensitive to iodine or thiouracil have responded well to radioactive iodine. . . . Ordinary iodine is not necessary with radioactive iodine treatment. We believe that therapy with radioactive iodine can be added to the growing list of medical methods for the control of thyrotoxicosis." (*J. A. M. A.*, Vol. 131:86, 1946.)

It is obvious that the series of patients treated is too small and the duration of time since treatment too short to permit any final conclusion to be drawn. The possibility of recurrence of hyperthyroidism, of the development of malignant changes in the gland, and of the appearance of signs of damage to adjacent structures such as the parathyroid gland must be considered. It seems safe to state, however, that this method of treatment is a promising one and that further trials with it are certainly indicated.

**Thiobarbital in the Treatment of Hyperthyroidism.** Thiobarbital is reported to have antithyroid activity similar to that of thiouracil. In a 16-months' study of thiobarbital in the treatment of 30 cases of hyperthyroidism, Dr. E. B. Astwood in the *Journal of Clinical Endocrinology* reports drug's activity was estimated to be twice that of thiouracil in inhibiting the function of the thyroid gland, but the toxicity was greater when the minimum effective dose was exceeded. Total daily doses of from 0.1 gm. once or .05 gm. twice daily. When daily doses of 0.2 gm. were exceeded drowsiness occurred, suggesting a cumulative effect of the drug. Thiobarbital seemed to be eliminated more slowly than thiouracil, although the drug fever, which occurred in six patients, was apparently benign in effect, and the drug could be continued in those individuals. Agranulocytosis, hepatic disease, early myxedema were also complications. While the drug does seem to have some definite effect, its toxic reactions seem too great at present to warrant general use of this drug without exercising great care.

**Stricture of the Esophagus.** The problem of the treatment of extensive cicatricial obliteration of the esophagus following extensive chemical burns has long been a difficult one. Reliance has usually been placed upon repeated dilatation of the constricted area by bouginage or if this effort proves to be unsuccessful, upon gastrostomy. Unfortunately, dilatation frequently has to be carried out repeatedly and the procedure entails the risk of producing a perforation of the esophagus. By making an artificial opening into the stomach through the abdominal wall (gastrostomy) it is possible to maintain the nutrition, of these unfortunate individuals, but since they are usually unable to swallow saliva, their lot is often a miserable one.

It has previously been reported in this review that the Russian surgeon, Yudin, has had a certain measure of success by substituting a segment of small intestine for the scarred area of the esophagus. (See 1944 *YEAR BOOK*, p. 377.) Recently, Richard H. Sweet of Boston, has described the successful employment in three cases of a new surgical procedure which seems both safer and more physiological than the operation of Yudin.

What Sweet has done, essentially, is to apply the technic which he developed for the treatment of carcinomas of the mid-thoracic esophagus to the treatment of extensive cicatricial obliteration of the esophagus. In this procedure, the thorax is widely opened, the diseased area of the esophagus excised, the stomach mobilized by dividing all of the arteries which supply it with blood except those at its distal end, and then the mobilized esophagus is brought high into the chest. The divided proximal end of the esophagus is implanted into the anterior wall of the stomach which is then fixed to the chest wall. In this fashion, the stomach is made to become a thoracic organ instead of an abdominal one. Interestingly enough, none of Sweet's patients in whom a procedure of this type has been carried out has had any serious deleterious effect upon the

functioning of the heart or the lungs produced by the transplanted stomach. All three operated on for stricture had relatively uneventful convalescences and all were able to swallow normally. In the third patient, a woman of 27, whose esophageal stricture had followed the ingestion of lye, the scarring and contracture of the esophagus was so extensive that almost all of the esophagus had to be removed, and the ultimate esophagogastric anastomosis done some distance above the thoracic aorta lay in the very apex of the chest.

Sweet's operation, in contrast to previous methods, can usually be carried out in one stage. Furthermore, it more nearly restores the normal continuity of the alimentary tract than have previous procedures, and it seems to represent a definite advance in the treatment of this difficult surgical problem. (*Surgery, Gynecology, and Obstetrics*, Vol. 82: 417, 1946.)

**Deep Burns.** Connor and Harvey of the Yale School of Medicine, described before the annual meeting of the American Surgical Association in April, 1946, a method of treating deep burns, the chief objective of which is to secure an early separation of the dead tissue in the wound from the living tissue. It has been recognized for some time that the crux of the problem in the treatment of the severely burned patient relates to the wound itself, that as long as the wound resulting from the burn remains open serious disturbances of the chemical state of the body and of the patient's general nutrition are apt to occur, and that with closure of the wound there is a marked improvement in the general condition of the patient. Prompt closure of the wound, then, becomes a prime objective in treatment. This is usually accomplished by the application of skin grafts to the wound, but in deep wounds, particularly in those which involve the entire thickness of the skin, delay in the application of grafts is usually necessitated by the slowness with which the dead tissue or slough separates from the underlying viable tissue. As long as this layer of dead tissue is present, skin grafting is impossible.

Connor and Harvey found that the separation of the slough could be greatly hastened if the acidity of the surface of the wound was increased. After studying a large series of organic and inorganic acids, they found that pyruvic acid exhibited outstanding advantages. In their method, the burned area is thickly covered with a homogeneous, relatively thick paste consisting of a mixture of diluted pyruvic acid and cornstarch. This is enclosed within a moisture-proof dressing to prevent drying of the mixture. Having noted that separation of the slough proceeded from the margins of the wound, they found it advisable in large wounds to incise the slough in order to create more margins. Dressings are performed at intervals of 2 to 3 days, if possible, and in third-degree burns not involving tendon or thick fascia, the wound is usually ready for grafting within a week or slightly longer. The pyruvic acid mixture in the concentration employed by Connor and Harvey has the great advantage of not injuring islands of viable tissue which may remain in the burned area. The method may be employed, therefore, not only for burns involving the entire thickness of the skin (third degree) but also for burns involving only a partial thickness of the skin (second degree) and for mixed second and third degree burns. Connor and Harvey state, "More than 30 cases have been treated in this manner, many of them with multiple wounds. The results have been similar to those previously described in the experiments in animals.

The layer of dead tissue separates rapidly, and living islands of skin survive in those areas in which the full thickness of the skin has not been destroyed in the burning. The deep wounds are then acceptable for immediate grafting, and in the more superficial wounds the islands of viable epidermis regenerate. All areas of the mixed clinical burn may thus be treated under the same dressing. The ultimate objective of treatment in deep burns, namely the early closure of the wound, can thus be easily achieved." (*Annals of Surgery*, Vol. 124: 799, 1946.)

**Renal Failure.** Since 1914 numerous studies have been carried out in an effort to perfect an artificial kidney which could remove from the blood the abnormal accumulation of metabolic products which follow injury to the kidney and result in anuria and uremia. The hope of the studies was that the normal excretory function of the kidney might be carried out in some other fashion, thus providing the time necessary for the repair of certain types of acute renal injury in which irreparable damage to the kidney has not occurred. Two common types of more or less self-limited acute renal injury are, (1) that which accompanies the administration of incompatible blood, and (2) that seen occasionally after the administration of sulfonamides.

In all the experimental studies an attempt was made to remove the abnormal metabolic product by dialysis. Numerous methods were employed, including the use of collodion and, later, of cellophane tubes immersed in a water bath into which the arterial blood of the animal was led and, after dialysis of its abnormal constituents through the permeable membrane, then returned into an appropriate vein. As early as 1923 it was found that the peritoneum lining the abdominal cavity of the living animal was an efficient dialyzing membrane and that if fluid was placed within the peritoneal cavity and then removed, significant amounts of nitrogenous waste might be removed. It was not until this year, however, that Fine, Frank, and Seligman of the Beth Israel Hospital in Boston developed a practical method for the irrigation of the peritoneal cavity in certain cases of acute renal failure and described its successful employment in man. (*Annals of Surgery*, Vol. 144:857, 1946).

In their method, a sterile irrigating fluid flows by gravity through an inlet tube of perforated stainless steel which previously has been inserted through one of the flanks into the peritoneal cavity under local anesthesia. In the opposite flank, the outlet tube consists of a stainless steel sump drain attached to a constant suction line. This irrigating fluid contained inorganic salts and dextrose in amounts approximately equal to those found in human plasma and, in addition, heparin to prevent the formation of fibrin clots and the formation of peritoneal adhesions and penicillin and sulfadiazine to minimize the possibility of the development of peritoneal infection.

In the first patient studied, a woman of 49 with ureteral obstruction due to an advanced carcinoma of the cervix and with clinical signs and symptoms of uremia, it was shown that continuous peritoneal irrigation could be carried without discomfort and without the production of peritonitis and that it could rapidly reduce the blood level of nitrogenous substance to normal, and simultaneously correct the uremic state. Because of the nature of the disease, however, uremia recurred when irrigation was discontinued and the patient died a month and a half later. Of the three subsequent cases, in two the anuria resulted from incompatible blood trans-

fusions and in the third from sulfadiazine therapy. In each instance, it was demonstrated that peritoneal irrigation could remove nitrogenous waste products from the blood rapidly enough to eliminate the uremic state. In the second patient, death occurred from multiple pulmonary emboli after a significant return of kidney function had appeared and after the patient seemed to be convalescing.

The third patient, a man of 51, with anuria of five-days' duration following sulfathiazole therapy, was entirely relieved of his uremic symptoms. On the fourteenth day urine output began again and increased steadily thereafter and the patient left the hospital in good condition seven days after the peritoneal irrigation had been discontinued. The fourth patient, whose renal damage came from incompatible blood, died on the seventh day of peritoneal irrigation, apparently as a result of incorrect management of water-balance problems; indeed it seems that regulation of the content of the irrigating fluid and of the fluid administered by vein is perhaps the chief problem which confronts anyone who would use this method of treatment.

The authors state, "The foregoing experiences show emphatically that this method is still in the experimental stage. What is so far established is (1) that a properly performed peritoneal irrigation can eliminate all clinical and chemical evidence of the uremic states; (2) that significant improvement can be achieved within 36 to 48 hours; (3) that the total time required will vary with the duration and severity of the uremia, degree of saturation of the tissues with retained products, degree of dehydration or edema, the nutritional state, food intake, the rate of protein catabolism, the presence of associated disease and the rate of efficiency or peritoneal irrigation; (4) that irrigation will not injure the peritoneal structures; and (5) that the efficiency of irrigation so far as blood urea clearance is concerned does not diminish with time and exceeds the minimal degree (10 percent to 15 percent) of renal excretory function necessary to avoid reaccumulation of nonprotein nitrogen or urea."

Peritoneal irrigation as described by Fine, Frank, and Seligman, while yet beset with many practical difficulties, certainly gives promise of being an important method of treatment in certain common types of acute reversible renal injuries. This reviewer is acquainted with its successful employment in an as yet unreported case in his own community and has no doubt that at the present time trial of this method is being carried out in numerous centers.

**Treatment of Peptic Ulcer.** In 1943 Lester R. Dragstedt of the University of Chicago made a preliminary report on the treatment of ulcer of the stomach and duodenum by section of the vagus nerves to the stomach. The aim of this procedure was to abolish the effect of nervous stimuli on gastric secretions and the results of the operation in the group initially treated were excellent. Experiences accumulated since 1943 by Dragstedt and by others, notably Moore of the Massachusetts General Hospital and Grimson of Duke University, have shown that this operation is of great value in the treatment of certain types of peptic ulcer and indeed that the entire surgical approach to the treatment of peptic ulcer may possibly have to be modified.

The rationale of the operation of vagus section may be briefly outlined. While the cause of peptic ulcer is not known, one of the chief abnormal responses in the ulcer patient seems to be an exces-

sive secretion of acid in the absence of the normal stimulus of food and it is felt that the hypersecretion and hyperacidity of the fasting stomach in ulcer patients is largely determined by nervous stimuli. It has been known since the classic experiments of Pavlov many years ago that division of the vagus nerve to the stomach abolishes this neurogenic phase of gastric secretion. The operation of vagotomy in man, then, is aimed especially at obtaining a lowering of the acidity of the stomach during most of the 24-hour period when food which would normally neutralize the acid is not in the stomach.

Sporadic efforts in the past to treat peptic ulcer in man by vagus resection were not very successful, probably because complete division of all the fibers was not obtained. That the vagus nerve might be divided without causing any marked disorder of gastric, pancreatic, or hepatic function or of the absorptive ability of the small bowel has been shown by the fact that patients have well tolerated removal of the lower portion of the esophagus for cancer, an operation in which the vagus nerves are of necessity completely divided.

Following vagotomy, certain definite changes occur. The most striking of these, from the clinical point of view, is the almost uniform and immediate relief of pain. The patient awakes from anesthesia and states that the ulcer pain is no longer present. That this relief is not a result of anesthesia from vagus section is shown by the fact that distention of the stomach with a balloon still produces a normal pain response. The actual mechanism of the relief of pain is not clear. In most cases, healing of the ulcer occurs in a week or ten days. When studied by x-ray the stomach, following vagotomy, is sluggish and empties very slowly. Fortunately, in the absence of real obstruction at the pylorus, this delay in emptying seems to cause little clinical difficulty. Studies of acidity following vagotomy show that during most of the day there is little or no free acid in the stomach. The secretion during the fasting stage is also greatly diminished.

The clinical results have been strikingly good. Dragstedt stated in January 1946, "Except for one woman with a duodenal ulcer in whom subsequent testing indicated that a complete vagotomy was not secured, the result has been immediate, complete and permanent symptomatic relief, gain in weight, and in most cases objective evidence of healing of the ulcers. There have been no recurrences to date, no hemorrhages and no perforations. Fifteen of the patients required gastro-enterostomy at the time of the vagus section or subsequently because of cicatricial pyloric stenosis." (*Minnesota Medicine*, Vol. 29:597, 1946).

Moore stated in February 1946, "Follow-up on all of these patients has been carefully carried out and most of the patients have been grateful for their treatment and have been cooperative in returning for studies. During these return visits, no recurrence has been observed, with one exception consisting of a tiny duodenal fleck seen approximately eight months after operation, which again disappeared and was not accompanied by any return of symptoms. Following operation, as a general rule, the patients were allowed to eat and drink anything they wished, including alcohol and coffee, since it was believed that the operation would not be put to an adequate test if a patient was carried along on conscientious medical therapy." (*New England Journal of Medicine*, Vol. 234:241, 1946).

Section of the vagus nerve is most easily accomplished by an approach through the chest

where it is usually a relatively easy matter to identify, isolate, and excise the nerves from the level of the root of the lung to the diaphragm. In fact Moore goes one step farther, opens the diaphragm and removes the lower end of the nerves to the point at which they enter the walls of the stomach. The nerves may also be divided by the abdominal route by mobilization of the lower end of the esophagus, and where a concomitant abdominal procedure is necessary, as for instance in cases with obstruction at the pylorus of the stomach where an operation for relief of obstruction is required, vagotomy is usually done through an abdominal incision. It is apparently a reasonably safe procedure. Dragstedt, in January 1946, reported one death in 54 cases.

The operation, of course, would be valueless in the acute complications of ulcer, such as perforation or massive hemorrhage. Probably it should be used with caution in cases of ulcer of the stomach, because of the clinical difficulty in differentiating between benign and malignant ulcer of the stomach. In the presence of marked pyloric obstruction, a supplementary gastro-enterostomy is usually required. It seems to be especially useful in the treatment of recurrent ulcerations following previous operations on the stomach, and it may find its greatest value in the treatment of the large group of young or middle-aged persons with a long history of peptic ulcer who do not respond satisfactorily enough to a medical regimen to lead a normal life. It should be pointed out that the operation has been employed extensively for only three years and that it is as yet too early to be wholly sure what of the end results. It must be said, however, that up until the present the results of vagotomy have been surprisingly good.

WILLIAM H. POTTS.

**MELLON INSTITUTE.** The aim of Mellon Institute is the creation of new knowledge by scientific investigation for the benefit of mankind, in accordance with the institution's definite fellowship system. According to this procedure the researches are restricted to major problems of the pure and applied sciences and particularly chemistry—problems that require protracted periods of time for solution by specialists. The Institute was founded by Andrew W. Mellon and Richard B. Mellon in 1913 and is located at 4400 Fifth Avenue, Pittsburgh 13, Pennsylvania. It is a non-profit institution.

The industrial research of the Institute is organized on a contract basis, the problem being set by a person, firm, or association interested in its solution, the scientific worker being found and engaged by the Institute, and an industrial fellowship being assigned for a period of at least a year. Each holder of an industrial fellowship is given broad facilities for accomplishing the research entrusted to him and all results belong exclusively to the donor of the fellowship. Only one investigation is conducted on a specific subject at any one time and hence there is no duplication of the research activities of the fellowships in operation. At present there are 82 of these industrial fellowships, which employ 500 scientists and engineers. The projects range from ferrous metallurgy and refractories to novel pharmaceuticals or medicinal agents, synthetic rubber, new plastics and textiles, and improvements in foods and other essential commodities. All the work during wartime related to urgent military problems. The Institute's department of research in pure chemistry is concentrating on the synthesis of new chemotherapeutic agents. There is also a strong department of research in chemical physics.

Industrial Hygiene Foundation has its headquarters in the Institute.

**MENNONITES.** A religious group founded in Switzerland in 1525 in protest against ecclesiastical rule and rigid liturgy. In the United States the Mennonites first settled at Germantown, Pennsylvania, in 1683, ultimately dividing into 17 bodies.

**MERCURY.** Mercury production in the United States in 1946 receded sharply from the wartime rate, but was more than fifty percent higher than the average of the period immediately preceding the outbreak of war in Europe. Sharply sensitive to price, mining activity was restricted to about fifteen principal mines compared to approximately fifty during peak wartime activity. Total mine production for the year was approximately 25,000 76-pound flasks (1945: revised: 30,763 flasks). The major proportion of the total output came from long-established mines in California, with the balance from Idaho, Nevada, Oregon, Arizona and Alaska.

Consumption totalled about 30,000 flasks, early estimates indicated, with pharmaceuticals, chemicals, electrical apparatus, batteries, paint, disinfectants, and fungicides among principal uses. In 1945, 63,900 flasks were used.

Imports, principally from Mexico and Spain, fluctuated sharply, with nearly 14,000 flasks arriving in the first nine months of the year. Italy was a source of imports for the first time since 1940.

Prices averaged about \$100.00 per flask, leveling off after declining from \$196 per flask in 1943.

CHARLES T. POST.

**METEOROLOGY. January-May.** During the first four months of 1946, the mean monthly temperatures averaged above normal over most of the United States. Only in New England and in portions of the southwestern and Pacific Coast states was the mercury's average position at or below normal. The west central and northern Rocky Mountain states were, on the average, 6°-8° Fahrenheit warmer than usual. In the matter of precipitation, the southern states, from Texas eastward to Georgia and Tennessee, experienced above-normal amounts, as did other scattered regions across the northern part of the country. Generally subnormal precipitation was received throughout the entire western half of the country; the Southwest was particularly dry.

In January, scattered floods of record-breaking proportions occurred in many of the East Gulf States as a result of the heavy rains that fell over the area from the 5th to the 10th of the month. The upper Mississippi and Missouri Basins and the Ohio Basin also experienced severe and damaging floods, in which ice action aggravated the overflow along many streams. During February, severe floods again visited Georgia, Alabama, and Mississippi, with several exceeding those that occurred in January. Moderate floods were experienced in Georgia, Florida, Minnesota, the Dakotas, and Michigan during March. The heavy snow cover left by the winter storms in the northern tier of states from Minnesota to Maine was melted and carried to sea with only minor floods resulting, due to the generally warm and dry conditions prevailing in the critical areas during March. There was no extensive flooding in April.

On January 4, a series of tornadoes took 33 lives and caused over \$2,500,000 property losses in Anderson, Angelina, Nacogdoches, Leon, and Hunt counties in northeastern Texas. It is estimated that 300 persons were injured and 1,100 homes and

other buildings destroyed or damaged as a result of these storms. Tornadoes on the evening of the 6th killed 12 persons and caused about \$250,000 damage in several areas in northwestern Mississippi. During February 5-7, a blizzard swept the Dakotas and Minnesota, disrupting all normal activities. In the eastern part of South Dakota, the wind blew as high as 50 m.p.h. and piled up snow drifts from 5 to over 7 feet high. Eastern North Dakota and the west-central and northwestern counties of Minnesota were covered with sleet, snow and glaze. Snow drifts as high as 18 feet were reported between Morris and Appleton, Minnesota, and in the vicinity of Fargo, North Dakota, the blizzard is reported to have been one of the most severe of record. Trains were delayed at Fargo for almost 3 days, roads were closed for periods up to a week in the stricken area, and in the Minneapolis-St. Paul district light glaze caused many accidents to pedestrians and motorists. \$1,000,000 was the property toll exacted by the tornado which struck Ardmore, Oklahoma, at 3 a.m. on February 13. Only one person was killed, but 15 suffered injuries and 200 were rendered homeless. At least minor damage was done to some 1,700 buildings in the city. On March 8, southern Wisconsin experienced heavy snow and high wind, causing a transportation tie-up which at Milwaukee was the worst of record. Heavy snow and high wind also struck at areas in New Mexico and Wyoming on March 14-15; on March 20-21, Wyoming again experienced heavy snow. Several hailstorms, severe thunderstorms, and two tornadoes were reported from widely scattered regions in the Midwest and Southeast during the latter half of the month. In all of these, loss of life totaled 10 and property damage about \$575,000. The twenty severe local storms reported for April caused no loss of life and approximately \$2,500,000 property damage. The most noteworthy was the thunderstorm which, moving southeastward from Tennessee on a path 20 miles wide and 150 miles long, buffeted Madison, Marshall, Etowah, and Calhoun Counties, Alabama, from 4.30 to 8 p.m. on the 7th. The value of property destroyed is estimated at \$2,000,000; much livestock was killed by hail.

**May-August.** With exceptions to be noted, the four spring and summer months (May-August) were characterized in general by above-normal mean temperatures over the western half of the country and sub-normal ones in the eastern. May was cool for all except the Atlantic and Gulf coasts and the region west of the Continental Divide; June saw the monthly means rise slightly above normal in all but the Northwest, Northeast, and Southern States; during July only the Southeast was sub-normal; August found the whole northern and northeastern sections of the country on an average 2° Fahrenheit cooler than usual.

The precipitation regime was far more irregular. Rainfall was generally light over the western half of the country during May and June: no measurable May precipitation was observed at several stations in southern Arizona. From the Mississippi Valley eastward, rainfall was generally greater than usual in both months. During May, severe floods occurred in north-central Pennsylvania and western New York, where all previous flood stages of record were surpassed on many of the headwater tributaries of the Susquehanna River. Persistent heavy showers from the 5th to the 22nd of the month were followed by a heavy downpour that began after noon of the 26th and continued for 30 hours or more, at times reaching cloudburst proportions. The resultant floods which occurred

during the last few days of May took several lives and caused property damage amounting to millions of dollars. Soil erosion was exceedingly heavy, and numerous slides and washouts took place in the flood area. In June, floods over relatively small areas as the result of intense local storms were reported in northern Wisconsin (\$3,000,000 damage), Iowa, and Wyoming (a severe flash flood). July-August precipitation was spotty. The Southwest received a welcome above-normal rainfall, breaking the drought condition which had previously gripped it. Most of the central third of the country was dry during July, but rainfall averaged above normal along the Atlantic and Pacific coasts, in the Gulf States, the Southwest, and Montana and the Dakotas. August was dry on the Pacific coast and across most of the northern half of the country. Precipitation in the rest of the country was roughly above-normal. Rain in about twice the usual amounts fell on the New England coast and in sections of Florida, Texas, Arizona, Colorado, Missouri, and Illinois. As in July, there was no general flooding; but during both months a number of local floods occurred throughout the country. Considerable damage was caused by such a flood in the vicinity of St. Louis, Missouri, about the middle of August.

Crop loss and property damage resulting from the over 100 severe local storms (including tornadoes) reported during May exceeded \$10,000,000. The death toll was 19. Noteworthy are:—the hailstorm of the afternoon of the 10th which caused \$1,000,000 crop loss in a fruit-growing area near Grand Junction, Colorado; the Florida wind and rain storm of the 20th and the San Antonio, Texas, wind storm of the 29th, which together caused \$2,250,000 damage; and the northeaster of May 27-28, which blockaded Boston harbor. The 120 storms reported for June caused 4 fatalities and over \$13,750,000 property damage. A heavy rainstorm on the 2nd in western and northern West Virginia was responsible for crop losses in excess of \$1,320,000. One of the severest thunderstorms ever encountered at Boston, Massachusetts, swept over the city and vicinity on the evening of the 8th, taking a toll of 3 lives and a property loss of \$250,000. For 20 minutes on the afternoon of the 11th, the worst thunderstorm of record at Auburn, New York, brought winds estimated at 75 m.p.h. and left behind \$1,000,000 worth of damages. Tornadoes twice struck Detroit, Michigan, once on the 17th and again on the 27th. In all, 44 persons were injured and at least \$1,250,000 property damage caused. In addition, a weak tropical disturbance moved inland on the Texas coast near Port Arthur on the 16th, but did no damage. Approximately 110 severe local storms were reported during July. Deaths numbered 10; damages amounted to over \$7,500,000. A \$2,000,000 electrical storm struck Langley, South Carolina, on the 7th. An intense hail and wind storm on the 16th in the vicinity of Frazer and Circle, Montana, wrecked a crop loss of \$1,400,000. On July 5-6 a tropical disturbance affected the area from Wilmington to Manteo, North Carolina, and produced the greatest 24-hour rainfall of record at the latter city, 7.84 inches. Gusts reached 50 m.p.h., but on the whole the disturbance was weak and caused only minor damage. When it moved out again over the Atlantic, however, its intensity seems to have increased, and on the 10th it was reported passing southeast of Newfoundland. Severe local storms reported for August numbered 60: they cost 13 lives and about \$3,800,000. On the evening of the 17th, tornadoes struck at two towns in Minnesota.

egated body composed equally of laymen and ministers. Since reunion, bishops are elected by the Jurisdictional conferences. Within the United States there are 560 districts, supervised by superintendents, 21,463 pastoral charges and 40,264 preaching places. Abroad, in 50 countries, the result of missionary work, there are 7,425 churches, listing 870,000 members.

Major emphasis during 1946 was evangelism. The results were appraised by Bishop Edwin Holt Hughes (retired) of Washington, D.C. as "the most significant evangelistic effort in the history of American Protestantism." Incomplete figures indicate that 423,926 have been received from preparatory membership and on confession of faith and 403,808 by transfer during 1946. After removals by death, transfer and withdrawal there was a net gain of 846,379, the 1946 membership standing at 8,430,146. The year also showed 728 new or abandoned churches founded or reorganized.

Church (Sunday) school enrolment and attendance, shrinking since 1923, experienced a turn during 1945-46 when, like evangelism, it was made one of five objectives of a general forward movement, the Crusade for Christ. Not only did the recession stop, but an advance of 8 percent was recorded as the result of special, organized effort. Enrolment in 1946 was 5,147,508.

Giving increased markedly; the total raised for all purposes during 1946 being in excess of \$150,000,000. Women, through their Societies of Christian Service, paid \$9,005,779 for local work and \$4,723,081 for their missionary and benevolent program. The Church itself gave \$10,362,982 to World Service and conference benevolences. These gifts, together with other benevolent offerings, totaled \$34,580,544. The Church continued to devote its communion offerings, together with other donations, to overseas relief.

A survey indicates that during the five postwar years Methodists will expend \$100,000,000 on new and improved church property. During 1946 \$25,016,417 was paid for building and improvement. Church and parsonage property was valued at \$842,393,302 against which there was indebtedness of \$18,209,805.

Representatives of annual conferences abroad, meeting in Central Conference sessions, recovered sufficiently from the war to have convened and exercised their power of home-rule in the election of bishops. The Philippine Islands Central Conference in March consecrated as bishop the Rev. Dr. Dionisio D. Alejandro. The Central Conference of Northern Europe, meeting in Gothenburg Sweden in April, elected the Rev. Dr. Theodor Arvidson. Germany Central Conference convened in November in Frankfurt-am-Main and chose Dr. J. W. Ernst Sommer, theological seminary president, as bishop.

Bishop Titus Lowe of Indianapolis, Indiana was elected president of the Council of Bishops in March. Deaths during the year include Bishop J. Lloyd Decell of Jackson, Mississippi, Bishop Lorenzo H. King of Atlanta, Georgia and retired Bishop John L. Nuelsen of Madison, New Jersey. In China on February 4 Bishop and Mrs. Schuyler Garth, on an official visitation of mission stations, were killed in a plane crash.

**MEXICAN CLAIMS COMMISSION, American.** A Commission established pursuant to the provisions of the Settlement of Mexican Claims Act of 1942. Under this Act the Commission adjudicates claims and makes awards to claimants entitled to participate in the distribution of a lump sum settlement

recently effected by the Department of State whereby the Republic of Mexico pays \$40,000,000 to the United States in settlement of claims. Participating claims have originated over a long period extending from 1868 to 1940 and include claims relating to the expropriation of lands and mines, confiscation or destruction of personal property, injuries to individuals, and miscellaneous cases of alleged denial of justice. Chairman: Edgar E. Witt.

**MEXICO.** A North American republic. Area: 758,258 square miles. Population: 21,153,321 (1943). Capital: Mexico, D.F.

Mexico consists largely of a plateau of 8,000 feet average elevation bordered on the east, west, and south by mountains. Coastal lowlands extend along the Gulf of Mexico and the Pacific Ocean, and Yucatán Peninsula in the southeast is a vast lowland plain. Throughout the plateau area of northwestern Mexico and most of Baja California the climate is dry, with temperatures ranging from cool-temperature to hot. The southern part of the plateau region has a temperate dry-winter climate, which merges into tropical in the southeast and Yucatán Peninsula.

**Population.** Over half of the total population of Mexico are mestizos; 29 percent are Indians, and 17 percent persons of European descent. Population density is highest in the central highlands, lowest in the north and southeast. The three largest cities are: Mexico, 1,448,422; Guadalajara, 228,049; and Monterrey, 180,942.

Spanish is the official language, but some minority groups speak their native tongue and various Indian languages are spoken in rural areas. Roman Catholicism is the predominant religion.

In 1946, official estimates indicated that 35 percent of the adult population of Mexico was literate. In 1941 there were 23,191 primary schools with a total enrollment of 2,037,870. Excluding students in normal schools, 64,758 students were registered in 388 intermediate schools. Mexico has 13 universities.

**Government.** Under the Constitution of 1917, Mexico is a federal union of 28 states, 3 territories, and the Federal District. The Congress is bicameral, with a Senate of 58 members and a Chamber of Deputies of 147. Regular sessions begin on Sept. 1 of each year. The President is elected for a 6-year term and may not be reelected. He is aided by a Cabinet of 11 ministers. General Manuel Avila Camacho was elected President on July 7, 1940, and inaugurated on December 1, 1940.

**Events.** Mexico's presidential election year opened on a note of violence in Leon, State of Guanajuato, where Federal troops and thousands of citizens clashed when Ignacio Quiroz, mayoralty candidate of the Government-supported P. R. M. (*Partido Revolucionario Mexicano*) party took office against the wishes of the citizens who voted overwhelmingly in favor of Carlos Obregon, independent candidate supported by the Sinarquist Union, a rightist movement.

The citizens of Leon, a stronghold of the Sinarquist Union, held an open-air mass meeting near the government Palace on New Year's Day after State Governor Ernesto Hidalgo installed Quiroz. The meeting was broken up by troops, but the next day saw a larger meeting accompanied by closed stores throughout Leon. Throughout the day, troops and civilians brushed as tension grew more electric and in the evening, troops fired on the demonstrators, killing about fifty and wounding about 300.

The affair aroused wide protests that prompted

quick repercussions. On January 4 Governor Hidalgo dismissed Quiroz and appointed a non-partisan municipal board. The responsible officers, Colonels Barron and Martinez were retired. The final act occurred on January 9 when President Manuel Avila Camacho requested Congress to remove Hidalgo from office.

The Mexican newspapers found tacit support in the dismissals to the charges of local election fraud. The *sinarquista* claimed martyrdom for the dead and Ezequiel Padilla, ex-Foreign Minister and rightist-supported candidate for president, made campaign speeches about the massacre victims who were "showing Mexicans the road of honor and duty."

The indignation at Leon was echoed in industrial Monterrey on January 11 where a crowd of 15,000 filed through the streets honoring the "martyred" of Leon and requesting President Camacho to remove Felix González Salinas, the local mayor, supported by the P. R. M. Charges were made that local authorities prevented the followers of opposition candidate Manuel Barragán, a local industrialist, from voting. The demonstration was peaceful; the incident ended with opposition charging fraud and government replying that the conduct of the election was constitutionally correct.

The apparent success of the literacy campaign launched in August, 1944, as a temporary measure, encouraged President Camacho to draft a permanent literacy bill in mid-January for presentation to Congress. The bill urged every literate Mexican to teach one or more illiterate compatriots. Reports accompanying the bill showed that 1,073,000 illiterates were enrolled in "literacy centers" and 278,000 had passed literacy examinations up to December 31, 1945.

By the end of January campaigns and political lines for the July 7 presidential election grew more clearly defined. Leading candidate was government-sponsored Miguel Alemán, forty-five year old ex-Minister of the Interior, who was nominated on January 19 by Vicente Lombardo Toledano, proletarian labor leader, at the convention of the P. R. M. which, at the time, changed its name to the Party of Revolutionary Institutions (P. R. I.).

Opposing him was Ezequiel Padilla, backed by the Mexican Democratic Party and Catholic rightists, and Gen. Jesus Augustin Castro, who accepted the nomination of the National Constitutionalist Party on January 27.

As a possible measure to offset the effects of the Leon affair, the P. R. I. announced on February 1 that it would cease deducting "campaign contributions" arbitrarily from the pay envelopes of government employees.

By May, candidate Alemán predicted a landslide victory for himself. From all indications his optimism was well founded. He was a nationalist and repeatedly declared that Mexico would not yield any control of management or exploitation of oil fields to foreign interests. If any nation needed oil, he said, Mexico would be glad to cooperate and accept foreign capital to increase its output of oil. In numerous campaign speeches he convinced the people of his liberal, not extremist, views. This brought the wealthier classes as well as the working people to his support, for it allayed fears of state nationalization. The church, a powerful factor in Mexican politics, refrained from any commitment, a condition interpreted as acceptance of Alemán. Furthermore, Alemán was backed by the P. R. I. which virtually included all voters, especially since its reorganization in December 1945 when it enlarged its scope to include many

syndicates that had adhered to the labor leadership of the C. T. M. (Mexican Confederation of Workers).

On domestic issues Alemán advocated wide industrialization and greater distribution of wealth; for as Mexico developed, her economy "should adjust itself to the norm of prosperity which will enable all classes to share in it." He preferred real estate and mineral wealth in the hands of nationals, and assured foreign capital of a legitimate profit. Speaking on foreign affairs, he favored cooperation with the United States and full participation in the United Nations.

Padilla, internationally respected as a diplomat, faced the problem of fighting Mexico's top political organization and vote-getting machine. He was further hindered by the label of being too pro-United States, a reputation gained by close association with the United States at the Chapultepec and San Francisco conferences. On May 31, Padilla said that the United States should withhold recognition of any Latin American government until convinced by observation that it represented the will of the people. However, the United States should not intervene in any election, he added. Padilla's statements were immediately used by the opposition which, in posters and newspaper advertisements, construed his remarks as a request for United States aid.

Elections for a new Congress, scheduled to convene on September 1, were held in conjunction with the presidential elections. The P. R. I., which held undisputed control of both the Senate and Chamber of Deputies, was also opposed by the Communists, Sinarquistas and Acción Nacional parties which ran no presidential candidates.

In the most peaceful election in Mexico's history more than 2,000,000 registered voters gave Alemán a 3-to-1 victory over Padilla. The new election law of December, 1945, aimed at promoting an honest election, and President Camacho's election eve radio plea for a peaceful election made for the unusual conduct of the election. All polling places were officiated by duly appointed guardians while Federal troops acted as a nation-wide police force.

Immediately after the initial election returns indicated a sweep for Miguel Alemán, defeated candidate Padilla and his Mexican Democratic Party claimed the election was a fraud. There were numerous charges that the ballot boxes were doctored. However, in contrast to the 1940 election which was accompanied by much rioting and shooting, the 1946 election was generally accepted as a good example for all future elections.

On August 3 Mario Lasso, former Consul General for Chicago, and Secretary General of the Mexico City Committee of Padilla's Party, was arrested on a charge of plotting to kill Alemán. From his cell Lasso purportedly sent a letter to Padilla explaining that he had been brutally mistreated and forced to sign a confession. Police officials denied the accusation but the affair, together with the cries of fraud, inspired protest meetings and stay-at-home strikes. The furor, however, soon evaporated as the political situation stabilized.

Mexican labor, a leading power behind Alemán's election, spoke out in the last days of August against the possibility that Alemán was surrounding himself with big business lobbyists who might veer him to the right. Fidel Velásquez, president of the Mexican Confederation of Labor (CTM), pointed out that it was necessary for labor to work closely with Alemán to prevent a reactionary cabinet and undue pressure from the moneyed classes.

During August Vicente Lombardo Toledano, president of the Confederation of Latin American Labor (CTAL), of which the CTM was affiliated, issued a call for strong labor unity against "imperialist attempts to dominate Mexico."

In his farewell address to the Mexican Congress on September 1, President Camacho reviewed his six-year term and asked that the principle of non-intervention, "which we consider basic in the inter-American system and fundamental in Mexican foreign policy be strengthened and regulated." Elaborating on the domestic conditions, he found the oil situation satisfactory with petroleum reserves estimated at 870,000,000 barrels. During his last year in office production of the wells increased from 38,000,000 barrels to 45,000,000, and the volume treated at refineries rose from 35,000,000 barrels to 42,000,000. Income from domestic sales totaled \$80,400,000 and foreign sales amounted to \$14,000,000.

Mexican agriculture was shown to be in an excellent position. In the field of land distribution the Administration gave more than 500,000 hectares to 15,400 farmers. The allotment of four to eight hectares per person which existed in 1942 was raised to from six to twelve on the day of the President's address. During 1945 agriculture contributed nearly \$69,500,000 to a favorable balance of trade. The President predicted continued exports of wheat.

The high production in the oil industry was achieved despite labor difficulties. On September 2 all seven of Mexico's refineries were closed, for the first time since the Government took over the oil industry, because the workers insisted that the eighth hour of work be considered overtime and paid as such. Federal troops were posted around the refineries, but no disorders occurred. The strike ended on September 4 with the workers winning their demand. Efraim Buenrostro resigned as director of Pemex, the Government's oil administration, on November 27 and refinery workers announced a one-day strike on the same day in protest against a delay in equalizing salaries.

In his formal inauguration as President of Mexico on December 1, Miguel Alemán voiced his faith in the unity of the Western Hemisphere and the Good Neighbor Policy. Devoting most of his address to domestic affairs, the President promised a \$300,000,000 irrigation program to reclaim 1,400,000 hectares (3,459,400 acres) of land, greater extension of credit to agriculture and industry and reforms in the fields of banking and income taxes. He also promised to seek an extension of women's suffrage to permit voting in municipal elections.

President Alemán appointed the following Cabinet:

Foreign Affairs—Jaime Torres Bodet.

Interior—Hector Pérez Martínez, who was Under Secretary in the outgoing Ministry of Primo Villa Michel.

Treasury—Ramón Beteta, who was Señor Alemán's closest adviser and campaign manager.

Education—Manuel Gual Vidal.

Agriculture—Nazario Ortiz Garza.

Public Health and Welfare—Dr. Rafael Pascasio Jambos.

National Defense—Gen. Gilberto R. Limón, who was Under Secretary to outgoing Gen. Francisco Urquiza.

Communications and Public Works—Augustín García López.

National Economy—Antonio Ruiz Galindo, who is one of the nation's most important industrialists.

Labor and Social Welfare—Andrés Serra Rojas.

Acting Secretary of the Navy—Rear Admiral Luis Schaufelberger de la Torre.

Attorney General—Francisco González de la Vega, who has headed the Federal Investigation Bureau.

Governor of the Federal District—Senator Fernando Casas Alemán, who was Under Secretary of the Interior under Señor Alemán and has remained a close adviser. Señor Casas Alemán is not related to the new President.

Chief of the Agrarian Department—Mario Souza.

District Attorney of the Federal District—Carlos Franco Sodi.

Secretary of Irrigation—Adolfo Orive de Alba. This is a new ministry, whose establishment indicates the emphasis President Alemán intends to place upon converting Mexico's arid acres into fertile lands. Señor Orive de Alba previously was Director of the Bureau of Irrigation.

Secretary of National Lands and Administrative Inspection—Alfonso Caso. This is also a new ministry.

Within a week of the inauguration the bulk of President Alemán's agricultural legislation was submitted to Congress. The two most important aspects of the legislation were a Constitutional amendment guaranteeing the property rights of owners of less than 500 acres and a proposal to establish a national colonization commission to effect a resettlement program. The Commission would administer a fund, select sites, evaluate prospects, determine the area of land allotted to each colonist and provide the basic mechanical implements.

The constant labor-management difficulties in the oil refineries was treated by President Alemán on December 21 with an order dismissing fifty leaders of the oil workers' union, who were named responsible for the illegal work stoppage. On the same day Antonio Bermúdez, director of Pemex, submitted demands to the Federal Arbitration Board for reorganization of Pemex-union relationship. The Pemex demands would scrap all existing contracts, establish new wage scales and permit Pemex to hire non-union workers.

Mexican labor was assured by Toledano on December 23 that President Alemán's dismissal of the fifty leaders of the oil workers' unions was not to be considered a Government precedent or an example for private industry. On the following day military escorts were removed from oil trucks as the oil workers decided not to institute a strike.

**Economic Development.** Mexico's cost of living which had followed a steadily rising spiral through the war years reflected itself in statistics released in January showing the volume of currency in circulation, including sight deposits. On December 22, 1945 currency circulation stood at 4,265,400,000 pesos as against 3,551,800,000 in December, 1944 with an average monthly increase of 69,500,000 pesos between the two dates. Between April, 1945 and April, 1946, the cost of living had risen 62.32 percent, making a total increase since January, 1943 of 362.46 percent. During the period between May, 1945 and March, 1946 the price of cooking oil rose 66 percent, beans 65 percent, tomatoes 66 percent, milk 32.6 percent, lard 38 percent, sugar 54 percent, coffee 41 percent, and beef 16 percent.

The rising cost of living was accelerated by a scarcity of basic commodities including wheat, beans and corn. In April Mexico's request for the sale of 500,000 tons of wheat from the United States was refused by both Henry A. Wallace and former President Herbert Hoover on the grounds of Europe's more critical need of United States wheat.

By the beginning of 1946 investments in Mexican industry, which employed more than 700,000 workers, amounted to about \$1,500,000,000, according to the official reports issued in February. The largest increase, compared with prewar years, was reported in the manufacturing industries, which absorbed more than 400,000 workers and \$515,000,000 in investments.

With procedures opened for the settlement of British and Dutch loans to the Mexican National Railways in March, Mexico entered the final phases

of liquidating external indebtedness. Among the obligations met by the Government were \$5,448,000 paid to American citizens for damages suffered in Mexico during the revolutionary period ending in 1920; \$16,000,000 of the \$40,000,000 debt to the United States for general and agrarian claims in accordance with the agreement of November 1941; \$19,000,000 of the \$29,000,000 debt to United States citizens and oil companies for oil properties appropriated in 1938, exclusive of the liquidation of other claims, which amounted to \$9,900,000; and \$776,400 paid to British subjects for damages in the Mexican Revolution. Beginning in 1948 Mexico will redeem bonds held abroad until final liquidation. On September 28 a fourth installment of \$4,085,325 was paid to the United States on the \$29,000,000 owed for the settlement of oil claims.

**Relations with the United States.** In reply to United States Ambassador George Messersmith's inquiry concerning labor leader Lombardo Toledano's statement that United States concerns were supplying arms to rightist political factions, the Mexican Government on January 5 said there was "no basis" for the charge and disavowed Toledano's statements.

Mexico blacklisted eight of the United States on February 16 after Washington requested an extension of the 1943 United States-Mexican agreement whereby Mexico supplied workers during the war years to alleviate the labor shortage in United States agriculture. Because of alleged discrimination and contract abuses, Colorado, Illinois, Indiana, Michigan, Minnesota, Montana, Wisconsin, and Wyoming were deprived of Mexican crop pickers. The United States' request stated a need for 50,000 workers.

The high tariffs and import controls imposed by Mexico during the closing months of 1945 were sharply criticized on February 12 in a speech by Merwin Bohan, economic counselor to the American Embassy in Mexico City. Voicing the attitudes of the United States Department of State, Mr. Bohan said that the controls hurt American exports in Mexico and encouraged an economic dislocation that would be reflected in increasing hardships created by artificial scarcities and the fostering of unsound industries. The desire of the Mexican government to nurture infant industries by subjecting thousands of items, only a fraction of which are manufactured locally, to import licenses, was attacked as excessive protectionism by Mr. Bohan.

Luis Quintanilla, Mexican representative on the governing board of the Pan American Union and former Mexican ambassador to the Soviet Union, caused his government no little embarrassment late in March when he stated that: "Real (Latin) American democracies would denounce Pan American ties if hemispheric policy should become involved in creating an English-speaking axis against our great Soviet ally." Mexico City newspapers interpreted the statement as a clear backing of the Soviet Union if any conflict occurred and Quintanilla was recalled by his Government for explanation.

On June 25 United States and Mexican delegations met at Mexico City to discuss measures intended to improve air traffic between the two nations. The meeting was called to define regulations and licenses to govern the various airlines which were engaging in increasing competition. The discussions made little progress for on July 13, Oswald Ryan, vice chairman of the Civil Aeronautics Board and chief of the United States delegation, announced that an impasse had been reached on

basic issues and that Mexico was reluctant to admit additional competing airlines. Until an agreement could be reached, the United States withheld permission to the Mexican lines for extension of service into the United States.

**International Relations.** The Mexican Foreign Office insisted on July 30 that its exclusion from the Paris Peace Conference constituted a violation of the United Nations declaration against concluding separate peace treaties with the enemy. Mexico argued that although she did not prosecute the European war "with considerable military force"—as required by the Moscow Conference of December, 1945—her relations with Italy had always been strong and her contributions in materials and manpower to the war effort at home had been considerable. Dr. Francisco Castillo Najera, Foreign Minister, announced that Mexican Ambassador Alfonso Rosenzweig Diaz in Paris had tried in vain to see United States Secretary of State Byrnes to press the Mexican case.

In a United Nations meeting at Lake Success, New York, on October 2, Mexico submitted an atomic energy proposal that met wide approval. The proposal requested the Political Committee of the Atomic Energy Commission to determine the feasibility of international control over all plants producing atomic energy which could be used for weapons, while the individual nations controlled the operation of secondary plants producing atomic fuels for peaceful use. A week later scientists of the Commission's No. 1 committee informally decided that the Mexican plan held political implications beyond the scope of its deliberations and referred it to the No. 2 (political) committee of the Commission for study.

**National Economy.** Mexico's economy is based upon agriculture and mining. Corn is the principal crop and staple food. Other important domestic crops are: beans (second in importance), wheat, sugar, cotton, rice, chickpeas, and fruits. Food crops exported in significant amounts include bananas, coffee, and winter vegetables. Stock raising is also an important industry; recent estimates indicate that Mexico has 12 million cattle and 5 million hogs. Henequen, produced in Yucatán, is the chief fiber raised, but others are grown in small quantities. Forest products include chicle, wild rubber, copra, and lumber. Production figures for 1944 for leading agricultural crops: corn, 2,440,483 metric tons; rice, 118,409 metric tons of paddy; bananas, 440,465 metric tons. For 1944-45: wheat, about 396,467 metric tons; sugar, 372,875 metric tons; cotton, 495,988 bales.

Minerals constitute a large part of Mexico's exports, and equipment for mines accounts for a good part of its imports of capital goods. Mexico's major mineral product by value is silver; it leads all other countries as an exporter of this metal, and produces 40 percent of world output. Petroleum, lead, and gold are other important minerals, and copper, zinc, mercury, tin, antimony, iron, tungsten, manganese, bismuth, and cadmium are also produced. Crude petroleum production in 1944 amounted to 36,120,000 barrels; refined oil was valued at 337,687,000 pesos. Other mineral production in 1945, in metric tons: zinc, 209,940; lead, 205,314; iron, 208,148; copper, 61,680; manganese, 18,542; antimony, 8,754; silver, 1,900; molybdenum, 781; mercury, 567; tin, 177; tungsten, 64; bismuth, 161; gold, 15.

Manufacturing in Mexico is chiefly confined to consumer goods, with little development in the heavy industries. In the past 2 years, however, Mexico's industrial growth has been phenomenal,

and there are now over 28,500 factories employing more than 512,000 persons. The cotton textile industry has recently reached major proportions as a national industry. It includes some 200 mills with a capital investment of about 150,000,000 pesos. Sales value of production in 1944 amounted to 480,000,000 pesos. Silk and rayon textiles are also made. Processing of foods is an important industry, and in addition, such articles as cigarettes, leather goods, cement, paper, and glassware are manufactured.

**Foreign Trade.** Mexican exports in 1945 were valued at 1,332,666,000 pesos. Commerce during the war years was almost exclusively confined to the United States, imports and exports to that country both reaching 85 percent of the total value in 1944. Merchandise exports to the United States in 1945 amounted to 1,116,589 pesos. Major exports consist of raw materials, principally metals.

Mexican imports in 1945 were valued at 1,603,404,000 pesos. In 1945 Mexican imports from the United States reached 1,321,528,000 pesos. The value of imports of agricultural, mining, and industrial machinery increased from 67,000,000 pesos in 1940 to 537,976,000 pesos in 1945. Imports consist chiefly of manufactured and semi-manufactured goods, and foodstuffs.

JOSEPH P. BLANK.

**MIDWAY ISLANDS.** A group of islets located in the Pacific, 1,304 statute miles northwest of Honolulu. Although Midway was discovered by Captain N. C. Brooks in 1859 and known as Brooks Island, the name was later changed because of the position of these islands in the mid-Pacific, i.e. 2,800 miles from California and 2,200 miles from Japan. It was formally declared a United States possession on Aug. 28, 1867 by Captain Reynolds of the U.S.S. *Lackawanna* who made a survey of the islands.

The U.S. Navy Department has had complete jurisdiction over them since July 4, 1903. The total land area of all the islets is approximately 28 square miles. Sand Island is one and a half miles long and one mile wide consisting of 850 acres and serves as an important cable relay station of the Commercial Pacific Cable Company in the service between San Francisco and Shanghai. Eastern Island is somewhat smaller than Sand and contains only 328 acres. Midway Islands have been used as a naval air station and as an air depot between Nov. 24, 1935, and Dec. 7, 1941, by Pan American Airways on their transpacific route between San Francisco and Manila. The population of Midway has always been small, in 1940, it was 437.

**MILBANK MEMORIAL FUND.** A Fund established in 1905, with assets of \$9,706,642.70 at the end of 1945. Appropriations for grants and projects in that year totaled \$240,778.65. The scope of the Fund, while widely diversified, has been principally in the field of public health. At present its special interests in this field are nutrition, housing, population trends, and the appraisal of public health methods and procedures. In 1945 twenty-seven organizations received funds. President: Albert G. Milbank. Executive Director: Frank G. Boudreau, M.D. Offices: 40 Wall Street, New York, New York.

**MILITARY GOVERNMENT. Germany.** The policy of the United States in regard to the occupation of Germany was first published in a joint report issued on February 11, 1945 after the Chiefs of State of the United States, United Kingdom, and the Union of Soviet Socialist Republics had conferred at Yalta

early in that year. At this conference it was decided "that France should be invited by the three powers, if she should so desire, to take over a zone of occupation."

In April 1945, a document known as J.C.S. 1067 was issued by the Joint Chiefs of Staff of United States in the form of a directive to General Eisenhower, the Commander in Chief of the U.S. Forces of Occupation. This document and the following Potsdam Declaration of the three powers, August 2, 1945, has formed and provided for the implementation of the United States policy in Germany. The American policy was further clarified in the speech of Secretary of State Byrnes in Stuttgart in Germany on September 6, 1946.

**Organization of Military Government for Germany.** The Allied Control Authority (A.C.A.) is the supreme governing machinery for Germany while the basic requirements of the unconditional surrender are being fulfilled. It consists of the following organizations:

**a. Control Council**

This Council is composed of the four Commanders of the occupation forces of the four Allied Nations governing Germany, i.e., United States, United Kingdom, Republic of France, and the Union of Soviet Socialist Republics. Decisions affecting Germany as a whole must be unanimous. The Chairman of the Council rotates monthly.

**b. Coordinating Committee**

The Coordinating Committee is composed of the four Deputy Military Governors and is responsible to the Control Council. It recommends action to and implementation of the decisions of the Control Council.

**c. Allied Secretariat**

The Secretariat consists of the four national Secretaries and is responsible for agreeing on the Agenda and Minutes of Meetings of the Control Council and Coordinating Committee. It also translates papers into the official languages and performs other like administrative duties.

**d. Control Staff**

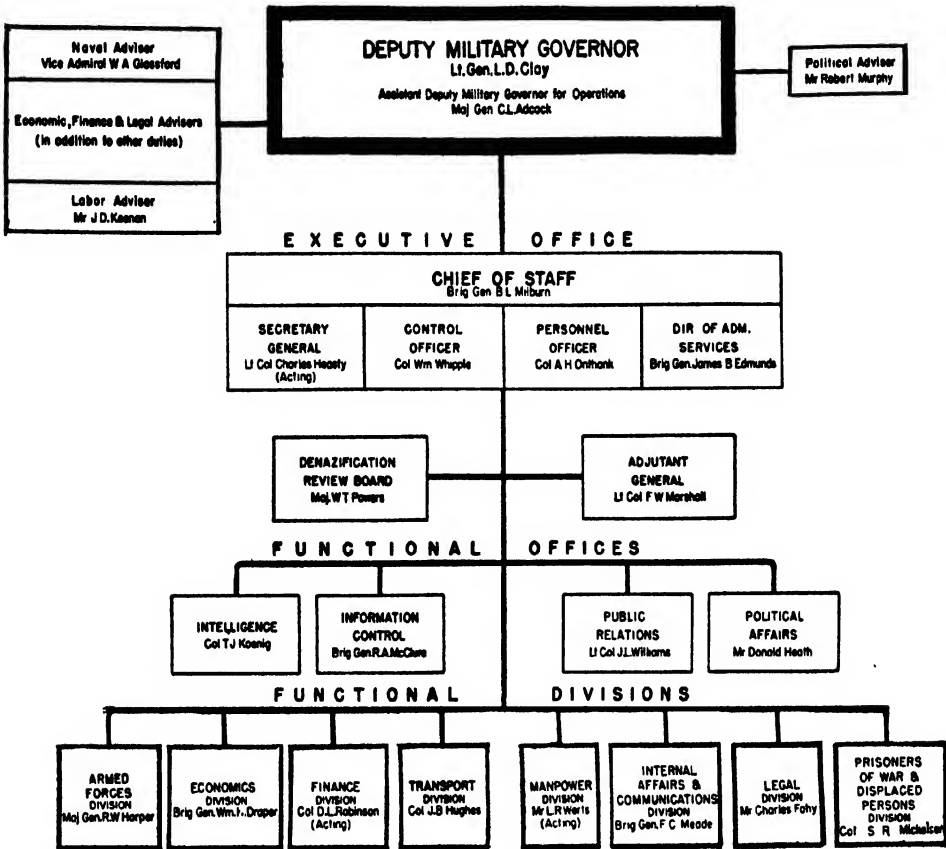

The Control Staff is formed by twelve quadripartite directorates responsible for operational functions, which are Air, Naval, Military; Reparations, Deliveries and Restitution; Political; Transport, Finance; Legal; Prisoners of War and Displaced Persons, Manpower, Internal Affairs and Communications; and Economic. These directorates act as special advisory bodies to the Coordinating Committee.

**Organization of Military Government in the U.S. Zone.** The responsibility for implementing the decisions of the Control Council in the U.S. Zone rests with the Office of Military Government for Germany (U.S.), (OMGUS). The Commanding General of OMGUS is the Deputy Military Governor. He has a political advisor who counsels him on political problems in Germany and on broad U.S. policy in relation to Germany.

The Staff of the Office of Military Government consists of executive and functional offices and of various functional divisions which advise the Military Governor on their particular field of activity.

Directly responsible to OMGUS are the Office of Military Government for Berlin, U.S. Sector, Office of Military Government for Bavaria, Office of Military Government for Bremen, Office of Military Government for Wuertemberg-Baden, Office of Military Government for Greater Hesse. Each of the three land (state) offices maintains liaison and security offices in each *landkreis* (county) and *stadtkreis* (city), within its area of jurisdiction.

**German Civil Government, U.S. Zone.** In each of the three *laender* (states) of the U.S. Zone there is a German administration consisting of a Minister President and a Cabinet. The responsibility for government has gradually been placed in their hands. On January 30, 1946, zone-wide elections were held, in which town councils (*gemeinderäte*) were elected in all towns with a population of less than 20,000. These councils then elected a mayor (*bürgermeister*), subject to the approval of Mil-

U.S. War Department

## OFFICE OF MILITARY GOVERNMENT FOR GERMANY (U.S.)

tary Government. On April 28, the rural counties elected their councils (*Kreistag*) who in turn elected the *Landrate* (heads of the county administration). On May 26 the cities with a population of more than 20,000, elected the city councils who in turn elected mayors (*bürgermeisters*). On June 30 members of the Constitutional Assembly in each land were elected and began the work of drafting constitutions for their respective states. Supervisory control is maintained by the Offices of Military Government of the respective lands.

**Council of Minister Presidents (Laenderrat).** This Council consists of the Minister Presidents of each land in the U.S. Zone and has its seat in Stuttgart. There is a permanent representative of each state and a staff of directorates and secretaries. It functions as a common agency for matters requiring coordination of the three laender of the U.S. Zone. It operates under the supervision of the Regional Government Coordinating Office, a special Military Government agency directly responsible to the Deputy Military Governor.

**German Legislation (U.S. Zone).** The most important piece of German legislation enacted since the unconstitutional surrender, is the "Law for Liberation from National Socialism and Militarism," which was promulgated by the *Laenderrat* and approved by OMGUS on March 5, 1946. This law places the responsibility for over-all denazification on the German administration. Under the law, all residents of Germany must register, giving in detail their affiliations with the N.S.D.A.P. and its

subsidiary organizations, and with the *Wehrmacht*. Each individual is then classified as one of the following by a tribunal (*Spruchkammer*) composed of known anti-Nazis: (1) Major Offender; (2) Offender (Activist, Militarist, or Profiteer); (3) Minor Offender; (4) Follower.

Mandatory and optional sanctions are then imposed by the tribunal ranging from ten years imprisonment at forced reconstruction, loss of civil rights, and confiscation of property for Major Offenders, to loss of civil service rank and varying degrees of confiscation of property and fines for reparations, for Followers.

**Political Life in the U.S. Zone.** In accord with the policy set forth in the Potsdam Declaration of reviving democratic life in Germany, political parties which were democratic in character have been authorized. In the beginning, the parties were local in character, confining themselves within the borders of each county (*landkreis*). Later, they were authorized by Military Government to organize on a state (*land*) level.

The Christian Democratic Union (Christian Social Union in Bavaria), the Social Democratic Party, and the Communist Party are organized in each land. In addition, the Liberal Democratic Party is organized in Great Hesse, having its counterparts in the Free Democratic Party in Bavaria and the Democratic People's Party in Wuerttemberg-Baden. The Economic Reconstruction Party has organized only in Bavaria.

**Civil Administration.** The first formal zone-wide

political party was organized on September 28-29 at Stuttgart when the Democratic People's Party was formed by the union of the Free Democratic Party (Bavaria), Liberal Democratic Party (Greater Hesse), and Democratic People's Party (Wuerttemberg-Baden). The other parties have so far been satisfied with cooperation through informal zonal "working committees."

The Constitutional Assemblies of the three *Laender* have been considering drafts of election laws to cover the coming referendum and *Landtag* (legislature) elections. Present indications are that election regulations will be almost identical with those which governed the elections on June 30 for the Constitutional Assemblies. The referenda on the proposed constitutions will probably occur on November 24 and December 1.

Local council elections in Mecklenburg and Brandenburg in the Soviet Zone on September 15 produced results little different from those in the earlier elections in the rest of the Soviet Zone on September 1 and 8, which were discussed in Report No. 14 of the Military Governor. The Socialist Unity Party (SED) was generally ascendant, particularly in the rural areas. This was expected, in view of the fact that only the SED had full opportunity to solicit support for its program.

The conservative inclinations of the population of the French Zone were reflected by substantial margins given the Christian Democratic Union. In the British Zone most of the vote was split between the Christian Democratic Union and the moderate Social Democratic Party.

The Soviet, French, and U.S. Zones have approved for elections in their Zones the basic municipal election codes of the *Weimar* period. In the British Zone, however, elections have been conducted under a code that embodied a good deal of election methods new to Germany.

One of the more important of the twelve quadripartite Control Staff Directorates is the Economic Directorate. According to the annual report, July 1945-June 1946, of Brig. Gen. William H. Draper, Jr., Director of the United States Economic Division, the Economic Directorate takes the various problems connected with the occupation of Germany and tries to settle them in terms of the basic policies agreed to by the governments of the Four Powers. To do this job, the directorate is organized into seven committees—Food and Agriculture, Industry, Central German Administration, Trade and Commerce, I. G. Farben Control, Fuel, Liquidation of German War Potential—upwards of a dozen subcommittees, and numerous of working parties of the basic policies agreed to by the governments of the Four Powers.

On August 15, 1945, two weeks after signing of the Potsdam Declaration, the Economic Directorate met for the first time, at which meeting there was considerable discussion about the basic principles laid down in the Potsdam Declaration. In its 50-odd meetings since that time, the Economics Directorate has played a vital part in endeavoring to implement those principles. For Reparations, Deliveries, and Restitution Directorate see REPARATIONS.

**Collapse of Economy in July, 1945.** In July the four occupying powers were confronted with an almost complete collapse of normal agricultural and food distribution operations. Harvesting was disorganized; an acute labor shortage existed; essential farm supplies, such as fertilizer, seed, tools, binder twine, and sacks were almost unobtainable. Damage to processing plants and disruption of transportation facilities, prevented processing and distri-

bution of such foods and farm supplies as existed.

**Reorganization of Institutions.** The reestablishment of basic administrative machinery was the first step necessary to restore the German agricultural and food economy to a more normal operating basis. This task has been accomplished through restoration and partial reorganization of German agencies at *Land*, *Kreis* and *Gemeinde* levels to control the production and distribution of food. A Food and Agriculture Administration or Ministry has been established in each of the three *Laender* of the U.S. Zone.

Early in April provision was made for reestablishment of agricultural cooperatives on a democratic basis in all four Zones of Germany. Cooperative associations have played an important role in German agriculture. During the war, the activities of cooperatives were restricted or, in certain instances, suspended. The Nazis used them entirely as an instrument of Nazi domination, robbing them of their democratic character. Standards to be applied in the future development of cooperatives will be based on the principle of voluntary membership without regard to race or creed and officials will be elected in accordance with democratic principles. For the time being activities of cooperative associations are confined to the territorial jurisdiction of a single *Land*. On account of the serious food situation the office of a Commissioner for Food and Agriculture in the U.S. Zone was created in April. In accordance with Military Government policy, operating responsibility for all phases of the established food and agricultural program has been turned over to German organizations as rapidly as possible.

**Food Rationing.** At the beginning of the occupation period food rationing was handled on a *Land*, or in some cases a *Regierungsbezirk*, level. Consumer categories varied among different *Laender*. Ration scales were low. A uniform system of classification of consumers and uniform ration scales for each consumer category have been in effect since November 12, 1945.

Before VE-Day the amount of rationed food actually distributed to the normal consumer had fallen to 1,050 calories per day, representing the lowest per capita consumption of food since World War I. Immediately after VE-Day this amount dropped precipitately to an average of about 860 calories per day.

On April 1 food rations in the U.S. Zone were cut from 1,550 to 1,275 calories per day for the normal consumer, with corresponding reductions for other consumer groups. This ration scale was the lowest for the U.S. Zone since October 1945, and compared with an authorized ration of 1,043 calories per day for normal consumers in the British Zone and 940 calories per day for the French Zone. In May, pending definite import commitments for the last half of 1946, German authorities recommended and Military Government approved, a further reduction in the ration for the normal consumer in the U.S. Zone to 1,180 calories per day. Later ration-scale changes were slight.

At the time the joint occupation of Berlin was planned, it was not contemplated that the United States would be responsible for feeding its sector of the city. Soon after U.S. Forces arrived, however, it became evident that the United States would have to share in the responsibility for feeding the city. The city is governed jointly by the four occupying powers. A joint Food Agreement entered into by the *Kommandantura* (the military commanders of the four sectors of the city) forms the basis of feeding operations.

The pattern for ration scales had already been set by the U.S.S.R. when Military Government began to share in operations in July. Consumers are divided into five classes depending upon the kind of work in which they are engaged.

- Group I—Heavy workers and professional workers of note (2,478 calories daily)  
 II—Manual workers and certain other classes of professional workers (1,975 calories daily)  
 III—Employees not contained in Groups I and II (1,591 calories daily)  
 IV—Children up to 14  
     0—1 year (1,783 calories daily)  
     2—6 years (1,648 calories daily)  
     7—9 years (1,612 calories daily)  
     10—14 years (1,548 calories daily)

**Crop and Land Use Plan.** The crop production goal for 1946 refers as a basis to the 1937–38 crop year, which generally represents the highest yield and maximum use of arable land for Germany in recent years. The 1946 program provided for conversion of approximately 70,000 hectares of meadow and pasture to crop land, or about 63 percent of the total land that had reverted to grassland since 1938.

Under its provisions as many direct-consumption crops as possible have been planted. These include such crops as potatoes and sugar beets, which have a relatively high yield in terms of food calories. The 1946 goal for early and late potatoes, perhaps Germany's most important food crop was 511,000 hectares in comparison with 419,000 hectares in 1945. The planned hectareage for 1946 crops in the U.S. Zone is shown in the following table in comparison with areas under cultivation in earlier years:

AREA OF CULTIVATED CROPS—U.S. ZONE

Crops	1938	1943	1945	1946*
		(Thousand hectares)		
Bread grains . . . . .	1,194	1,062	982	1,125
Potatoes . . . . .	513	445	419	511
Other direct food crops . . . . .	239	257	217	278
Other crops . . . . .	1,784	1,782	1,782	1,586
Total . . . . .	3,730	3,546	3,400	3,500

\* Planned

**Livestock Plan.** A livestock program for 1946 has been established for the U.S. Zone. This program calls for selective culling to bring the livestock population into line with reduced areas of feed and fodder crops and to eliminate less profitable animals. Numbers of hogs and poultry have declined sharply in recent years, but it is not practicable to increase hog and poultry production under present conditions of total food shortage, since the food required will yield more calories in direct human consumption.

**Industry in the U.S. Zone.** From July 1945 through June 1946—industry in the U.S. Zone progressed despite numerous interruptions and setbacks from what amounted to a practical standstill to an operating level somewhat under one-third of estimated capacity.

Progress during the year in the U.S. Zone has been greatest in the basic industries, electric power, coal, iron and steel. Most of the gains in ferrous metals were made in the second quarter of 1946. As the stimulating effect of more steel permeates industry, output in plants heretofore restricted by steel shortages should expand.

By July 1945, more than three-fourths of the rail tracks in the U.S. Zone had been restored. But railroad facilities were being used almost wholly for military traffic and for the return to their homes of millions of displaced persons.

From July through December 1945, the main ef-

forts of industry were devoted to housecleaning and repairs. The rubble resulting from bombing and the debris left as a result of invasion were removed from plants and equipment. As non-war plants were authorized to begin operations by Military Government, the first productive steps toward resumption of manufacturing activity were undertaken. The fact that many manufacturers had accumulated large amounts in cash before the collapse facilitated the meeting of non-productive payrolls.

During the summer and early fall of 1945, before railroads and waterways were able to cope with more than a fraction of high priority German civilian traffic, road transport played a major part in moving goods necessary to maintain a minimum of essential civilian production, notably food. Despite shortages of tires, tubes and batteries, the 37,000 trucks and 20,000 trailers then available in the U.S. Zone proved able to cope with the task. Improved coordination between Military Government and the German authorities and among the Germans themselves was an important factor contributing to the progress made in all economic fields.

With the slow but steady improvement of coal output in the Ruhr, which continued throughout February, the U.S. Zone received solid fuels at the rate of about 1,000,000 tons a month in the first quarter. The sharp drop in coal output in the Ruhr in March, following the radical curtailment of food rations in the British Zone, was not wholly reflected in a decline in coal shipments. This was made possible by heavy withdrawals from the considerable stockpiles of coal built up in the Ruhr during the fall and winter of 1945–46 when transport facilities were unable to move coal from the mines as fast as it was being produced. As a result, the weekly average of solid fuel loadings to the U.S. Zone in May were 3 percent above those of February.

The basic ground work laid in 1945 in the industrial field, accompanied by improvement in the closely related fields of transportation, communications and manpower, has continued to contribute to industrial recovery throughout the first six months of 1946. June production is estimated to be about 29 percent of operable industrial capacity excluding war plants in the U.S. Zone.

Other significant developments in fields related to industry and contributing to the revival of manufacturing activity, were the establishment of inter-zonal telegraph and telephone service between the three western zones in January, followed in February by inclusion of the Soviet Zone, thus restoring telegraph and telephone service on a Germany-wide basis. The reestablishment of international mail service between Germany and foreign countries (excluding Spain and Japan) on April 1, 1946, is still limited to personal mail and thus has psychological rather than direct economic significance. In February, the first commercial export sales from the U.S. Zone were concluded. In April, the inland waterway transport system had been restored sufficiently to perform its normal functions.

**Labor in Industry.** Since January, unemployment figures in the U.S. Zone have shown a continuous downward trend with a simultaneous upward trend in labor registration.

In all of present-day Germany, the total able-bodied men available for work (ages 14–65) are estimated to be about 6,000,000 fewer than in the same area in 1939. This shrinkage takes into account military casualties, prisoners-of-war not yet returned to the German economy and German men

still outside of Germany. In the U.S. Zone, the total male labor force in May 1946, including the employed and employable unemployed, was about 3,500,000 as against about 4,500,000 seven years previously, a shrinkage of about 22 percent. The labor pool on which U.S. Zone manufacturers may draw has been further reduced by the larger employment in agriculture which, in May 1946, was 65 percent above that of May 1939.

**Land Economic Administration.** In Bavaria and in Greater Hesse there are separate Ministers for Economics and for Food and Agriculture. In Wuerttemberg-Baden the Minister of Economics is also responsible for food and agriculture. The Minister of Economics in each *Land*, under the Minister President, is responsible for industry, trade and commerce, price control, and control of scientific research, and is responsible for insuring that Trade Associations, Chambers of Industry and Commerce, and Handicraft Chambers are organized and operate in accordance with established policies and do not exceed their authorized powers.

**The Laenderrat.** The Minister Presidents were authorized in November 1945 to organize the *Laenderrat* as the means for obtaining necessary co-ordination within the U.S. Zone. The *Laenderrat* consists of the Council of the Minister Presidents which meets once a month, a Directorate composed of two delegates from each Land and the Secretary General, a permanent Secretariat, and numerous committees. The Directorate has been authorized by the Minister Presidents to take action on the all but over-all basic policy matters which are reserved for decision by the Council of Minister Presidents. Decision by the Directorate must be unanimous except in routine matters with respect to which a Land may waive its veto right.

The *Laenderrat* has been authorized by Military Government to effect direct contact with the German officials in the other zones. There are regular meetings between the German officials in the British and U.S. Zones, and permanent liaison has been established between the *Laenderrat* and the British Zone for economics and for food and agriculture.

**Internal Trade.** The slow revival of Germany's internal trade has been one of the major difficulties in the resurgence of the economy of the U.S. Zone of occupation. The industry of the former Reich was based upon mutual interdependence of industries located throughout Germany for raw materials, machine parts and semi-fabricated items. Hence, industry during the first months was only able to survive if stocks were available. There was a similar situation in agriculture with regard to seeds, machinery, and fertilizers. Thus the newly erected zonal boundaries of segmented Germany have been one of the major factors in the almost complete stagnation of internal trade. Pending elimination of these barriers and treatment of Germany as an economic unit, a number of makeshift arrangements for interzonal trade have been made. These have usually been two-party agreements, frequently on a barter basis, to permit partial restoration of the former natural division of labor and exchange of commodities between regions in which they can be economically produced.

**Eliminating Cartels and Monopolies.** On July 5th, 1945, I. G. Farben, the largest chemical firm in the world, Germany's major producer of war materials, builder and manager of most of the explosives and poison gas plants which fed the Hitler war machine, and known the world over as "a state within a state," ceased to exist in the U.S. Zone of Occupation.

#### IMPORTS INTO U.S. ZONE, GERMANY FOR PERIOD APRIL 1, 1945 TO APRIL 30, 1946

Item	Volume	Value in Dollars
1. Food (net long tons) . . . . .	485,485,000	\$101,896,937.80
2. Raw Materials (MT) . . . . .	210,524,000	15,648,564.87
3. Manufactured Goods		
a. Clothing (each) . . . . .	90,000	235,119.00
b. Medical Supplies (each) . . . . .	11,856	35,082.04*
c. Vehicles and Trailers (each) . . . . .	7,600	6,970,142.00
		\$124,285,845.71

\* Value of Medical Supplies does not include value of nine hospitals presently being turned over to German civilians, as all quantitative receipts have not reached this branch to date and detailed prices are unavailable.

#### EXPORTS FROM U.S. ZONE, GERMANY FOR PERIOD AUGUST 1, 1945 TO APRIL 30, 1946

Item	Quantity in M. T.	Value in Dollars	Purchasing Country
Butylacetate	16 320	\$ 3,835.20	Czechoslovakia
Hops	1,370 938	3,606,460.59	Belgium; USA *
Photographic Gelatine . . .	50,446	111,813.25	Belgium
Potassium Sulphate . . .	1,052 000	74,739.66	Czechoslovakia
Potassium Magnesium . . .	1,514 000	47,569.88	Czechoslovakia
Salt . . .	1,892 900	8,125.92	Czechoslovakia
Sand . . .	156 000	1,482.00	Belgium
Total . . .	6,452,604	\$3,854,026.50	

\* Belgium 500 177 M. T.; USA 870 761 M. T.

**NOTE** Above items do not include various exports to Czechoslovakia, Belgium, Luxembourg and Netherlands prior to October 31, 1945. These export transactions were accomplished on the basis of quantitative receipts being signed by recipient governments and to date no financial settlements have been made or prices obtained. Imports-Exports Section is presently consolidating on a quantitative basis all such available receipts and has further requested that all foreign embassies forward to their office any quantitative receipts executed on purchase of exports from the U.S. Zone, Germany. Necessary action will be taken by Imports-Exports Section to insure that quantitative receipts have been obtained on all exports prior to submission to Supply Accounting Branch for final processing.

On that date United States Army officers seized and took over the management of 42 major manufacturing plants, 56 sales offices and 26 miscellaneous installations, all of them in the American Occupation Zone and representing approximately ten percent of the vast I. G. Farben empire in Germany. Parallel action was taken in the other three Zones of Occupation on different dates, and was confirmed by the passage of Allied Control Council Law No. 9.

**Austria.** The treatment of Austria as a liberated rather than a conquered country stems from the Moscow Declaration, November 1, 1943, which states in part, "Austria, -----, shall be liberated from German domination." In that document, the United States, Union of Soviet Socialist Republics, and the United Kingdom stated that they wished to see established "a free and independent country." Thus, the policy toward Austria has been, from the first, positive and constructive.

Early in July 1945, the European Advisory Committee in London concluded the agreements on control machinery for Austria and the zones of occupation.

Late in August 1945, the Headquarters, United States, Forces in Austria, was moved to Vienna from Salzburg. French and Britain headquarters were moved to Vienna at the same time and on September 1, Vienna came under quadripartite control.

Politically, a Provisional Government for Austria had been established by the Soviets in April 1945, under Dr. Renner. The power of the Provisional Government was extended throughout Austria on October 20. All acts of this government had to be

approved unanimously by the four Members of the Allied Council.

On November 25, 1945, a free and fair election was held for a national parliament and provincial legislatures. Approximately 93 percent of the registered vote was cast. A majority of the seats in the parliament and in all the provincial legislatures went to the People's Party. The Socialist Party was a close second and the Communists a poor third. Dr. Renner was elected Federal President and Dr. Figl of the People's Party became Federal Chancellor. The cabinet was organized on a coalition basis, with all three parties participating.

The most important political development of the year 1946, to date, has been the approval on May 24 by the Allied Council of the New Control Agreement for Austria, and its approval by the Governments of the Four occupying Powers on June 28.

The major political point of the New Control Agreement is that, except for constitutional law, acts passed by the Austrian government became law thirty-one days after passage unless unanimously rejected by the Control Council. This reverses the previous condition under which unanimous consent was required of the Control Council. The New Control Agreement is a major step forward in returning the control of Austria to the Austrians.

**Italy.** At the close of December 1945, Allied Military Government came to an end except in the Province of Udine and Venezia Giulia. AMG had followed the advance of the armies from Sicily to the north of Italy, progressively turning over territory under its control to Italian administration as quickly as military conditions and the ability of the national government to assume responsibility would permit.

The retention of Allied Military Government in Venezia Giulia and Province of Udine was made necessary by the conflicting claims of Yugoslavia and Italy. Venezia Giulia has been divided into Zones A and B by the establishment of the so called "Morgan Line," pursuant to an agreement between Field Marshal Sir Harold Alexander and Marshal Tito. On August 11, 1945, local government in Zone A was established under the control of AMG of XIII Corps.

The Allied Commission in Rome continued in its role of advising the Italian Government and of maintaining a watch on public safety and the communications and transportation facilities of the civil economy. The rights obtained by the Allies under the Armistice were held in reserve and not fully exercised. Except for one General Court held at Naples during the first quarter of the year, Allied Military Tribunals ceased to function outside of Venezia Giulia and Udine.

In June a general election was held throughout Italy (except Venezia Giulia and Udine), and a referendum on the issue of monarchy or republic. Revised armistice terms which were agreed to be the Conference of Foreign Ministers at Paris on May 16, 1946 were presented to the Italian Government on June 1, 1946, but that government has not yet acted upon it.

**Japan.** The basic policies for the military occupation and post-surrender government of Japan are set forth in the Potsdam Declaration issued on July 26, 1945 by the United States, China, and Great Britain and subsequently adhered to by the Union of Soviet Socialist Republics; the Instrument of Surrender signed by the Japanese on September 2, 1945; the Moscow Agreement between the United States, Great Britain, and the Union of

Soviet Socialist Republics, with the concurrence of China, in December, 1945; and directives on Post-Surrender Policy issued by the Joint Chiefs of Staff of the United States.

By agreement of the United States, China, Great Britain, and the Union of Soviet Socialist Republics, General of the Army Douglas MacArthur was designated as the Supreme Commander for the Allied Powers for the purpose of enforcing the surrender of Japan.

The Moscow Agreement provided for the establishment of the Far Eastern Commission and the Allied Council for Japan to participate with the Supreme Commander in the creation and implementation of Post-Surrender Policy in Japan.

The Far Eastern Commission is composed of representatives of the Union of Soviet Socialist Republics, United Kingdom, United States, China, France, the Netherlands, Canada, Australia, New Zealand, India, and the Philippines. This Commission sits in Washington, D.C., formulates policies, principles, and standards in conformity with which the fulfillment by Japan of its obligations under the terms of surrender may be accomplished; reviews directives issued to and action taken by the Supreme Commander involving policy decisions within the jurisdiction of the Commission; and considers such other matters as may be assigned to it by agreement among the participating governments. The Commission does not make recommendations with regard to the conduct of military operations and respects the existing control machinery in Japan, including the chain of command from the United States Government to the Supreme Commander's command of occupation forces.

The Allied Council for Japan is composed of representatives of the United States, China, United Kingdom and the Union of Soviet Socialist Republics, under the Chairmanship of the Supreme Commander (or his Deputy) who is also the United States member. The Council consults with and advises the Supreme Commander in regard to the implementation of the terms of surrender and the occupation and control of Japan. The Supreme Commander is the sole executive authority, and as such issues all orders.

The decisions of the Supreme Commander are controlling on all matters except those regarding the implementation of policy decisions of the Far Eastern Commission on questions concerning a change in the regime of control, fundamental changes in the Japanese Constitutional structure, and a change in the Japanese government as a whole. If a member of the Allied Council disagrees with the Supreme Commander regarding the implementation of such policy decisions, the issuance of orders thereon must be withheld pending agreement in the Far Eastern Commission.

There was no intent under the Potsdam Declaration to destroy Japan as a nation, but it was provided that "The Japanese Government shall remove all obstacles to the revival and strengthening of democratic tendencies among the Japanese people. Freedom of speech, of religion and of thought, as well as respect for the fundamental human rights shall be established." In conformity with this policy, Military Government as established in Japan, has utilized the Japanese administrative machinery and, so far as practicable, Japanese public officials, making these officials responsible for the carrying out of the policies and directives of the military government, which are designed to enforce the terms of the Potsdam Declaration and the Document of Surrender. All persons who have been flagrant exponents of militant nationalism and ag-

gression or are for any other reason undesirable, have been removed or barred from holding public office or any other position of responsibility or influence in the Japanese Government.

To accomplish the supervision and control required in matters of government, the Supreme Commander of the Allied Powers has created a special staff with sixteen separate Divisions devoted to all phases of government and civil affairs administration. All directives to the Japanese Government are transmitted by the Supreme Commander through the Japanese Control Liaison Office. The Supreme Commander is empowered to take direct action if and to the extent that Japanese authorities fail satisfactorily to carry out his instructions. See JAPAN.

As of July 2, 1946, it was estimated that 186,000 Japanese had been excluded from government service under the purge directives of January 4, 1946 issued by General Douglas A. MacArthur.

SCAP began releases of imported and surplus U.S. Army stocks of grain, flour and canned goods in April 1946. At first only a few prefectures were affected, but by August it was necessary to release imported foods in 23 prefectures. More than 400,000 metric tons of imported food were distributed efficiently by the Japanese Government under SCAP surveillance. This food not only prevented mass starvation but served as proof to the Japanese people that the Allied Powers were endeavoring in every way possible to aid in rebuilding a democratic Japan.

Fertilizer production has been doubled since January 1946. The agricultural program also included food conservation, land reclamation, increased grazing, technical advice directly to producers and the direction of more than 100 research projects.

The fishing industry had to overcome shortages of boats, nets, fuel oil and other supplies and equipment.

**Democratization of Japanese Life. Family Structure.** The feudal nature of the Japanese family structure is notorious. When the war ended the rights of the father as master of the household, the right of primogeniture and the legal and political incompetence of women were accepted concepts in the Japanese Civil Code. The first break in this system came when at the suggestion of SCAP the Imperial Diet extended the right of suffrage to women 20 years of age or more. 1,000,000 more women than men, or nearly 67 percent of all registered women voters, went to the polls on April 10 and 38 women were elected to the House of Representatives.

Further reforms are decreed in Article XIV of the proposed constitution which says: "Marriage shall be based only on the mutual consent of both sexes and it shall be maintained through mutual cooperation with equal rights of husband and wife as a basis. Laws shall be enacted considering choice of spouse, property rights, inheritance, choice of domicile, divorce and other matters pertaining to marriage and the family from the standpoint of individual dignity and the essential equality of the sexes."

Measures to protect the family by preventing the economic exploitation of women have also been introduced. By SCAP directive licensed prostitution was abolished and the binding of women by contract to the practice of prostitution was prohibited. Measures to protect the health of employed women and children were revived and reinvigorated.

**Industrial Reform.** During the war the Zaibatsu tightened their practically monopolistic control

over industry, more than tripling their assets, while the Government established control associations in almost every major industry with power to fix prices, make allocations, control expansion and consolidate plants. The Holding Company Liquidation Commission was established in August 1946 to dissolve Zaibatsu holding companies and to reorganize their subsidiary companies. Holding companies are to transfer their assets to the Commission and will cease to exercise control over the enterprises affected. The Commission will liquidate companies while protecting the interests of small shareholders.

To remove the complete domination of industry by control associations SCAP ordered the Japanese Government in August 1946 to dissolve all such associations, to repeal all pertinent laws and regulations and to create proper agencies within or under the Economic Stabilization Board to allocate materials to specific industries.

**Agrarian Reform.** Most of Japan's farmers work the land as tenants with resulting poverty and insecurity. Since the surrender efforts have been directed to eliminating monopolistic control of land and to encouraging small producers. In August 1946 the Cabinet approved a new program of land reform prepared by the Ministry of Agriculture and Forestry and submitted it to the Diet. This program is a constructive attempt to enable the tenants to become landowners on reasonable terms and to improve conditions for those who will continue to work as tenants. According to the Government's estimates almost 2,000,000 tenant farmers will be able to purchase about 80 percent of the land they now cultivate as tenants.

**Labor Reform.** During the war legislation designed to suppress and regiment labor was passed while protective standards for workers in factories were relaxed. In December 1945 the first labor union law in Japanese history was promulgated. It established the legal status of labor unions and protected workers from discrimination because of union membership. As a result of these actions more than 7,000 free labor unions with 3,000,000 members, mostly affiliated with two major national federations, were organized during the first year of the Occupation. A bill to establish machinery for conciliation, mediation and arbitration of labor disputes is being considered by the Diet.

**Political Structure.** The decision to utilize the Japanese Government in carrying out the terms of the Potsdam Declaration made it necessary for SCAP to eliminate all militaristic and ultra-nationalistic elements from public life. This was accomplished by the Purge Directive of January 4, 1946. Under its terms some 186,000 persons who had aided and supported the cause of the militarists were barred from public office. The Purge Directive stimulated the growth of healthy political parties. It made room for new men in politics among both the leaders and the rank and file. Their influence grew until all parties were fully committed to encouraging the democratic way of life.

In the April 1946 election 72 percent of the registered voters went to the polls. Since no party had a majority in the House of Representatives, a coalition of Liberals and Progressives was formed under Prime Minister Shigeru Yoshida. This Government has worked energetically for the passage of the proposed new constitution and has outlined a program of emergency measures to alleviate the economic crisis.

**Religion.** Legal restrictions on religious freedom were removed. Shinto, the state-supported, -controlled, -disseminated-and-inspired religion which

had been an effective tool of the militarists and ultra-nationalists, was purged of all objectionable elements.

Complete separation of the cult from the state was effected. State Shinto doctrines were eliminated from the schools and the use of Shinto symbols for propaganda purposes was forbidden.

Christian organizations were freed of wartime restrictions and the way was opened for the return of missionaries to Japan.

The Emperor in his rescript of January 1, 1946 renounced all claims and pretensions to divinity.

**Korea.** The chief difference in the problem of Military Government in Korea and Japan is that the former was left without an established Korean Government, when liberated from the Japanese, while a responsible government existed in Japan to carry out the directives of the Supreme Commander.

The Moscow Agreement of December, 1945 (Part III) provides for the joint participation by representatives of the U.S. Command in Southern Korea and the Soviet Command in Northern Korea in the formation of representative provisional government for Korea. A United States-Soviet Joint Commission was created for this purpose. The Moscow Agreement further provides that after the establishment of such provisional Korean government, a four-power trusteeship of Korea will be created, to be administered by the United States, China, the United Kingdom and the Union of Soviet Socialist Republics for a period of up to five years. Both the proposals of the Joint Commission and the desires of the provisional Korean government are to be considered in the development of democratic self-government in Korea under the trusteeship and the ultimate establishment of the national independence of Korea.

No provisional Korean government has been established to date, because the Joint Commission has been unable to agree upon the Korean democratic parties and social organizations that should be consulted to this end. The Soviet representatives claimed that only those parties and organizations which subscribe to the idea of "trusteeship" as set forth in the Moscow Declaration should be consulted. The United States representatives maintained that all democratic parties and social organizations should be consulted. In the interim, civil affairs in the area of Korea occupied by United States forces have been administered by the Commanding General, U.S. Army Forces, Korea (who is subordinate to the Commander in Chief, U.S. Army Forces, Pacific), through policy directives of the United States Government, and the area occupied by the Soviet Command is administered under policies of the Union of Soviet Socialist Republics.

Military Government, as established in the U.S. Zone, has utilized local, regional, and national agencies of existing government as far as possible. All Japanese and all Koreans who have been exponents of Japanese Nationalism and aggression have been eliminated from positions of responsibility or influence. As of April 1946, approximately 70,000 Japanese, the total number who were connected with Civil Service in Southern Korea in September 1945, had been removed.

Progress has been made in the development of democratic government in Southern Korea by the restoration of civil liberties to the people and the elimination of obnoxious laws and other vestiges of Japanese control. A legislature for Southern Korea is in process of formation.

**Elimination of Japanese Influence.** At the time of

the Occupation there were 625,957 Japanese in South Korea, and elimination of their influence was the most pressing task confronting Military Government. To remove all Japanese immediately, installed as they were in all positions calling for skilled administrators and technicians, would have created chaos. Registration of Japanese nationals in Korea was started in October 1945. A total of 179,277 Japanese military surrendered, were disarmed and were evacuated to Japan.

In addition to this evacuation of Japanese from South Korea proper, 221,867 have streamed into the American Zone from north of the 38th parallel and, with the exception of about 5,000 currently being processed for repatriation, have been returned to their homeland. Fewer than 300 Japanese remain as residents in South Korea today. Except for about 40 who have evaded registration, these are either qualified by marital ties to remain or are in such bad health that their repatriation must be deferred.

At the time of the initial occupation the Korean Civil Service, with the exception of some who had fled to Japan, numbered 70,000 while there were more than 130,000 minor Japanese employees.

These Japanese employees were rapidly eliminated. By the end of January, only 60 Japanese nationals remained in the Government service; today none remain.

Following the elimination of Japanese and known pro-Japanese Koreans from major public offices, elimination of Japanese influence from provincial and lower levels of government was finalized by a sweeping order dissolving all such governmental councils and impounding their records on March 24, 1946.

Pro-Japanese propaganda and nationalistic societies were eliminated. In the schools, used by the Japanese to the fullest extent for the dissemination of Japanese ideology, the Military Government removed 15,000 Japanese teachers and destroyed textbooks of a propagandistic nature.

In December 1945, an ordinance was published vesting title to all former Japanese property in the Military Government. Where formerly the vast majority of these properties contributed to Japanese economic life at the expense of Korea, they are now being utilized in the interests of the Korean people.

Reforms were instituted which completely de-Japanized the legal system of Korea. Many branches of the profession, notably the Korean Bar, have been reorganized; the procurator system has been modernized to center on prosecution rather than investigation; and all important court decisions and opinions are now made public.

**Governmental Organization.** The Military Government organization immediately after the Occupation consisted of a Military Governor, a Civil Administrator, a Secretariat and nine Bureaus. The Secretariat took over the functions of general affairs, foreign affairs, intelligence and information, civil service, army administration, property custody, planning and accounts. The Bureaus administered finance, mining and industry, agriculture and commerce, public safety, public health, education, justice, communications and transportation.

On January 4, 1946, tactical commanders were relieved of Military Government duties by the establishment of government on a territorial basis, a system under which it is still operating. On August 31, 1946, the Commanding General, USAFIK, requested the Military Governor to turn over actual operation of all departments of government to Koreans. Temporarily excepted from this directive are operation of the Materials Control Corporation,

property custody, and the Civilian Supply Program. In all other departments American military personnel will be left in only an advisory capacity as far as is practicable.

**Reinstatement of Koreans.** Although the Military Government which is administering Korea has gone through many changes, from the outset it has scrupulously followed a policy of reinstating Koreans in positions of responsibility. This policy has involved not only the reform of Korea's Civil Service but the progressive training of able Koreans for every position in national and provincial administration.

Utilization of Korean personnel has been stressed in all departments and activities of Military Government. Working with the military incumbent in every position is a Korean official of equal rank, while the majority of minor positions in government of all levels are occupied by Korean personnel. On February 14, 1946, Korean advice was introduced into the highest levels of administration by formation of the Representative Democratic Council, an advisory body to the Military Governor. All major political parties were invited to nominate members of the Council, and Dr. Syngman Rhee, famous Korean patriot, was nominated Chairman. By March 1946, the utilization of Korean personnel had progressed so far that the Bureau of Justice was able to withdraw all but a few top Military Government men and turn over operation to Koreans.

**Interzone Activity.** Negotiations of the United States-Soviet Joint Commission for Korea to implement pertinent phases of the Moscow decision of December 1945, came to an impasse due to the refusal of the Soviets to recognize the rights of free speech and opinion.

Russian delegates insisted that any Korean party representative who had ever expressed criticism of Trusteeship should be ineligible for consultation in forming the proposed Korean provisional government. The American position was that such an interpretation would deny the rights of free speech.

**MILITARY PROGRESS.** The influence of the Atomic Bomb, possessed in its entirety only by the United States, was a dominating factor in the military thinking and planning of every nation of the world. This new weapon, together with the yet untried biological and radioactive agents and coupled with guided missiles, threatens to alter radically the entire concept of warfare. Unless and until some form of effective international regulation and control is agreed to by the nations of the world, the matter of the use of these new methods in offensive operations and the problems of defense against them will continue to dominate the military plans of all countries.

Pending such an international agreement the United States continued its manufacture of atomic bombs while other nations worked on research and methods of production and sought new sources for the materials necessary for production.

Despite the advent of the new weapons and the research for still newer ones, there was no noticeable trend away from those forces which proved themselves so potent in past wars—the conventional ground forces with its modernized artillery and armored components, and the air forces which played so powerful a part in World War II. For 1946, at least, the new weapons were looked upon as additions to the military potentialities without any apparent diminution of the older means of warfare.

**Atomic Bombs.** The bombing of Hiroshima and

Nagasaki having been the only examples of the use of this new weapon under conditions of actual warfare, most detailed studies have been and are being made of the effect of the bombs in those cities.

On June 30, 1946, the War Department made public portions of the report compiled by the Manhattan Engineer District (the code name for the Department's atom bomb production project under the direction of Major General Leslie R. Groves, U.S. Army). The main conclusions of this report were as follows:

"1. No harmful amounts of persistent radioactivity were present after the explosions as determined by

"A. Measurements of the intensity of radioactivity at the time of the investigation; and

"B. Failure to find any clinical evidence of persons harmed by persistent radioactivity

"2. The effects of the atomic bombs on human beings were of three main types

"A. Burns, remarkable for (1) the great ground area over which they were inflicted and (2) the prevalence of 'flash' burns caused by the instantaneous heat radiation

"B. Mechanical injuries, also remarkable for the wide area in which suffered.

"C. Effects resulting from penetrating gamma radiation. The effects from radiation were due to instantaneous discharge of radiation at the moment of explosion and not due to persistent radioactivity (of either fission products or other substances whose radioactivity might have been induced by proximity to the explosions)

"3. The effects of the atomic bombs on structures and installations were of two types.

"A. Destruction caused by the great pressure from the blast; and

"B. Destruction caused by the fires, either started directly by the great heat radiation, or indirectly through the collapse of buildings, wirings, etc

"4. The actual tonnage of T.N.T. which would have caused the same blast damage was approximately of the order of 20,000 tons.

"5. In respect to their height of burst, the bombs performed exactly according to design

"6. The bombs were placed in such positions that they could not have done more damage from any alternative bursting point in either city.

"7. The heights of burst were correctly chosen having regard to the type of destruction it was desired to cause

"8. The information collected would enable a reasonably accurate prediction to be made of the blast damage likely to be caused in any city where an atomic explosion could be effected."

Subsequently the White House made public a report on "The Effects of Atomic Bombs on Hiroshima and Nagasaki" from the United States Strategic Bombing Survey, a civilian committee, under the chairmanship of Mr. Franklin D'Olier, which had been appointed in 1944 by the late President Roosevelt. An interesting portion of that report was the section "What We Can Do About It," from which the following extracts are taken:

"Since modern science can be marshalled for the defense as well as the attack, there is reason to hope that the protective weapons and techniques will be improved. Even protective devices and vigilance, however, cannot be perfect guards against surprise or initial attack, or against the unlimited choices of targets offered an enemy through the range and speed of modern weapons. In our planning for the future, if we are realistic, we will prepare to minimize the destructiveness of such attacks, and so organize the economic and administrative life of the Nation that no single or small group of successful attacks can paralyze the national organism.

"1. Shelters.—The most instructive fact at Nagasaki was the survival, even when near ground zero, of the few hundred people who were properly placed in the tunnel shelters. Carefully built shelters, though unoccupied, stood up well in both cities. Without question, shelters can protect those who get to them against anything but a direct hit. Adequate warning will assure that a maximum number get to shelters.

"The survival of sheltered sections of Nagasaki suggests forcefully the use that can be made of irregular terrain. Uneven ground reduces the spread and uniformity of blast effect. Terrain features such as rivers and parks afford natural firebreaks and avenues of escape.

"2. Decentralization.—Hiroshima and Nagasaki were chosen as targets because of their concentration of activities and population. The population density of 45,000 or

more per square mile of built up area explains in part the high casualty rate. Significant therefore is the fact that deaths at Nagasaki, despite the greater population density, were only one-half those at Hiroshima: the difference can be assigned in the main to the separation of the dispersed built-up pockets at Nagasaki, in contrast to the uniform concentration of the inhabitants in the heart of Hiroshima. The Nagasaki bomb thus dissipated much of its energy against hills, water, or unoccupied areas, while the Hiroshima bomb achieved almost optimum effect.

"The fate of industries in both cities again illustrates the value of decentralization. All major factories in Hiroshima were on the periphery of the city—and escaped serious damage; at Nagasaki, plants and dockyards at the southern end of the city were left intact, but those in the valley where the bomb exploded were seriously damaged.

"An enemy viewing our national economy must not find bottlenecks which use of the atomic bomb could choke off to throttle our productive capacity.

"3. Civilian Defense.—Because the scale of disaster would be certain to overwhelm the locality in which it occurs, mutual assistance organized on a national level is essential. Such national organization is by no means inconsistent with decentralization; indeed, it will be aided by the existence of the maximum number of nearly self-sustaining regions whose joint support it can coordinate.

"Most important, a national civil defense organization can prepare now the plans for necessary steps in case of crisis. Two complementary programs which should be worked out in advance are those for evacuation of unnecessary inhabitants from threatened urban areas, and for rapid erection of adequate shelters for people who must remain.

"4. Active defense.—Protective measures can substantially reduce the degree of devastation from an atomic bomb and the rate of casualties. Yet if the possibility of atomic attack on us is accepted, we must accept also the fact that no defensive measures alone can long protect us. At best they can minimize our losses and preserve the functioning of the national community through initial or continuing partial attack. Against full and sustained attacks they would be ineffectual palliatives.

"As defensive weapons, atomic bombs are useful primarily as warnings, as threats of retaliation which will restrain a potential aggressor from their use as from the use of poison gas or biological warfare. The mission of active defense, as of passive defense, is thus to prevent the surprise use of the atomic bomb from being decisive. A wise military establishment will make sure—by dispersal, concealment, protection, and constant readiness of its forces—that no single blow or series of blows from an enemy can cripple its ability to strike back in the same way or to repel accompanying attacks from other air, ground, or sea forces. The measures to enable this unrelaxing state of readiness are not new; only their urgency is increased. Particularly is this true of the intelligence activities on which informed decisions and timely actions depend.

"5. Conclusion.—One further measure of safety must accompany the other. To avoid destruction, the surest way is to avoid war. This was the Survey's recommendation after viewing the rubble of German cities, and it holds equally true whether one remembers the ashes of Hiroshima or considers the vulnerability of American cities."

Seeking further data on the effect of the atomic bomb, principally, but not entirely, upon naval vessels at sea, a series of tests, under the direction of the Joint Chiefs of Staff, were authorized to be held at the Bikini Atoll in the Marshall Group in the Pacific. For the purpose there was organized Joint Army-Navy Task Force One to conduct what was known as "Operations Crossroads." Three tests were scheduled: first an explosion above the water, second, a surface or subsurface explosion, and then, sometime in 1947, a deep under-water explosion. The first two were held, but the third was postponed indefinitely.

Vice Admiral W. H. P. Blandy, U.S. Navy, was appointed commander of the Joint Task Force, but to assist him and to watch out particularly for the Army ground and air phases, a number of Army officers were appointed on his staff. Major General Leslie R. Groves, U.S. Army, commanding General of the Manhattan District, was selected as a liaison officer. See BIKINI TESTS.

The Army Ground Forces were given opportunity to test equipment, both on the target ships and ashore. On the Atoll the Army placed guns and other combatant equipment and constructed various types of dugouts.

Equipment, fuel, and supplies were put aboard 19 of the target vessels and more than 100 different items of ordnance materiel were arranged within the target area. Exposed to the bomb's effect were samples of clothing, fruits, vegetables and cereals, both processed and fresh. The Army Quartermaster Corps placed out standard test lots of Army rations, some stored in protected positions and others exposed. A variety of textiles were included to give data on clothing that will withstand the flash and blast.

The first test was held July 1 and the second on July 25. From the data collected through instruments and observation and the analysis of materials within the blast area, the dugouts, the weapons, etc., study is still underway to help guide the Army in its future development program and procedures it must follow if atomic warfare is not effectively ruled out.

Official reports on the Army's observations have not been made public but unofficially it is said that the tests demonstrated that soldiers in dugouts or tanks would survive such a blast from as close as 500 yards and be able to continue fighting. Artillery and heavy equipment, and ammunition when stored in containers, will remain useable. Lighter and more delicate equipment, however, it was reported, such as amphibious trucks, jeeps, searchlights, and radio equipment, was heavily damaged at distances as great as 1,200 to 1,500 yards. Much of the exposed textiles, clothing, blankets, etc., caught fire and burned from the flash effect up to great distances. Much of the packaged foods showed no effect of radiation, although soap and powders appeared to retain radioactivity longer than other materials.

Subsequently, General Jacob L. Devers, U.S. Army, Commanding General Army Ground Forces, expressed a belief that the atomic bomb would not prevent such Army operations as amphibious landings. He added:

"We will have to go after the sources of atomic bombs and destroy them and from there on you will have the same thing as before—the need for ships, planes, and the doughboy. He is still the one who can occupy the enemy's territory and hold it."

**Guided Missiles.** By a directive issued October 7, the Secretary of War assigned to the Commanding General of the Army Air Forces, the responsibility for the research and development activities pertaining to guided missiles, including corresponding counter measures, as well as related and associated items of equipment.

This settled in favor of the air forces long standing differences between the various technical services, such as Ordnance, as to the dividing line between their responsibility and that of the Air Force. There had been a general ruling that all guided missiles equipped with wings were air force projects and others belonged to the ground technical services. However, the October ruling appeared to give over-all authority to the Air component.

Throughout the year, U.S. Army forces carried on tests with German long range rockets. Large numbers of German scientists who worked on the various projects were employed by U.S. Army ground and air forces to aid in the further development of these new types of weapons.

**Unification of U.S. Defenses.** Unification of the Armed Forces into a single Department of Common Defense, so ardently urged by President Truman and the War Department, but so strongly opposed by the Navy's adherents, was recommended by the Senate Committee on Military Affairs, but

was not brought to a vote on the floor before adjournment of the 79th Congress. Nevertheless, the President and the plan's supporters in Congress announced their intention of bringing it before the 80th Congress. Its ultimate success, they believed, would be brought nearer by enactment of the plan for the reorganization of Congress, a section of which provides for the consolidation within each house of Congress of its Committees on Military and Naval Affairs into a single Committee on Armed Services. The Reorganization Act adopted by the 79th Congress provides that the Committee on Armed Services in each house will be responsible for:

"... all proposed legislation, messages, petitions, memorials, and other matters relating to the following subjects:

- "(1) Common defense generally.
- "(2) The War Department and the Military Establishment generally.
- "(3) The Navy Department and Naval Establishment generally.
- "(4) Soldiers' and sailors' homes
- "(5) Pay, promotion, retirement, and other benefits and privileges of members of the armed forces.
- "(6) Selective service
- "(7) Size and composition of the Army and Navy.
- "(8) Ports, arsenals, military reservations, and navy yards.
- "(9) Ammunition depots.
- "(10) Conservation, development, and use of naval petroleum and oil-shale reserves"

**Unify Field Commands.** Since the end of hostilities and during the discussion of the proposal to unify the armed forces in a single department, the services actually drifted away from the system of unified commands in the field which the war had forced upon them. So far had this trend gone that the charge was frequently made that the defense of Hawaii was again under the same type of divided command which investigators said contributed to the success of the Pearl Harbor attack.

Consequently, near the end of the year the Joint Chiefs of Staff drew up, and President Truman approved, a system of unified military commands "designed to place responsibility for the conduct of military operations of the land, naval, and air forces in the several regions of military importance to the United States, in the hands of one single commander."

The commands designated at that time (December 17) were:

- (1) Far East Command—Commanded by General of the Army Douglas MacArthur, U.S. Army.
- (2) Pacific Command—Commanded by Admiral John H. Towers, U.S. Navy.
- (3) Alaskan Command—Commanded by Major General H. A. Craig, U.S. Army.
- (4) Northeast Command—Commander not named.
- (5) Atlantic Fleet—Commanded by Admiral Marc A. Mitscher, U.S. Navy.
- (6) Caribbean Command—No change for the time being.
- (7) European Command—Commanded by General Joseph T. McNarney, U.S. Army.

Also established was a Strategic Air Command comprised of strategic air forces not otherwise assigned. These forces will normally be based in the United States and their commander will be directly responsible to the Joint Chiefs of Staff.

**British Unified Defense.** The new Labor Government in Great Britain, in a White Paper presented to Parliament by the Prime Minister in October, proposed the establishment of a "Central Organization for Defense." Under this plan the three services—army, navy, and air force,—would be retained as separate services under their separate Ministries, but there would be created a new Minister of Defense "who would be responsible for correlating them.

The White Paper rejected both complete amalgamation and the creation of a Combined General Staff. Of complete amalgamation under a single Minister of the Crown, the White Paper said: "His Majesty's Government does not wholly reject this conception: it may be that at some stage in the future amalgamation might be found desirable. They have decided, however, that this is a step which could not and should not be taken here and now." On the "Combined General Staff" idea the White Paper commented: "Critics of our organization have contended that the Chiefs of Staff Committee, and the Joint Staffs for planning, intelligence, and administrative planning, do not form a combined General Staff in the sense of an impartial central organization which plans operations without regard for Service prejudice or sectional interests. Our own experience, however, and a close study of captured German archives showing the working of the *German Oberkommando der Wehrmacht* (O.K.W.), combine to demonstrate that this conception is not only inferior to our Joint Staff system, but has defects which in practice proved disastrous. The German system failed because the Planning Staffs of the O.K.W. were not drawn from the headquarters of the three Services. The plans they produced had later to be handed to those headquarters for execution, and were often found to be unrealistic. The cleavage between planning and execution set up dangerous antagonisms, and entirely nullified any theoretical advantages of the German system."

The form of the proposed organization was summarized as follows:

"(a) The Prime Minister will retain the supreme responsibility for defense.

"(b) The Defense Committee, under the Chairmanship of the Prime Minister, will take over the functions of the old Committee of Imperial Defense, and will be responsible to the Cabinet both for the review of current strategy and for coordinating departmental action in preparation for war.

"(c) A new post of Minister of Defense, with a Ministry, will be created. The Minister of Defense will be responsible to Parliament for certain subjects... affecting the three Services and their supply. In addition, he will be Deputy Chairman of the Defense Committee, and he will also preside over meetings with the Chiefs of Staff whenever he or they may so desire.

"(d) The Chiefs of Staff Committee will remain responsible for preparing strategic appreciations and military plans, and for submitting them to the Defense Committee, and the Joint Staff system will be retained and developed under their direction.

"(e) The Service Ministers will continue to be responsible to Parliament for the administration of their Services in accordance with the general policy approved by the Cabinet and within the resources allotted to them."

The White Paper outlined the functions of the Minister of Defense as follows:

"Apart from his duties as Deputy Chairman of the Defense Committee, it is proposed that the Minister of Defense should, as such, be responsible for the following functions:

"(a) The apportionment, in broad outline, of available resources between the three Services in accordance with the strategic policy laid down by the Defense Committee. This will include the framing of general policy to govern research and development, and the correlation of production programs.

"(b) The settlement of questions of general administration on which a common policy for the three Services is desirable.

"(c) The administration of inter-Service organizations, such as Combined Operations Headquarters and Joint Intelligence Bureau.

"The minister will bring his proposals under (a) before the Defense Committee and the Cabinet. He will present the Cabinet's decisions on these to Parliament, and will decide questions arising between the three Services in their application. He will not be responsible for the subsequent detailed execution of the approved programs, which will be the task of the Service and Supply Ministers. As a consequence of (b), he will answer questions in Parliament on matters common to the three Services or to the three Services and the Ministry of Supply."

**Departmental Organization.** Effective July 11, the United States War Department was reorganized so as to make the War Department General Staff the dominant agency not only in the formation of plans but also in the direction, coordination, and supervision of virtually all operations of the Army. The Army Ground Forces and the Army Air Forces were retained, but the Army Service Forces' organization was abolished and its functions redistributed. The nine "Service Commands," were dropped and six "Army Areas" were set up. The autonomy of the Army Air Forces was strengthened and its representation on the new and more powerful General Staff was increased.

In connection with the reorganization it was made known that the Department will propose legislation to abolish the Chiefs of Infantry, Cavalry, Field Artillery, and Coast Artillery, positions which have not been filled since the Army Ground Forces were established early in the War. It was also announced that the Field and Coast Artilleries will be merged into a single Artillery arm such as existed before their separation in 1907 and that the Cavalry and the Armored Force will be combined into a single arm to be known as Armored Cavalry.

The 1946 reorganization, with such modifications as experience dictates, is to be the basis for permanent legislation for the postwar Army. The reorganization is, of necessity, temporary since it was accomplished under authority of the War Powers legislation.

The crux of the new organization lies in the greater powers and authority given to the War Department General Staff beyond the purely planning functions envisioned in the National Defense Act, Section 5 of which provides that:

"members of the General Staff . . . shall not be permitted to assume or engage in work of an administrative nature

that pertains to established bureaus or offices of the War Department, or that, being assumed or engaged in by members of the General Staff Corps, would involve impairment of the responsibility or initiative of such bureaus or offices, or would cause injurious or unnecessary duplication of or delay in the work thereof."

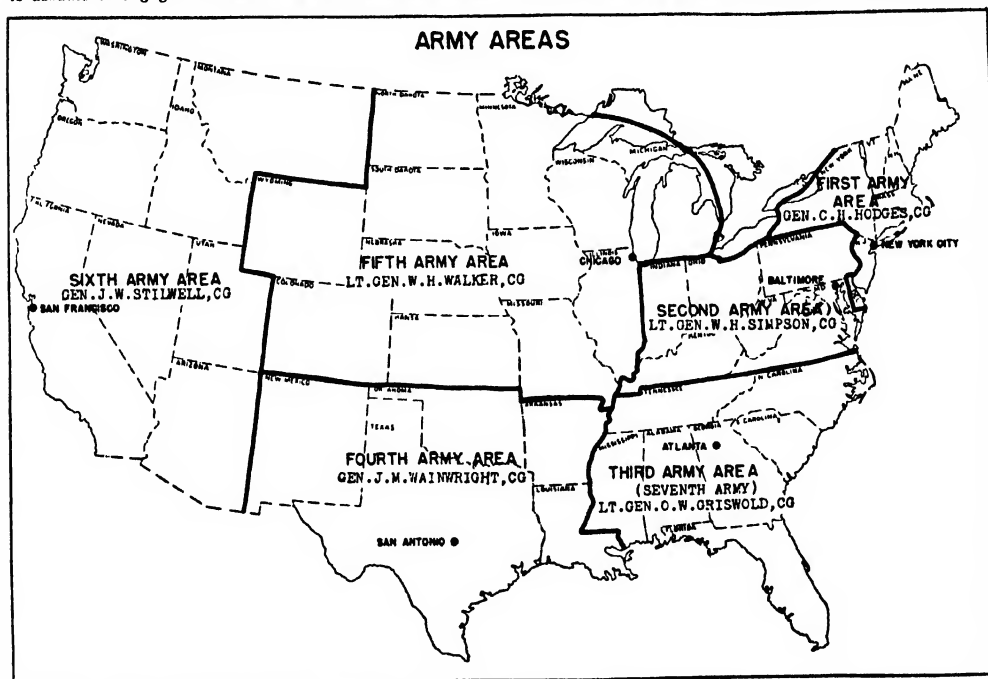

The 1946 reorganization gives the Staff the following broad powers (from War Department Circular 138):

"The War Department General Staff, under the direction of the Chief of Staff, will be responsible for the development of the Army and will insure the existence of a well-balanced and efficient military team. It is specifically charged with the duty of providing such broad basic policies and plans as will enable the Commanding Generals of the Army Ground Forces, the Army Air Forces, task forces, theaters of operations, overseas commands, and such other commands as may be established, and the heads of the administrative and technical services, to prepare and execute detailed programs. In addition, the General Staff assists the Chief of Staff by issuing in the name of the Secretary of War and the Chief of Staff, necessary directives to implement such plans and policies and supervises the execution of these directives. In performing its duties the General Staff follows the principle of decentralization to the fullest degree. No function will be performed at the general or special staff level of the War Department which can be decentralized to the major commands, the army areas, or the administrative and technical services without loss of adequate control of operations by the General and Special Staffs. The War Department General Staff will include six divisions, each under the immediate control of a director. Each director will plan, direct, and supervise the execution of operations within the confines of his sphere of action. In carrying out their duties, the directors of the six General Staff Divisions will be guided by the following general principles

"(a) They will plan, direct, coordinate, and supervise. They will assist the Chief of Staff in getting things done, in addition to coordinating, planning, and policy-making on an Army-wide level.

"(b) They will, by means of direct contact with troops, determine that orders, instructions, and directions are being carried out as the Chief of Staff intended

"(c) They will follow the principle of decentralization to the fullest degree. The War Department General Staff will concern itself primarily only with matters which must be considered on a War Department or Army-wide level. All other matters will be decentralized down to the proper

The areas assigned to the six field Armies as provided in the reorganization of July 11, 1946, show the commanding generals assigned as of that date. (The Seventh Army was temporarily assigned to the Third Army Area, the Third Army being on occupation duty in Germany.)

echelons of command for action or decision. In order for this to be done properly, adequate authority will be delegated to responsible commanders and the heads of the administrative and technical services. Each director will take necessary action to indoctrinate each officer of his division with a thorough understanding of the duties, functions, responsibility, and authority of the various echelons of command in the Army.

"(d) They must act to minimize duplication. While observing the principle of decentralization, all general staff directors will take appropriate action to minimize duplication and overlapping between the commands and services. This subject becomes of increasing importance as procedures are approved providing for greater autonomy for the Army Air Forces within the War Department structure. "The aim will be to provide the Army Air Forces with the maximum degree of autonomy permitted by law without permitting the creation of unwarranted duplication in the functions of service, supply, and administration. The only workable procedure for removing and preventing duplications lies in the good faith and friendly collaboration of using commands and services, under the mentorship of the appropriate general staff director."

Brig. Gen. Williston B. Palmer, U.S. Army, commandant of the Army Information School, in a lecture on the new organization, said:

"The reorganization of 1946 confirms and consolidates the victory in a long struggle toward an Army High Command capable of conducting war. For today, after 150 years of groping, the professional head of the Army is the Chief of Staff chosen from the line of the Army; and under him the General Staff, chosen from the whole of the Army, has the power to plan, direct, coordinate, and supervise the operation of the Army.

"The line of the Army, after a century and a half, has taken control of the Army away from a collection of independent cliques in the War Department, which in the old days were self-perpetuating, had many favors which the line had not, denied the right of the professional head of the Army to coordinate their military effort, and took professional and technical questions over his head to the Secretary of War.

"The civilian head of the War Department still directs the Chief of Staff in the sense that the President desires, but the details of Army administration and operation are in the hands of the professional Chief of Staff, and if the Chief of Staff does not perform his duties to the satisfaction of the President and the Secretary of War, the remedy is simple: appoint a new Chief of Staff who will satisfy the President and the Secretary of War. The organization of the High Command of the Army now makes sense, for the first time in our history."

Under the reorganization the Assistant Chiefs of Staff were made "Directors" as follows: Director of Personnel and Administration, Director of Intelligence, Director of Plans and Operations, Director of Organization and Training, Director of Service Supply and Procurement, and Director of Research and Development.

**Army Air Forces Organization.** In March General Carl Spaatz, U.S. Army, Commanding General Army Air Forces, announced organizational changes providing for three major combat commands and five supporting commands operating under Headquarters, Army Air Forces. Simplicity of structure was sought by having not more than eight individuals reporting directly to the Commanding General AAF.

The three combat commands established were:

- (1) The Strategic Air Command, embodying the combat groups of the long range fighting forces
- (2) The Air Defense Command, to be responsible for the air defense of the continental United States and for the coordination of the continental air units, including the Air National Guard and Air Reserve, into effective fighting forces
- (3) The Tactical Air Command, charged with cooperative missions with the surface forces.

Immediately under these commands come the numbered Air Forces.

In addition to the three combat commands there was established:

- (1) The Air Materiel Command, to perform normal maintenance and supply functions as well as research and development,
- (2) The Training Command, to provide all phases of individual training except the higher education carried on

in the Air University and the unit training conducted in the three combat commands.

(8) The Air Transport Command, to provide the global systems, including military air transport, air signal communications, flight service, weather, rescue, flying safety, and aeronautical chart service.

(4) and (5) The Air University and Air Force Proving Ground Command, two agencies whose functions are to crystallize and to disseminate the latest Air Force doctrine through training programs and through tactical experimentation.

In explaining the organization, General Spaatz said:

"The Commanding General of the Army Air Forces ordinarily will exercise only administrative, training, and tactical supervision over the air units assigned to a theater. Under certain conditions of employment of units of the Strategic Air Command, however, his function may be extended to the exercise of complete command control, as was the case originally with the 20th Air Force."

**Divisional Organization.** The first large scale revision of the combat division organization to follow World War II was approved by General of the Army Dwight D. Eisenhower, Chief of Staff, U.S. Army, near the close of the year.

These changes in the Infantry and Armored Divisions were based on recommendations submitted by former division and unit commanders, the General Board of the European Theater of Operations which sat at Bad Nauheim in 1945-46, and the Infantry, Armored, and Artillery Conferences held at service schools in the spring of 1946. Combat lessons learned in all theaters of action during the war were incorporated in the new organizations.

**Infantry Division.** The newly approved war strength American infantry division numbers between 17,000 and 18,000 officers and enlisted men, an increase of more than 3,000 over its World War II strength.

The most important changes include:

- (1) Inclusion of an organic tank battalion.
- (2) Inclusion of an organic antiaircraft artillery battalion
- (3) Addition of two more howitzers to each of the 12 firing batteries of the division artillery, increasing its firepower 50 percent
- (4) Reduction of the Infantry squad from 12 to 9 men.
- (5) Addition of a fourth company and a bridge platoon to the engineer battalion

Included in the plans for each regiment is a headquarters company, a service company, and three battalions consisting of a headquarters company, heavy weapons company and three rifle companies each; a tank company (in addition to the headquarters and three combat companies of the organic battalion under division control); a heavy mortar company armed with the 4.2 mortar, and a medical company.

Eliminated as a result of this new alignment will be the anti-tank and cannon companies, and the collecting company which was a part of the divisional medical battalion.

During World War II, especially in the Mediterranean and European theaters, each division generally had separate battalions of tanks and anti-aircraft artillery detailed to provide it with their types of specialized support. Tactically, this arrangement proved sound, but administratively it led to difficulties. By including these battalions organically in the division, it is believed that greater efficiency may be achieved.

The inclusion, however, of a company of tanks in each regiment as well as a battalion in the division means that the number of tanks working with the division as a whole will be doubled. In World War II each division usually had three tank companies working with it, but the division of the

future will have six, armed with the big M-26 "General Pershing" tank mounting a 90-mm. gun.

Division artillery will still consist of three battalions of 105-mm. howitzers and one battalion of 155-mm. howitzers, but the number of pieces in each firing battery will be increased from four to six. Combat experience indicated that a battery could handle six guns without materially increasing its command and administrative overhead. This increase will give the division fifty-four 105-howitzers and eighteen 155-howitzers. During World War II all artillery in the infantry division was towed; it is still towed, but it is contemplated that towed guns will be replaced with self-propelled guns as soon as suitable models are developed.

A reduction in the size of the infantry squad from twelve to nine men was made because combat experience indicated that a squad leader could not control more than eight other men in battle. The future squad will have, besides its leader, an assistant squad leader, five riflemen, a Browning Automatic Rifleman and the latter's assistant.

A fourth company has been added to the engineer battalion to give the division a spare. One company is usually detailed to work with each regimental combat team, to afford close, front-line support. When the battalion had only three companies, the division frequently was left without any engineers to handle other than front-line jobs. The added bridge platoon will have certain types of bridging material heretofore issued only to corps and army engineer units.

The new divisional medical battalion has been greatly reduced in size and scope. During World War II it had, besides its headquarters company, three collecting companies and one clearing company. The litter sections have been removed from the collecting companies and given to the regiments to achieve better control and services. The ambulance platoons of the old medical battalion's collecting companies have been combined to form an ambulance company.

Three changes have been made in the division special troops. The old headquarters for special troops has been abolished. The recent creation of a military police company in certain divisions has been standardized. A replacement company, supervised by seven officers and thirty-one enlisted men, has been added, this company's job will be to receive the division's replacements and prepare them for their battle assignments.

Several important types of equipment have been increased in the division, or added to it. During World War II, all the liaison planes were in division artillery, but an experimental increase from ten to sixteen planes is standard in the new setup. The additional "grasshoppers" will be assigned one to each regiment and three to division headquarters.

Radar equipment, which had been supplied to an interim-type division, had been made organic to the headquarters of division artillery and each regiment, to facilitate the location of enemy artillery and mortars. Forty-two 75-mm. and eighty-nine 57-mm. recoilless rifles will be included in the division's armament.

**Armored Division.** The newly approved U.S. armored division consists of approximately 15,000 officers and men, and incorporates an important change in its command organization. Modifications will be made to fit peacetime restrictions of personnel and materiel. During World War II, the combat elements of the division were grouped under Combat Commands "A" and "B," and a small fraction held for contingencies under Combat Com-

mand "R," or Reserve. The new setup will substitute a Combat Command "C" headquarters for the old reserve headquarters, creating three command headquarters of equal capabilities.

During the war the United States had sixteen armored divisions, all of which saw action in either the Mediterranean or European theaters, and many in both. Thirteen of these had an authorized strength of 10,000, but the 2nd and 3rd Armored Divisions were activated under a table of organization which authorized 14,000. The 1st Armored Division fought in Africa and part of the way through Italy with an authorized strength of 14,000, before reorganizing on the same basis as the majority of the divisions.

Regardless of the type of organization, combat experience indicated that the ratio of infantry to tanks was insufficient. To remedy this shortcoming, an entire battalion of infantry will be added to the division, and the strength of each existing infantry battalion will be increased from three to four rifle companies, increasing the number of rifle companies from nine to sixteen.

As with the infantry division, the armored division infantry squad will be reduced in size, but in this case to ten men. The tenth man will drive the squad's full-tracked personnel carrier.

An added heavy tank battalion will be equipped with the M-26 "General Pershing" tank. Like the division's three medium tank battalions, it will consist of three tank companies of four platoons each, making the tank battalions of the armored division identical with the tank battalions of the infantry division.

The M-26 has recently been classified as a medium tank, but will be issued to the heavy battalions until a new heavy tank is brought out.

Artillery and anti-aircraft battalions are also added to the armored division, under control of division artillery headquarters. The additional artillery 155-mm. howitzers, and each of the other three battalions will have 18 self-propelled 105-mm. howitzers. The anti-aircraft battalion will have 64 self-propelled weapons, half of them quadruple .50 caliber machine guns and the other half dual 40-mm. guns.

Other additions to the division include a bridge company and an additional line company for the engineer battalion, and a supply battalion of two truck companies. A major deletion will be the tank destroyer battalion which was usually detailed to work with the division in combat; its work will be taken over by the extra tank battalion with its 90-mm. guns.

The division special troops will include signal, military police, replacement and headquarters and service companies. The division trains will consist of a headquarters company, an ordnance maintenance battalion of a headquarters and three maintenance companies, and a medical battalion of a headquarters and three medical companies. The supply battalion will be included in the division trains.

An important change in equipment will be the addition of 530 full-track personnel carriers to transport the infantry. During the war, the armored infantry rode to battle in half-tracks.

The division will lose 28 light tanks, but will gain 130 medium tanks, for a total strength in mediums of 325.

**Field Maneuvers.** The importance being placed on the Arctic regions by the military leaders was emphasized in the decision of the United States high command to conduct three of its field training maneuvers as cold weather projects. Three

"task forces" were designated to test all types of Army Ground Force equipment, including tanks, self-propelled guns, radars, special snow vehicles, new rations, kitchens, clothing, and other items under Arctic conditions.

To determine whether existing equipment will function and what new equipment is required for ground forces to fight under all winter conditions, certain items of equipment used in winter combat in the European Theater of World War II having proved unsatisfactory, task forces "Frigid," "Frost," and "Willwaw," were set up for exercises in Fairbanks, Alaska, Camp McCoy, Wisconsin, and Adak, Alaska, respectively.

After preliminary training, these task forces started their field work about October 1, 1946, and are scheduled to operate until about April 30, 1947, to ascertain the suitability of present equipment and new types of equipment to meet all possible winter combat conditions. At the same time they are studying the need for changes in existing tactical doctrines and training methods for winter operations.

General of the Army Dwight D. Eisenhower, U.S. Army, Chief of Staff, discussing the Arctic area at a press conference in October, however, gave as his opinion that its importance lies principally in the strategic airplane routes over the polar area rather than as a battlefield. General Eisenhower said:

"People have discovered that with the increasing range of the big airplane the shortest distance around the earth to countries that are lying in the Northern Hemisphere is right over the Arctic. So that is the reason they show so much interest in the Arctic region. And another thing, all weather starts in the Arctic. They want to get more meteorological data and so improve our weather services. With the facilities man now has there is a limit to the temperature under which we can operate. In the Bulge (Battle of Ardennes) the temperatures reached zero, and our struggle to get men out of the cold was a terrific thing because we found that very quickly wounds would be fatal because of low temperature. If you have fighting temperatures even of 40 degrees you must have highly trained troops. I wouldn't look, in other words, for the wastes of the Arctic to be the battlefields as you knew battlefields in France and Germany."

The fourth large exercise of the 1946 training season was an amphibious one using the 162 separate combat amphibious operations in World War II as a guide. It was a joint Army-Navy maneuver held in the San Diego-San Clements Island-Oceanside area of Southern California.

Initial preparation for the operations included indoctrination school at Fort Ord and Coronado, California, from July 29 to September 30. During October intensive basic training in amphibious operations was given at Fort Lewis, Washington, the Second Infantry Division being assisted by the Navy Troop Training Unit. Beginning November 1 units of the Second Division and supporting troops were combat-loaded in the Tacoma-Olympic area in ships of the Amphibious Force, U.S. Pacific Fleet, and at the conclusion of the exercise were returned to Fort Lewis. Aircraft from carriers of the Pacific Fleet supported the amphibious operation and battleships, cruisers, and destroyers delivered gunfire support.

Headquarters 12th Air Force, March Field, California, worked with units of the Sixth Army in the planning and conduct of the tactical air support of the assault troops. The amphibious exercises ran from September 1 to December 1.

**Education.** The school system by which the officer and enlisted personnel of the Army of the United States are to be kept professionally fit and abreast of modern warfare was in process of development throughout the year. Basis for the new school sys-

tem is the report of the War Department Military Education Board appointed by the Secretary of War in November 1945. The report, and recommendations were submitted in February 1946.

For officer training the new system set up schools at five general levels "to provide broad military education and practical training for officers." Three of these school levels are strictly War Department institutions:

(1) Air and Ground basic schools, (2) Air and Ground advanced tactical and technical schools, and (3) the Command and Staff College and the Air College.

The two higher levels fall under the jurisdiction of the Joint Chiefs of Staff inasmuch as officers from all the Armed Services attend them. They are:

(1) the Armed Forces Staff College and (2) the National War College and the Industrial College of the Armed Forces.

In this system provision has been made for the inclusion of officers of the National Guard and the Reserve through short-term "associate" courses, extension courses, and the regular or full-term courses.

In addition to this strictly military education officers will be selected to pursue special technical courses at civilian colleges and universities. Others will attend foreign schools, while still others will be trained in industrial and manufacturing concerns. There will, too, be an interchange of students with schools operated by the Navy.

The three higher schools under the Joint Chiefs of Staff are designed to bring about that coordination and mutual understanding which the war showed to be so necessary. The Armed Forces Staff College, located at Norfolk, Virginia, trains officers in the coordination of the various services for joint operations, including staff techniques and the responsibilities, strategical, tactical and logistical, of commanders in joint operations.

The National War College, located in Washington, D.C., includes personnel from the Department of State as well as the Armed Forces in its staff and faculty and student body. It provides instruction to insure the nationally efficient development, organization, and employment of armed forces and the utilization of the Nation's resources to support those forces in the furtherance of national policy.

The Industrial College of the Armed Forces, also located in Washington, D.C., prepares officers for duty with those activities which are concerned with industrial mobilization and procurement planning, evaluates economic war potentialities and studies and analyzes current plans for industrial mobilization.

In November, under the pressure of the necessity for economy and to further streamline the organization, the Army Ground Forces reorganized its school setup, consolidating many of its schools and eliminating others. Four general Centers were established as follows:

- I. The Armored Center at Ft. Knox, Ky.
- II. The Artillery Center at Ft. Sill, Okla.
- III. The Infantry Center at Ft. Benning, Ga.
- IV. The Ground General School Center, at Ft. Riley, Kans.

Effective November 1 the following were eliminated, most of their functions having been absorbed in the new Centers: The Airborne School, the Air Training School, the Cavalry School, the Intelligence School, the Coast Artillery School, and the Anti-aircraft Artillery School. The Mountain and Winter Warfare School was scheduled to be eliminated June 1, 1947.

The former Command and General Staff School became, in May 1946, the Command and Staff College, with the assigned mission of producing qualified commanders and staff officers of the Ground Forces at division and higher levels. It consists of four schools analogous to the general divisions of the General Staff—School of Personnel, School of Intelligence, School of Combined Arms, and School of Logistics.

The new Air University of the Army Air Forces opened at Maxwell Field, Alabama, in September. The top echelon of the new institution is the Air War College designed to prepare senior officers for command and staff duty of higher Air Force units. Here they will study organization, characteristics, and strategical and tactical employment of the Air Forces and larger units, the selection of target systems, targets and aiming points, strategic considerations concerning defense against air attack with particular emphasis upon possibilities inherent in new developments, and the effects of the application of atomic energy in aerial warfare.

The Air Command and Staff School is designed to train officers to command Groups and Wings and for comparable senior staff positions.

The Air Special Staff School, at Craig and Gunter Field, Alabama, prepares officers for administrative and technical assignments on the staff of groups and higher units.

The AAF Institute of Technology at Wright Field, Ohio, trains officers in the technical development of equipment and efficient operation of procurement, supply, maintenance and engineering.

The AAF School of Aviation Medicine at Randolph Field, Texas, conducts courses for aviation medical examiners, aviation nurses, air evacuation, and basic and advanced courses for Air Force medical officers.

The Air Tactical School, scheduled to open in the Spring of 1947, at Tyndall Field, Florida, will prepare younger officers for command of squadrons and for staff duty comparable to the squadron grades.

**National Guard.** In accordance with general policies decided upon by the War Department in the fall of 1945, actual enrollment of officers and enlisted personnel in the National Guard of the United States began in the Summer of 1946.

Instead of the 18 divisions which comprised the prewar National Guard establishment the authorization provides for 25 Infantry Divisions, two Armored Divisions, and separate anti-aircraft artillery, Armored Cavalry, Engineers, Field Artillery, Medical, Ordnance, Quartermaster, Tank, and Signal troops, to make a total of 620,000 Ground Force strength in the National Guard. In addition there is provided a total of 58,000 Air troops, and 4,000 men for Headquarters and Headquarters Detachments for administrative personnel in the offices of the Adjutants General of the States.

Of the total authorized strength of 682,000, however, it is not anticipated that more than 514,000 will be enrolled within the period of the first two years.

**Organized Reserves.** A greatly reorganized Army Reserve also was getting under way during the year. Unlike the prewar model the new Organized Reserve includes both officer and enlisted personnel and legislative authority will be sought so that they may be trained in "Armory Drills" and 15-day summer field exercises similar to the National Guard. A strength of about 24 ground force divisions is planned, plus air force components.

Units in the Active Reserve were being organized as follows:

(1) Class A-1—Service type units at full strength of officers and enlisted men, fully equipped and trained during peacetime. A maximum number of Class A-1 units will be affiliated with civilian industry. Those units for which no sponsor can be found will be organized on a non-affiliated basis.

(2) Class A-2—Combat type units organized at full strength of officers and enlisted men, fully equipped and trained.

A portion of the equipment for these units will have to be retained in storage, since the ORO is not expected to have sufficient armories of adequate facilities to maintain full equipment with each unit.

(3) Class B—Combat and service type units organized with full strength of officers and at least a cadre of enlisted men. Essential individual and training equipment will be provided these units.

(4) Class C—Combat and service type units organized with full strength of officers only.

**Personnel Strengths.** The United States Army, which entered World War II on December 7, 1941 with a personnel strength of 1,686,403 and reached a peak of 8,300,000 at the time of Germany's collapse, had declined to about 1,500,000 at the close of 1946.

Great Britain closed the year with about the same total manpower strength in active service.

The Soviet Army strength has not been officially made public but observers generally credited it with about 3,000,000 men in service.

China's national government, because of internal conditions, maintained a strength of about 2,700,000 in 1946, while the so-called Chinese communists were supposed to be supporting another 1,000,000 men in service.

France, in the process of reconstituting her military strength, maintained an army of 150,000 men.

Yugoslavia reputedly was fortified with an army of 800,000.

Spain, not a participant in the last war, is reported to have an Army of about 300,000.

In South America, Brazil is credited with about 100,000 men under arms, while Argentina was second with 45,000, and Chile third with 40,000 men.

Mexico maintained about 40,000.

All military forces were denied Japan and Germany.

LEROY WHITMAN.

**MINERALS AND METALS.** For the first time since 1938, the total value of mineral production moved downward, according to the annual report of the Bureau of Mines for 1945, the latest date for which returns are available. The recession followed three successive peak years, years in which minerals were mined in the United States in unprecedented quantities to meet the demands of war for essential raw materials. Total value in 1945—\$8,143,000,000—was 3.3 percent below the 1944 peak of \$8,419,000,000 but 47.0 percent above the World War I high value of \$5,540,708,000 recorded in 1918 and 16.6 percent more than the prewar high of \$6,981,340,000 established in 1920. The decline in total value in 1945 was directly attributable to a decrease in the physical volume of production that more than offset a slight increase in the unit sales realizations of mineral producers.

Production in the mineral industries was again retarded by a shortage of manpower. The total labor force, which in 1944 declined 9 percent compared with 1943, shrank 6 percent in 1945 compared with 1944. Decreased demand for some minerals following termination of war contracts and labor disturbances, principally in the coal industry, resulted in a 10-percent reduction in total man-hours worked in 1945; this reduction continued the trend of 1944, when a 1-percent reduction was registered. Other factors adversely affecting

mineral production included the lag in industrial reconversion from wartime to peacetime operations following V-J day; the difficulty and, oftentimes, inability experienced by mining interests in obtaining necessary supplies and equipment required to replace that worn out in the course of expanded production effort during the war period; increasing costs; and, in the instance of some minerals, the depleted state of ore reserves owing to heavy production over the war years without compensating development work to maintain such reserves at prewar level.

Industrial production reached its peak in the latter part of 1943, according to the monthly index of the Federal Reserve Board; the trend since then continued virtually steadily downward through 1944 and 1945. The Board's annual index of mineral production reached its highest level in 1944 and declined 2.1 percent in 1945. Although the consumption of some mineral commodities, particularly the liquid fuels and fertilizer minerals, established new records in 1945, that for many others, including most of the more important metals and coal, dropped appreciably, with the result that total mineral consumption in all probability decreased slightly. Total mineral production likewise declined, the gain made by the fuels as a group and the other nonmetals failing to offset the substantial losses in output suffered by the metals. Both Government and industry stocks were lower at the end of the year, despite increased imports; Government inventories were pared down markedly as the need for war munitions diminished.

Price levels, as reflected by producers' unit realizations, moved upward in 1945; metals and fuels exhibited the more important gains. The increase in producers' price realizations, which was estimated at 2.4 percent over 1944, compared favorably with the 1.7-percent rise in the Bureau of Labor Statistics indexes of wholesale prices for all commodities.

**Value of Mineral Output.** The 3.28-percent decline in the total value of mineral production in 1945 resulted from a 15.60-percent decrease in the value of metallic output. Value of the production of fuels was 0.66 percent higher and that for the other nonmetallics 6.10 percent greater. Although metals represented only 24.3 percent of the total value, whereas fuels represented 64.0 percent and other nonmetallics 11.7 percent, the sharp drop in metallic valuation more than offset the gains made by fuels and the other nonmetallics. Comparative valuation figures in 1944 and 1945, with the 1944 figures in parentheses, were as follows: Total mineral production, \$8,143,000,000 (\$8,419,000,000); metallic, \$1,975,000,000 (\$2,340,000,000); fuels, \$5,212,000,000 (\$5,178,000,000); and other nonmetallic, \$956,000,000 (\$901,000,000). Trends in the production value of these branches of the mineral industries since 1880 are shown in figure 1.

In marked contrast to the situation in 1944 when minerals scored a 4-percent gain in value that compared favorably with advances made in other parts of the economy, the 3.28-percent decline in mineral value in 1945 compared with a 2.89-percent increase in gross farm income, as reported by the United States Department of Agriculture (\$23,893,000,000 in 1944 and \$24,584,000,000 in 1945, including Government payments), and with an 0.80-percent increase in gross national product from \$197,600,000,000 in 1944 to \$199,200,000,000 in 1945. War expenditures comprised 35 percent of gross national product in 1945 and 42 percent in 1944. National income increased 0.19 percent from \$160,700,000,000 to \$161,000,000,-

000 (unrevised), according to the United States Department of Commerce. Compared with 1939 the value of mineral production in 1945 had increased only 66 percent whereas gross farm income increased by 133 percent, gross national product by 123 percent, and national income by 127 percent.

Explanation of the decline in mineral value in 1945, in the face of the aforementioned increases, may be attributed to several factors. Some minerals, notably gold, silver, and certain building materials, were adversely affected by war conditions, and after V-J day the rate of improvement was so slow in the respective industries that for the year their downward trends of 1944 were continued. Manpower shortages and labor disturbances were outstanding deterrents in the attempt to meet existing demand for some minerals, particularly coal and a number of the metals. Difficulty in obtaining mining supplies and new equipment to replace that worn out during the war period also retarded the execution of plans for reconversion to peacetime operation in many mineral industries. Moreover, as will be shown later, the prices of minerals over the war years advanced much less than those for other commodities; in consequence, upward movement of the total value of mineral production has been impeded.

**Consumption.** Over-all consumption of mineral commodities in 1945 reflected the lag in reconversion of industry for peacetime purposes from the wartime efforts of the immediately preceding years. Although about the same number of individual increases and decreases in consumption was recorded in a statistical analysis of 74 of the more important minerals, total mineral consumption was in all probability on a decreased scale as compared with 1944. Consumption of each of the major nonferrous metals—copper, lead, zinc, and tin—and of iron ore declined. Petroleum, natural gas, and natural gasoline consumption increased, but the consumption of anthracite and bituminous coal decreased; collectively, the energy supply from these 5 mineral fuels declined 4 percent. Slow improvement in certain categories of the construction industry resulted in decreased consumption of several of the nonmetallic minerals used for construction purposes.

The Federal Reserve Board index of industrial production declined from 235 in 1944 to 203 in 1945 (1935-39 average=100) after advancing to 239 in 1943 from 89 in 1938 and 109 in 1939. The monthly record shows that the peak war production was attained in October and November 1943, when the adjusted index stood at 247; from January to December 1944 the monthly index declined from 243 to 232 and from January to December 1945 from 234 to 163. The durable manufactures index, which was 78 in 1938 and 109 in 1939, rose to 360 in 1943, declined to 353 in 1944, and fell to 274 in 1945. The production index for transportation equipment, including airplanes, automobiles, ships, railroad cars, and locomotives, advanced from less than 100 early in 1939 to a peak of 786 in November 1943, fell back to 709 in December 1944, and dropped to 217 in December 1945.

Contract terminations, manpower shortages and labor disturbances, difficulties in obtaining necessary equipment and supplies, and other obstacles to expeditious industrial reconversion to peacetime operations were the principal underlying causes of decreased mineral consumption in 1945. Steel production decreased 11 percent, involving a 14-percent reduction in the consumption of iron ore and an 8-percent decrease in the demand for manganese

**MINERAL PRODUCTION BY STATES, 1945**  
(U.S. Bureau of Mines)

State	1944	1945	Rank	Percent of Total for U.S.	Principal Mineral Products
Ala.	\$109,149,000	\$111,158,000	15	1.61	Coal, iron ore, cement, stone
Alaska	6,903,000	10,210,000	37	.15	Coal, gold, platinum metals, stone
Ariz.	115,592,000	98,553,000	16	1.43	Copper, gold, zinc, silver

(\*) Less than 0.01 percent

ore. With a decline of 19 percent in the production of alloy steels, a lower level of consumption was recorded for the major ferro-alloy minerals. The decreased scale of general industrial activity was also reflected in a 13-percent reduction in the consumption of anthracite and a 5-percent decrease for bituminous coal. Lead consumption declined 12 percent, tin, 6 percent; copper, about 10 percent; and zinc, 4 percent. The most precipitous drop in consumption, among the metallic mineral commodities, was that of 67 percent for magnesium; this sharp decrease resulted from a marked falling off in demand for the metal for war purposes. Consumption of bauxite dropped 30 percent, largely because of the reduced rate of production of alumina for the aluminum industry. The more important mineral commodities that achieved new records of consumption in 1945 included petroleum, natural gas, natural gasoline and liquefied petroleum gases, phosphate rock, potash, silver (in the arts and industries), platinum, mercury, titanium, barite, carbon black, and sulfur. On a percentage increase basis, the consumption of mercury was outstanding, demand for the metal increasing

49 percent, principally as the result of its utilization in the manufacture of an improved dry battery which was required in substantial quantities by the armed forces in 1945.

**Employment.** Manpower was scarce at mineral operations; and labor shortages, which had become progressively more acute since 1942, were continued through 1945. However, the continued downtrend in the number of men working daily was reversed soon after midyear and by the end of the year the labor-shortage problem had been eased to some extent. In the forefront of the year the labor supply had continued to shrink as Selective Service requirements for men for the armed forces were enlarged and production requirements for mineral raw materials were maintained at a high rate. The prompt termination of war contracts, the closing of munitions, armament, ship-building and other war-fostered industries, and the release of men from the armed forces shortly after the end of the Pacific war were factors in the uptrend in the number of men working during the latter part of the year. The easing of the labor shortages was greater in some mineral industries than was

indicated by the uptrend in the labor force owing to the declining demand for many mineral raw materials as war contracts were voided and the mineral-consuming industries were converted to peacetime production. Demand for raw materials was reduced further toward the close of 1945 by the wave of strikes that virtually closed several important mineral-consuming industries. Despite these factors fostering an abatement of the labor supply problem, manpower shortages were prevalent in the mineral industries at the end of 1945.

Concomitant with the easing of the labor-supply problem, war controls on manpower were relaxed or abandoned. Selective Service requirements were reduced to a minimum, and the labor priority referrals (established in 1944) and other controls of the War Manpower Commission on the movement of labor were discarded soon after the end of the Pacific war.

**MINES, U.S. Bureau of,** (Department of the Interior). During the first year following the end of World War II, the Bureau of Mines readjusted its activities to a peacetime mineral economy, using many new wartime technologic advancements, exploring for new mineral reserves, developing metallurgical processes, continuing extensive research in coal, petroleum and other commodities, promoting safety in mines, and providing many other services valuable to Government and industry.

In the search for new reserves of scarce materials depleted by the war, seventy-five exploratory projects were conducted and more than two hundred mineral deposits in thirty States and Alaska were examined. High-cost processes and techniques for beneficiating low-grade domestic ore reserves were carefully studied to fit in with a post-war economy. The Bureau developed new types of mining and drilling equipment, processes for producing ductile titanium and zirconium, and new ways of making sponge iron.

Through its geophysical work, the Bureau supplied Army engineers with information needed for constructing the Alcan military highway, explored the continental shelf between Alaska and the United States for petroleum resources, and tested Navy-developed magnetic surveys from an airplane. It also gave advice on fuel-burning equipment, boiler corrosion, adaptation of foreign equipment to American mining methods, and safe storage of subbituminous coal. The Bureau investigated ways to increase the known petroleum reserves through more efficient recovery methods and the use of helium as a tracer.

Under its health and safety programs, the Bureau expanded its accident-prevention work, gave first-aid instructions, and continued the examination of mine equipment. It offered technical assistance for the prevention of explosions, roof-fall accidents, and the elimination of health hazards in mining and allied industries. The Bureau also supplied much economic and statistical information on minerals to industry and the public.

**Mineral Development.** In the search for new reserves of iron and related ores, Bureau engineers investigated iron, tungsten, manganese, nickel, and fluor spar deposits in seventeen states and in Alaska. By diamond drilling, trenching or tunneling, minable iron ore reserves were found in Alabama, Montana, and Washington; and tungsten in Nevada. Magnetic surveys were also conducted in North Carolina, Tennessee, and in Utah. In the latter state an estimated 375,000,000 tons of iron-ore reserves were indicated in Iron County—enough to supply the West Coast steel industries.

New ways to produce high-purity metals and to use those already developed were carefully studied by Bureau metallurgists. Electrolytic manganese from the Bureau's pilot plant at Boulder City, Nevada, was distributed to the steel industry for co-operative investigations which resulted in the production of steels as good as those made with ferromanganese. Bureau-produced high-purity ferroalloy metals were much in demand for experimental work in developing high-temperature alloys, used in gas turbines and jet propulsion engines. Bureau methods of manufacturing electrolytic chromium, electrolytic cobalt, ductile titanium and zirconium, expected to have many commercial uses, were released for the first time to the public.

In searching for reserves of non-ferrous minerals, the Bureau examined twenty-eight zinc and lead deposits, and five copper deposits, in fifteen States and in Alaska. Important lead and zinc reserves were discovered in Colorado, Idaho, Kansas, Oklahoma, Washington, and Wisconsin; and promising copper reserves were found in Arizona, Nevada, and Alaska. Every effort was made to re-establish depleted reserves of well-known regions. Considerable work was also accomplished in increasing gold and silver production.

In the field of nonmetallic minerals, seven deposits of mica, feldspar, asbestos, corundum or sillimanite were examined in five states and in Alaska, and sixty additional deposits were studied in various states. Bureau developments included a process to use perlite, a siliceous lava containing magnetic water, expected to be valuable to the building trades; a process to eliminate subgrade minerals from fluorspar; and a process to separate feldspar from quartz and mica. The Bureau also played a small part in the perfection of the atomic bomb at Oak Ridge, Tennessee.

Very little exploratory work was conducted in the field of light metals during the last year, due to a decline in the demand for aluminum and magnesium. Some work was done on the concentration of low-grade bauxites at the pilot mill at Bauxite, Arkansas, and the production of alumina from domestic sources. Two important reports, describing processes to salvage aluminum and magnesium from waste materials, were made public. To insure the Nation's magnesium supply, considerable progress was made in extracting magnesia from the mineral olivine, found in North Carolina and the Pacific Northwest.

Proving extremely valuable in wartime, geophysical surveys were used in discovering new deposits of critical war minerals, such as copper, zinc, manganese, iron ores and magnetites, lead and fluor spar; in locating added oil reserves; and in exploring the continental shelf bordering the United States and Alaska. Survey results of the Alaskan shelf, an area of about 750,000 square miles, indicated important reserves of oil, gas, and mineral deposits. With a plan for underwater exploratory work prepared by the Bureau, preliminary studies likewise disclosed large oil reserves in the continental shelf along the Gulf of Mexico, the Arctic Coast, and the Western Coast of the United States. Geophysical surveys were also supplied to war emergency projects pertaining to the construction of air fields, buildings and roads in Alaska.

**Research in Coal.** Considerable research was conducted by the Bureau to develop substitutes for dwindling high-grade coal reserves, and to use wartime processes in the production of different types of fuel. Bureau scientists found that subbituminous coal could be used in beneficiating iron ores, producing commercial hydrogen, and manu-

facturing synthetic liquid fuels and various chemicals. Bureau technicians examined new types of machines for use in anthracite mines, light equipment for use in strip mining bituminous coal, and a European coal planer. The Bureau proved that lignite in Washington State could be mined inexpensively by strip-mining methods. Seven exploratory projects resulted in the examination of more than 1,800 feet of drill cores from coal beds, and detailed tests were given to nearly 1,000 feet of coal.

In preparing and storing coal, hitherto unmined Washington strip coal proved marketable by washing, recoverable montan wax was discovered in Arkansas and California lignite, and a four-year Bureau study utilizing 30,000 tons of coal resulted in a process of storing subbituminous coal without danger of spontaneous heating or much loss in heating value. In studying coal combustion, the Bureau developed a procedure for evaluating various protective boiler tube coatings, investigated heat absorption in large central-station boiler furnaces, and tested coal-ash slag. The Bureau intensified its survey of carbonizing properties of American and some foreign coal and examined coals from Colorado and West Virginia for possible use in the manufacture of metallurgical coke.

**Gas- and Dust-Explosion Research.** Continuing its work in a relatively new field to help eliminate industrial explosion accidents, the Bureau investigated the limits of inflammability of various dust and vapors, minimum ignition temperatures and minimum spark energies for ignition, and related subjects.

**Synthetic Liquid Fuels.** The four major demonstration plants and laboratories in the Bureau's program to produce gasoline and oil from coal and oil shale were under construction as the work under the Synthetic Liquid Fuels Act (Public Law 290) went into the third year. Laboratory work was being done at Bruceton, Pennsylvania, Morgantown, West Virginia, and Laramie, Wyoming, with an oil shale demonstration plant rising at Rifle, Colorado. A wartime ammonia plant at Louisiana, Missouri, was being converted into a coal demonstration plant.

**Petroleum and Natural Gas.** Bureau experts studied ways to increase the primary recovery of oil through more efficient use of the natural energy in the deposits, to stimulate the recovery of oil from old fields by improved methods and increased operating efficiency, and to increase the use of marginal oils. The last of a group of engineering projects for the Petroleum Administration for War was completed on two important gas-condensate fields in Texas, and engineering surveys were started on three new fields. A method of increasing recovery and reducing operating costs by flowing small stripper wells instead of pumping them was studied in the Appalachian region. Reports on stimulative methods of oil production in Illinois and Indiana were published. Encouraging results were obtained in extracting oil from the Edna deposit of San Luis Obispo County, California, and crude oils from thirty of the Nation's largest fields were examined for possible jet-propulsion-fuel use. Three pure sulfur compounds, pentanethiol, thiophene, and ethyl sulfide, were prepared and will soon be made available to the petroleum industry through the Bureau of Standards. Research was also intensified in superfractionation, desulfurization, hydrocarbon analysis, and engine testing of fuels.

**Helium.** Helium, a lightweight, noninflammable gas, valuable to war, industry, and medicine, was produced in great quantities during World War II.

With the conclusion of the Pacific war, production figures were released for the first time, disclosing that 434,190,000 cubic feet of helium were produced in the six years prior to June 30, 1946. More than half of the 63,403,345 cubic feet produced in 1946 was stored underground at Cliffside, Texas, as a conservation measure; and that same year a new record was attained in the sale of 4,249,125 cubic feet for industrial, scientific, and medical purposes. The Bureau also demonstrated the value of helium as a tracer gas to chart underground formations.

**Explosives Research.** In studying safer methods of using explosives, the Bureau made over 3,200 tests on new permissible explosives and added 2 new explosives to the permissible list, which now includes one hundred eighty. The Bureau tested the effects of sheathed explosives on toxic gases, the hazards of liquid-oxygen explosives, the ignition of fire-damp by explosives, the use of hydrogen peroxide as an oxidizing agent in explosives, and conducted many special studies in cooperation with the Army and Navy.

**Safety and Health Activities.** In the field of safety and health, the Bureau continued to aid the minerals industry through educational and investigative work. The Bureau trained more than 19,000 people in first-aid and mine-rescue work, bringing the number of people trained in these activities since the establishment of the Bureau in 1910 to 1,625,000. Approximately 2,000 workers and officials were trained in accident-prevention work with special emphasis given to roof-fall accidents, responsible for more than half of the fatal injuries in all mining operations. Bureau statistics show that fewer accidents of this type are occurring in coal mines each year. Experienced Bureau safety workers also participated in dangerous rescue operations at three major disasters, investigated fifty other explosions and mine fires, and seventy miscellaneous accidents. The Bureau likewise approved thirty-one units of electrical equipment designed for safe operation in gassy mines, and tested the explosibility of various dusts, safer methods of underground communications, and ways to prevent further inundation and subsidence in anthracite mines, by using practical pumping facilities and back-filling methods. In the four-and-one-half years that Bureau safety experts have been examining coal mines under the Federal Coal Mine Inspection Act, about 200,000 or 35 percent of the safety recommendations made by inspectors have been put into effect by mine operators. Employing a Bureau field force of 167 persons, 2,719 mines were inspected during the past year, of which 320 were initial inspections and 2,399 were reinspections. Of the Nation's 7,000 regular coal-producing mines, 3,260 have been inspected, representing 99 percent of the coal produced in 1945. As a result of increased safety in mining operations, the frequency rate of fatal and nonfatal injuries dropped from 75.90 in 1941 to an all-time low of 66.77 in 1945. Only three major coal-mine disasters, killing 51 men, occurred from July, 1945, to July, 1946. In the war years, 1942-1945, approximately 2,608,000,000 tons of coal were produced with a fatality rate of 2.04 deaths per million tons of coal. In contrast, 1,919,000,000 tons were produced in 1916-1918 with a fatality rate of 3.91 deaths per million tons of coal produced. Thus, based on the coal-mining fatality rate of the first World War, 4,720 fewer lives were lost in coal mines during World War II. In December, 1945, the Explosives Control Division was liquidated after a four-year period of administering the Federal Explosives Act.

Employing nearly 4,000 volunteer licensing agents, the Bureau inspected more than 40,000 explosives-storage magazines, and issued or reissued about 800,000 licenses in 48 States and Alaska, authorizing more than 300,000 persons or organizations to transact business in explosives. Only 56 licenses were revoked during the war. In the field of health research, the Bureau analyzed more than 16,000 gas and dust samples, tested the underground operation of Diesel mine locomotives, supplied information on respiratory protective devices, investigated the characteristics of several gas-indicating instruments, analyzed problems in mine air-conditioning, and studied unhygienic conditions in coal, metal, and nonmetal mines.

**Economics and Mineral Industries.** Although the end of the war permitted a reduction in the frequency and detail of monthly economic and statistical reports, the Bureau revised certain surveys in anticipation of reconversion demands for information on minerals needed for postwar industries. Much information was also supplied to Congress and various Government agencies. The Bureau compiled and distributed reports on commercially important metal and nonmetallic minerals; prepared and released publications supplying domestic and foreign statistics on petroleum and natural gas; made public detailed information on bituminous coal, anthracite, lignite, other solid fuels and by-products; declassified and published much data on foreign minerals; and disseminated considerable information on mine accidents and employment statistics.

**Public Reports.** As a result of demands from industry, Government, and the public for information on minerals, the Bureau released 541 publications last year. They included 96 printed publications, such as bulletins, technical papers, miners' circulars, data books, and Minerals Yearbook chapters; 197 mimeographed reports of investigations and information circulars; 205 papers and speeches for the technical press; and 43 miscellaneous manuscripts and brief periodic statistical reports for industry. Educational films, produced under Bureau supervision from private-industry funds, were distributed to schools and colleges, engineering and scientific societies, and business and civic groups. The films were exhibited on 92,934 occasions to audiences totaling 7,893,218 persons. Four new sound films were added to the Bureau's library, bringing the total number of reels in circulation to 10,925.

R. R. SAXERS.

**MINT, Bureau of the.** A Bureau of the U.S. Department of the Treasury which directs the coinage of money and supervises the activities of the three Mints (Philadelphia, Denver, and San Francisco), the two Assay Offices (New York and Seattle), the gold Bullion Depository at Fort Knox, Ky., and the silver Bullion Depository at West Point, New York. Director: Mrs. Nellie Tayloe Ross.

**MONACO.** A Mediterranean principality surrounded on its land sides by the French department of Alpes-Maritimes. Area, 370 acres; population (1939), 23,973. Chief towns: Monaco (capital), La Condamine, Monte Carlo. During peacetime the main sources of revenue were the tourist traffic and the gambling concession at Monte Carlo. Budget (1939): 38,892,921 francs (franc averaged \$0.0251 for 1939). A ministry assisted by a Council of State administers the country under the authority of the Prince. Legislative power rests with the Prince and the national council of 12 members elected by universal suffrage for a four-year term. Ruler: Prince Louis II (succeeded June 26, 1922).

**MONGOLIA.** An extensive, vaguely defined territory of about 1,875,000 square miles, bounded on the north by Siberia, on the south by Sin-kiang, on the east by Tarbagatai mountains and on the west by the Altai mountains. Population is about 840,000, of which 50,000 are Chinese, 100,000 Russians, and the remainder Mongolians.

**Events, 1946.** The Mongolian People's Republic formally submitted application late in June for membership in the United Nations. In a telegram from Ulan Bator, capital of the Mongolian Republic, Marshal Choy Bol-san, Prime Minister and Minister of Foreign Affairs, pledged his country's support to the principles of the United Nations as set forth in the Charter. Marshal Choy drew the attention of the Security Council and the General Assembly "to the fact that the people of the Mongolian People's Republic took part in the struggle against the Fascist States on the side of the United Nations, having contributed to the struggle by the material resources it has placed at the disposal of its great neighbor, the Soviet Union."

Consideration of Mongolia's application for United Nations membership was postponed after China recommended that the consideration be suspended until the world learned more of Mongolia's current history. The delegate of the Soviet Union upheld Mongolia's application and stressed her aid to the Allied cause. After the declaration of war on Japan on August 10, 1945, the Russian delegate said, Mongolia put 80,000 troops into the war, lost 2,000 and suffered material losses of \$50,000,000.

On August 7 the texts of two treaties, signed in February, 1945, between the Mongolian People's Republic and the Soviet Union, were made public. One was a mutual assistance pact which linked the military power and defenses and the other was an agreement consolidating the economics, cultures, and educational systems of the two countries. In answer to a United Nations inquiry on the foreign relations of the Republic, the Mongolia report said that close relations, "based on recognition of equal rights" had been established with the Soviet Union and that on February 15, 1946 a protocol was signed between the Republic and China with the object of establishing diplomatic relations.

In September, the five-man Mongolian delegation, headed by Deputy Prime Minister Jumzha Tsedenbal, left the United Nations and returned to Ulan Bator.

**MOTION PICTURES.** The motion picture as the art of the people, around the world, emerged in 1946 in a new position of international importance. It was a status evolved in the crucible of war. It was the fiftieth year of the screen, the twentieth year of the sound and talking picture. For decades the motion picture was in evolution in service of the masses at levels below the threshold of important consideration, except by the common man. Now it has become an urgent concern of governments, a subject of poignant consideration by statesmen.

The motion picture entered 1947 involved in the whole vast complex of social, political, and economic issues of the day. It had arrived at this out of wartime demonstration of its command and penetration of audiences, its utility alike in education, military training and propaganda, along with a new recognition of its direct and indirect functions in commerce.

Every nation had a motion picture policy and program. Also the United Nations was formulating a world wide program of message. The pictures were simultaneously employed for causes of war and for causes of peace.

The onetime catch penny-film of the peep-shows and arcades, growing up with the masses, had become a stuff of empire, taking a place in history with salt, amber, furs, spices, gold, iron and petroleum—and uranium.

This development had come integrally with the strengthened, and now recognized, appeal of the medium to the whole people. This was the while conspicuously demonstrated at the universal polling place, the theater box office. Indicative figures, significant both in the United States as the film's homeland and abroad by reason of the international business involved, are available in the year-end report on the Big Five among American motion picture corporations, all engaged in production, distribution and exhibition, with outlets around the globe.

The accompanying comparisons of net incomes rely on closely estimated figures for 1946, and may be taken as indicative of like ratios for most of the scores of lesser organizations, here and abroad.

Organization	1945	1946
Loews, Inc.	\$12,913,000	\$17,000,000
Paramount	15,425,000	45,000,000
RKO	6,031,000	14,000,000
20th Century-Fox	12,746,000	22,000,000
Warner Brothers	9,901,000	19,000,000
	\$57,016,000	\$117,000,000

The total for the Big Five for 1946 was \$59,984,000 greater than for 1945, an increase of approximately 105.2 percent.

The largest single contribution to the totals was inevitably from the American market and its prospering box office, supported by a vast working population laden with buying power by wartime payrolls. The motion picture box office curve inevitably follows the payroll curve. Entertainment is bought, not out of savings, but loose money jingling in the pocket.

The most intensively developed field of motion picture exploitation was still the United States with about ten million theater seats, and a rapidly expanding use of the films in the loosely named "non-theatrical" field, served increasingly by the sub-standard film, preponderantly 16-mm., spread over the world in remote places.

A survey of the world market for motion pictures completed late in the year, after considerable rehabilitation in war-swept areas, found a total of nearly 76,000 theaters in operation around the world, distributed thus:

United States	16,500	Cuba	375
Soviet Russia	16,000	Rumania	350
Great Britain	5,100	Switzerland	350
France	4,392	North Africa	347
Germany	4,000	Venezuela	329
Sweden	2,442	Colombia	300
Italy	2,000	Portugal	288
India	1,957	China	275
Czechoslovakia	1,893	Eire	274
Spain	1,600	Finland	250
Japan	1,500	Norway	250
Australia	1,400	Greece	250
Brazil	1,400	Philippines	250
Argentina	1,343	Chile	250
Canada	1,286	Peru	210
Mexico	1,119	Bulgaria	185
Belgium	1,103	Netherlands Indies	160
New Zealand	551	Puerto Rico	147
Austria	500	Uruguay	140
Poland	500	Turkey	130
South Africa	465	Egypt	125
Netherlands	450	Siam	100
Yugoslavia	450	Malaya	100
Denmark	430	Indochina	100
Hungary	400	Smaller countries	1,030

There in total was the exhibition machine, the address to the world's audiences. Divergent and

pitted forces of political and economic import were engaged in advances and approaches of sorts. The Union of Soviet Socialist Republics maintained its "iron curtain" at home against most foreign film, especially American film, which might convey intimations of a more luxurious life for the common man in the democracies. Sympathetically, the lands under direct military or ideological influence by the U.S.S.R. pursued the same course in varying degrees of intensity.

Great Britain was the while engaged in a valiant movement to create a great world industry of the motion picture centered in London. The American industry, which had so long enjoyed dominance of the world screen, was active in defense of the *status quo ante*, and engaging in a variety of movements to meet the British drive around the world.

**War Made Opportunity.** For an understanding of the manifestations of 1946-47, it is necessary to retrace the facts for a distance. When in 1914 the blight of the first World War fell on lands overseas the motion picture was just arriving at the beginning of its modern era, the period of the "feature picture," the full length drama. The war shut down the studios of England, France, Italy, Germany, and the U.S.S.R., and left the development of the art and the industry to the United States, where a war-rich populace gave new and extraordinary patronage to the new entertainment. The American motion picture took over the world market, which was marginal to the greatest home market any amusement art had ever experienced. Hollywood, the production capital became the production capital of the world, and through the years that followed exercised its buying power to acquire all the proved or budding talent in the world wherever it appeared, and after assimilating, sold it back to the world.

In the years between, which we now know for a truce, the policy continued. America dominated the screen, probably to the extent of 80 to 90 percent. The principal obstacles which arose were in the totalitarian countries, conspicuously the U.S.S.R., Italy, and Japan, where rising walls of nationalism were set against the American pictures and indigenous picture industries were established as arms of government.

In the long history of empire it had long been said that "trade follows the flag" but it became increasingly apparent that trade was in fact following the films. Commercial interests overseas, and markedly in Great Britain, grew aware that the world-wide distribution of the American motion picture was proving an uncommissioned but effective sales agent for American manufactures.

Great Britain sought a degree of control over American domination of its screens by imposing quotas requiring exhibition of a certain percentage of indigenous pictures. The quotas were however indifferently enforced and variously evaded by the showmen. The British industry waxed and waned, in successive waves.

**Great Britain.** But by 1946 the British film and its challenge to American supremacy of the screen, both in Great Britain and in lands around the world had become the conspicuous new fact of motion picture development. Most decidedly the movement was led and personified by Joseph Arthur Rank, previously known as a flour-milling magnate, and very much the industrialist, on the directorates of nearly two score large and varied commercial enterprises, and the first new figure of such stature and promise to arrive on the motion picture scene in many years.

Mr. Rank went into the cinema incidental to his interest in religious and social causes and the films produced for them. He and his story are but little known. His grandfather ran a little windmill for grinding flour at the village of Nafferton in the East Riding of Yorkshire, thereby founding one of the great fortunes of today's England.

The year of 1946 found Mr. Rank in ownership or control of a preponderance of British studios and talent, dominant too in British exhibition, in equipment production, taking in, too, exhibition and production interests in the United States, with other picture ramifications in the capitols of Europe, Australia, New Zealand, Africa, India, and the Orient.

There had been distribution arrangements with a number of American concerns, but near the end of 1946 there came announcement of a capstone arrangement for America in a realignment of assorted Rank undertakings in the United States in coahction with Universal Pictures Corporation—in which Mr. Rank had already a large interest—from which emerged the flamboyantly announced Universal-International. This was signaled by the presentation of the ambitious picture entitled, for America, *Stairway to Heaven*. It had been previously presented in Britain as *A Matter of Life and Death*. It there enjoyed the extraordinary and unique attention for a motion picture, of a royal command performance, significantly timed.

**United States Counter Moves.** In this same period of international development, Eric Johnston, President of the Motion Picture Association, the American film trade association, went to London looking to the betterment of trade relations there and in Europe.

An awareness of the new order on the cinema scene appeared in the year's activities of the State Department in Washington, with consideration of film relations along with negotiations for loans as for instance to Britain and France. Examinations of and report upon the film situations around the world became a function of American embassies everywhere.

The State Department, and other arms of government, were interested in tentative programs for special pictures to be made for selling the American way abroad.

Consideration of a control over films for export was taken up by the House sub-committee on foreign trade of the Special Committee on Postwar Economic Policy and Planning in Washington in late December. Chairman Eugene Worley, of Texas, gave voice to a repetition of an oft-made charge that our motion pictures tended to portray the United States as "a nation of morons and gangsters," and that our people are mostly engaged in "either crime or frivolity." Representatives of the industry listened gravely and gave soft answers. No regulative action was indicated.

In mid-year the United Nations' film division was put into process of organization under the direction of Jean Benoit-Levy, a leader in the production of documentary films in France, recently resident in the United States. The United Nations' film programs and objectives were yet to be revealed.

**Sub-Standard Theaters.** The extension of the 16-mm. film field into areas of entertainment gained impetus through the year, considerably as a sequel to war experience. The portability, safety, and relative simplicity of the 16-mm. mechanisms made them important as in the presentation of training films, and again for combat recording on land, at sea, and in the air. Then as armies went overseas,

16-mm. prints of entertainment product were supplied to army theaters, clear up to front lines and the capacity of the little pictures to entertain large audiences was effectively demonstrated. Meanwhile itinerant 16-mm shows were serving audiences in the American hinterlands, often drawing the vigorous protests of exhibitors of the standard 35-mm. theater.

The little 16-mm. picture on non-inflammable films, free from fire-law restrictions controlling the big theaters, and for the while at least without special pressures from the projectionists unions, enjoyed many special advantages.

With the revelation of new markets both at home and in foreign lands, all American companies developed interest and most of them by 1946 had 16-mm. arrangements of sorts. Loew's, Inc., powerful major concern, announced a program for 16-mm. entertainment projects for foreign fields, and in areas outside competition with the established standard film outlets. RKO made a 16-mm. exploration of South America and reported arrangements and theater projects, principally in the backlands, in Venezuela, Peru, Chile, Colombia, Cuba, Argentina, and Panama. A circuit of twenty theaters in remote Mindanao had equipment enroute at years' end.

Concurrently the Universal motion picture organization in New York announced a world-wide 16-mm. program and the formation of United World Films to handle it, acquiring the while the large Bell & Howell film library and absorbing the extensive Castle Films concern dealing with the non-theatrical 16-mm. trade.

The most historically notable event of the year was the twentieth anniversary of the coming of sound to the screen of the modern era with the presentation of Warner Brothers' *Don Juan* with John Barrymore, first shown on Broadway, August 6, 1926. This marked the acquisition of electronics by the screen, with the devices of sound recording and amplification from the telephone and radio, remaking the industry.

**Pictures and Players.** Each year's end brings surveys and evaluations of the product and the talent. The predominant and continuing interest within the industry is in the people of the pictures. The annual poll of the 16,500 picture exhibitors of the United States and Canada, by *Motion Picture Herald*, seeking their judgment of the ten best money-makers at the box office, resulted in the following sequence: (1) Bing Crosby, (2) Ingrid Bergman, (3) Van Johnson, (4) Gary Cooper, (5) Bob Hope, (6) Humphrey Bogart, (7) Greer Garson, (8) Margaret O'Brien, (9) Betty Grable, (10) Roy Rogers.

A parallel poll under the same auspices, among the box office showmen of Great Britain, resulted in the following appraisal, including both American and British players: (1) James Mason, (2) Bing Crosby, (3) Margaret Lockwood, (4) Greer Garson, (5) Bette Davis, (6) Stewart Granger, (7) Ingrid Bergman, (8) Alan Ladd, (9) Bob Hope, (10) Van Johnson.

Those are reports based upon the day-to-day ballot of the patrons who pay their admissions to see the pictures and people of their choice.

Laurence Olivier, star and director of *Henry V*, from the Shakespearian play, a *Two Cities*—J. Arthur Rank production made in Britain, was designated by the National Board of Review's two hundred reviewers as having given the year's best performance, at the same time deciding the picture the best of the year.

The vote of 559 motion picture critics of the

press and radio, annually polled by *The Film Daily*, designated as the ten best of the year, the following pictures:

1. *The Lost Weekend*—starring Ray Milland
2. *The Green Years*—Charles Coburn, Tom Drake, Beverly Tyler
3. *Anna and the King of Siam*—Rex Harrison and Irene Dunne
4. *The Bells of St. Mary's*—Bing Crosby—Ingrid Bergman
5. *Spellbound*—Gregory Peck—Ingrid Bergman
6. *Saratoga Trunk*—Gary Cooper—Ingrid Bergman
7. *Henry V*—Laurence Olivier
8. *Notorious*—Cary Grant—Ingrid Bergman
9. *Leave Her to Heaven*—Gene Tierney and Cornel Wilde
10. *Night and Day*—Cary Grant—Alexis Smith

The year included, too, the fiftieth anniversary of the dawn of the motion picture screen in entertainment. The historically accepted date is April 23, 1896, with the showing of Thomas A. Edison pictures with the Vitascope, a projector invented by Thomas Armat of Washington, D.C., at Koster & Bial's Music Hall in Herald Square, New York. This was in sequel to the initial showing of kindred pictures in the Edison peep-show Kinetoscope in Broadway, beginning April 14, 1894, not to be confused with the theater screen. The screen's fiftieth anniversary passed without significant official attention from the industry in the United States but enjoyed more attention abroad.

**Labor.** A three-year-long labor turmoil continued in the production center of Hollywood, with an unending sequence of strikes. The issues were entirely jurisdictional, between two pitted groups of American Federation of Labor organizations, the Conference of Studio Unions, made up of left, radical, and liberal unions and leaderships, and the more conservative International Alliance of Theater and Stage Employees, which continued in peace with the producers. Wage demands of working technicians were variously met and adjusted, but there was no peace in prospect among the jurisdictional strikers.

The issues of jurisdiction were complicated by the continuing strategy of the subdivision of crafts into more and more unions. The process was exemplified in the costuming departments where the splitting reached the point where one newly constituted union was held to be exclusively devoted to the administration of girdles, while another dealt with brassieres.

At the close of 1946 there were forty-eight of these divisional unions involved in debates and controversies of jurisdiction. Production was continuing under difficulties, with picketing in process, spasmodically and at especially opportune occasions at various studios. Neither the national authorities of the AFL nor the employers were able to prevail and no end was in sight for the new year ahead.

**Anti-Trust Case.** After eight and a half years of tedious litigations, the Government's anti-trust suit against the eight principal concerns of the motion picture industry arrived at a decree, filed New Year's eve, finding the defendants guilty of violation of the Sherman Act and defining a program of trade practices to be applied.

This presumably ended the considerations of the court of first instance, but was declared unsatisfactory by both the Department of Justice and the defendants—also all of the collaterally concerned interests and those who had appeared as amici curiae. Appeal was certain and prospects of a final adjudication were exceedingly uncertain.

The suit entitled, *The United States of America versus Paramount Pictures, Inc.*, in equity No. 87-

273, was filed July 20, 1938, when Thurman Arnold was in charge of the anti-trust division of the Department of Justice. There was a long interlude in which the defendants operated under a Consent Decree, which was in effect a tentative and experimental truce. The case went to trial a year and a half before the entry of judgment, December 31.

TERRY RAMSAYE.

**MOTORBOATING.** Power boat racing, which came to a dead stop during the last few years, roared back into the national sports picture in 1946.

Guy Lombardo, the band leader, captured several major events during the season. Making his debut as a big boat driver in the national sweepstakes at Red Bank, New Jersey, Lombardo piloted the Tempo VI to victory in three straight heats and less than a month later won the Gold Cup on the Detroit River. In sweeping all three 30-mile heats in that blue ribbon classic, Lombardo set three records for Gold Cup racing, lifting the 90-mile average to 68.072 miles per hour, the standard for a heat to 70.890 and the mark for one lap to 77.911. It was Tempo's third Gold Cup victory, having been the winning craft in 1939 and 1941 when owned by Zalmon Simmons Jr. and called My Sin.

Tempo, however, placed second to Miss Great Lakes in the President's Cup regatta late in September when the big, yellow boat driven by Dan Foster of Oakland, California, an ex-Army pilot, won all three heats. Sixty thousand spectators lined the banks of the Potomac to see Miss Great Lakes, owned by Albion Fallon of Detroit, break two regatta marks, boosting the heat time to 71.181 m.p.h. and the lap time to 71.565.

THOMAS V. HANEY.

**MOTOR VEHICLES.** Passenger-car production in 1946 totaled an estimated 3,779,682, or 57 percent of the 3,755,309 automobiles which motor-vehicle manufacturers produced in 1941. Major factors preventing attainment of the production goal of cars in 1946 were (1) strikes, (2) parts and material shortages, and (3) government controls.

With the greater portion of the physical reconversion of automotive plants swiftly accomplished within a few months after V-J Day, the industry anticipated that automobile production would reach a monthly rate of 300,000 units in January, 1946. By the following June, the industry hoped to increase the monthly output rate to 500,000—or an annual rate of production of 6,000,000 cars. Actually, however, only 142,000 automobiles were turned out in June.

Although one company had started its assembly lines as early as July, 1945 (under the partial reconversion program approved by the War Production Board after V-E Day), not until August, 1946, did the industry as a whole produce its millionth postwar automobile. Total net loss sustained by passenger-car makers during the first nine months of 1946 amounted to \$5,500,000.

Truck manufacturers were hampered by the same obstacles as the passenger-car makers; however, the fact that civilian models were produced in varying quantities throughout the war, and the consequent comparative ease in reconverting to peacetime output, enabled them better to cope with shortages and production problems. As a result, despite their slow start in the first weeks of the year, truck companies produced an estimated total of 940,000 units in 1946. The previous peacetime peak of 1,060,941 (including 218,657 military) units was reached in 1941.

Throughout this first full peacetime year since 1941, actual production of automobiles lagged behind schedules which had been determined in the fall of 1945.

One company scheduled an output of 711,600 cars and trucks in the first half of the year; it was able to build only 287,258, or 40 percent of anticipated production. Another expected to turn out 654,950 in the same period; actual production totaled 196,971 or 30 percent of the scheduled output. A third company planned a combined six-month production of 115,500 motor vehicles but built only 42,700—or about 36 percent of the scheduled output. Other motor vehicle companies were able to produce from 14 percent to 81 percent of schedules in the first six months of 1946.

**Work, Wages Lost.** In the motor-vehicle manufacturers' plants alone, millions of man-hours of production were lost during 1946 as a result of strikes, shortages, and government controls. Total wages lost by employees of these companies in the period amounted to hundreds of millions of dollars.

Complete shutdown by strike of all plants of one producer which began November 21, 1945, continued until April 2. One effect of this strike was illustrated late in 1946 when the company announced that, up to November 15, it had produced only 884,413 units as compared with 2,057,506 in the corresponding period of 1941.

The experience of this company in efforts to maintain its schedules was typical of others in the industry. While the 113-day strike precluded attainment of schedules in the months immediately following the re-opening of its plants, the company was hampered throughout the year by continuing shortages of component parts, of steel, pig iron, lead, copper, tin, and zinc.

**Parts Flow Disrupted.** Strikes in supplier plants constantly disrupted the steady flow of parts prerequisite to the delicate timing of mass production. Statistics issued by one company revealed that, from early July to mid-October, between 52 and 72 strikes in supplier plants were interfering with production each week. As late as November 20, 1946, the same company reported that 30 strikes were in force in as many U.S. and Canadian supplier plants during the previous week.

Production schedules crumbled under the effects of an unbalanced flow of parts into assembly plants. One company was forced, after an earlier delay of 60 days, to suspend production for an additional month for lack of just one part—transmissions—held up by a strike in the plant of a supplier. At one point in July, another company had on hand enough bumpers for 2,300 trucks, but batteries for only 44, generators for 799, starters for 587, and fans for only 152. Lack of wheels threatened to halt truck assembly one mid-summer morning at a third plant. Only eleventh-hour delivery of a truckload of wheels kept production going.

While supplier strikes as a rule had immediate effects on motor vehicle production, the full impact of other shutdowns—particularly in basic industries—was not felt until months after they occurred.

The steel strike and the first coal strike of early 1946 caused the loss of 12,000,000 tons of steel. If automotive channels had received their normal percentage of this amount, it would have provided an additional 1,200,000 cars and trucks. In the closing weeks of the year, three automotive companies were forced to cut back production levels because of shortages of sheet steel. One reduced its daily output by 30 percent; the second trimmed schedules 10 percent, and the third—a major body pro-

ducer—was forced to lay off 7,000 employees and cut production. The effects of the second coal strike in the closing month of 1946 will continue into 1947.

A prolonged strike in the electrical industry delayed the construction and installation of new rolling-mill equipment in steel plants to increase production of sheet steel needed for bodies and fenders. As a result, this shortage was expected to continue until mid-1947.

**Restrictions Continued.** The flow of materials used in automobile and truck manufacture was restricted throughout 1946 by price control, although most of the controls were abolished by Presidential action on November 10, 1946. Other government controls affecting the automotive industry continued after this date, however. Import or allocation rules remained on lead, tin, antimony, and natural rubber, while diversion reduced the availability of steel, pig iron, tin plate, terne plate, lumber, and plywood.

As of November 10, more than 30 Civilian Production Administration regulations, directly affecting the automotive industry, still remained in force. These controlled, in one way or another, cotton textiles and fabrics, tin, steel, pig iron, antimony, burlap, and other materials.

Lead, needed for batteries, bearings and solder, was in short supply throughout 1946. Although the restriction on imports of the metal was lifted November 18, controls were continued on its use.

**Drastic Methods.** The year was marked by unusual steps taken by various producers to continue operations. Expenditures which are normally prohibitive were shouldered to keep production going.

In one case, nuts and bolts were shipped by air from Buffalo to Flint. In another, regular air-freight service was established between Detroit and upstate New York to keep a steady flow of one part coming to assembly lines when other sources were hit by strikes or material shortages. When a shortage of burlap developed, a company bought up a million sandbags in far off India.

A motor-truck adaptation of the old-time "pony express" was used over a 600-mile distance to prevent shutdown of an east-coast assembly plant when a supply of cushion springs was needed quickly. To keep production going in the face of a shortage of sheet steel, a company redesigned and re-engineered parts for automobile bodies without changing quality; shutdown was averted by stamping body-panels out of large pieces of stock used ordinarily for entire car roofs.

Another company paid a transportation premium of \$15 a ton on pig iron shipped from Utah to its foundries in Michigan; cost of the pig iron itself was \$26.50 a ton.

**Payrolls Soar.** Despite the lag in motor-vehicle production, employment and dollar payrolls throughout the U.S. automotive industry—assembly, parts and supplier plants—climbed to new peacetime highs in 1946. The payrolls reflected not only increased employment but higher base rates and abnormal overtime. By September, employment of wage earners totaled 764,000 and payrolls averaged nearly \$40,000,000 weekly. Employment and weekly payrolls in 1941 averaged 570,000 and \$22,568,000, respectively; in 1937, 505,000 and \$15,660,000; and in 1929, 471,000 and \$15,171,000.

Indicative of the efforts of the industry to increase production was the rise in employment of salaried workers. Staffs were expanded to expedite delivery of new machinery, parts, and materials, and to find new sources of supply when regular

sources were unable to make shipments. One company alone employed in the closing weeks of 1946 about 18,000 more salaried personnel than in 1941. Another company's salary payrolls were double the 1941 figure.

A mid-year tabulation showed that 27 percent of the industry's employees were World War II veterans. This compared with the all-U.S. industry average of 18 percent.

**Exports.** Government controls restricted automobile and truck exports to 6.3 and 20.44 percent, respectively, of annual production. Actual exports came below even the small total allowed, however. Only one of 17 cars was shipped abroad in 1946; more than half of exports went to countries in the Western Hemisphere. In 1937, U.S. automobile exports totaled over 272,000, and in 1929 approximately 451,000 cars went to overseas markets.

Under normal conditions, ten in every 100 American automotive employees owe their jobs to the foreign demand for U.S. cars and trucks. The industry in 1946 was confronted with the problem of supplying domestic demand and at the same time maintaining overseas markets in the face of sharply increased competition from manufacturers in other countries. British producers in 1946 were required to export 50 percent of their total automobile output, and French motor manufacturers exported 70 percent of their automobile production.

According to a world survey of motor vehicle registrations issued in the latter months of 1946, the war severely depleted the number of vehicles in use in many foreign countries. Denmark lost 81 percent of its cars, trucks, and buses. Losses during the war period in some other countries ran almost as high. Registrations in the Netherlands declined 51 percent; Belgium, about 65 percent; Philippine Islands, 77 percent; China, 74 percent; Norway, 54 percent; Luxembourg, 72 percent; Greece, 41 percent, and France, 36 percent.

**Operating Losses.** The year was characterized by substantial operating losses among motor-vehicle makers, offset to some degree by tax credits. The net loss of \$5,500,000 reported by passenger-car producers for the first three-quarters, computed after tax credits, was equal to more than one-fifth of a cent on every dollar of sales recorded for the period. In contrast, passenger-car companies averaged a net return of 3.97 per sales dollar, after taxes, in 1945; 2.6 in 1944; 3.1 in 1943; 3.56 in 1942, 6.45 in 1941; 7.07 in 1940, and 8.25 in 1939.

**Taxes.** Special taxes—federal, state, and local—on ownership and use of motor vehicles climbed to a new peak of \$2,300,000,000 in 1946. This total was \$150,000,000 higher than in 1941 and came mainly from the wartime doubling of federal excises against highway users. Enacted as temporary revenue measures in 1932, federal excises have increased steadily; of the 1946 total, federal excises alone amounted to \$732,000,000.

The buyer of a \$1,500 automobile in 1946 paid an average of \$133.74 in special taxes in the purchasing and first-year operation of the car. All but \$38.18 of this amount represented federal taxes.

Vehicle miles of travel in 1946 returned to pre-war peak levels, with an estimated 27,000,000 automobiles and 5,400,000 trucks in use. In 1941, 29,500,000 cars and 4,800,000 trucks were in operation. Thus, of the approximately 90,000,000 motor vehicles produced in the last 50 years (the Automotive Industry's Golden Jubilee was observed in 1946), over 32,000,000 were still in use.

The average motor vehicle on the road in 1946 was eight and one-half years old.

GEORGE W. MASON.

**MUSIC.** With the improvement of transportation, the international exchange of artists, traditionally so important in the field of music, took place more often during 1946, but still fell short of its prewar rate. Many celebrated musicians, notably composers, who had come to America when European conditions prognosticated war, remained and, from all indications, for good. Following Maggie Teyte, the British interpreter of French art-songs, who had been among the first of the veteran artists to resume international contacts (in 1945), Giuseppe De Luca, the famous baritone, returned to America, causing much less excitement than Miss Teyte. On the other hand, Pablo Casals refused invitations extended by both England and America for the reason that he did not approve of the recognition of Franco Spain by these two countries. The return of the pianists, Myra Hess and Guionar Novaes, was warmly greeted by American concert-goers.

Georges Enesco, Rumanian composer, conductor, and violinist, came here late in 1946 for his first visit since 1939. Benjamin Britten, young English composer, who had been here just before the war, visited this country briefly during the summer to witness the American premiere of his opera, *Peter Grimes*, which was conducted by Leonard Bernstein at Tanglewood in Lenox, Massachusetts, as part of the Berkshire Music Festival. The winter season marked the first visits to this country, also, of Zoltan Kodaly, Hungarian composer, and Manuel Rosenthal, French composer, perhaps better known as conductor. Rosenthal witnessed performances of his own works, and conducted performances of music by himself and other French composers.

Among those reciprocally representing the United States abroad were three young conductors, Leonard Bernstein, Bernard Herrmann, and Robert Lawrence. Arturo Toscanini conducted at La Scala during the summer, and Erich Leinsdorf, Vladimir Golschmann and others made conducting tours of the continent (see below). Samuel Barber, composer, went abroad to conduct some of his own music.

**Creative Activity.** The premières of Igor Stravinsky's *Symphony in Three Movements* and Aaron Copland's *Symphony No. 3* were distinct events in the creative sphere. Since his *Symphony in C* (1940), Stravinsky's orchestral music had been confined to such relatively light and serviceable works as a polka to accompany the dance of elephants at the circus, music for ballet in Billy Rose's *Seven Lively Arts*, and *Four Norwegian Moods*, a work of pleasant, short movements with some audience appeal. Copland, since his abstruse, highly significant and provocative *Short Symphony* (1933), had also become more and more involved, in his orchestral music, with works which, if not exactly programmatic, were conditioned by some ulterior subject matter—that is to say, they originally accompanied either movies or ballets, or presented impressions of his Mexican travels (*El Salon Mexico* and *Letter from Home*), or accompanied the speeches of a statesman (*Lincoln Portrait*). These symphonies thus marked the triumphant return of two of our foremost composers to the higher realities of abstract music. It is further significant that each was associated, at the inception of his symphony, with one of our major orchestras—the Copland symphony was commissioned by the Koussevitzky Foundation, virtually an auxiliary of the Boston Symphony, which premiered the work in its home city, October 18; while the Stravinsky Symphony was dedicated to the Philharmonic-Symphony of New York, which premiered it in its home city January 24. Both are vital

and outstanding achievements of our time, representing their creators at the peak of their activities.

Charles E. Ives, the veteran American composer who is slowly being recognized as a unique phenomenon in musical history, came in for some well-deserved recognition. Ives, who is now past seventy, has had to content himself most of his life with recognition by a small, faithful group of followers. At first this was restricted to his immediate friends. Earning his livelihood as a successful insurance man, he made no attempt to establish himself as a professional composer, and he had reproductions of his music made at his own expense to send to people who were interested in it. He continued to compose large symphonies and chamber works, undiscouraged by the fact that he almost never had occasion to hear them. Most important, he was already experimenting, early in this century, with the prophetic musical effects that later appeared as startling innovations in works of Hindemith, Schoenberg and others. His *Third Symphony*, which had idly rested for some forty years in a pile of music in a Connecticut barn belonging to Ives, finally was given its première, April 5 in New York, by the New York Little Symphony, with Lou Harrison as guest conductor. Shortly after this Ives was honored with a whole concert of his works, as part of the annual spring American Music Festival at Columbia University, when the symphony was repeated. Another performance was given later in a broadcast by the CBS Symphony under Bernard Herrmann's direction.

Virgil Thomson's untiring propagandism on behalf of French contemporary music in his columns in the New York *Herald-Tribune* was unquestionably rewarded with more and more results. Manuel Rosenthal was particularly fortunate, on his first visit here, in the number of his works heard under imposing auspices. The largest in scope was his choral work of about an hour's length, *St. Francis of Assisi*, premièred by the Philadelphia Orchestra under Eugene Ormandy. Many agreed on the expertness of his orchestration, but disagreement on the musical quality was sharp. Others of the less known composers, represented in this wave of French music, were Barraud and Sauguet.

Controversy over its *wunderkind* Dmitri Shostakovich once again arose in Soviet Russia. In the 'thirties his opera, *Lady Macbeth of Mzensk*, had been attacked for the bourgeois decadence of its ultra-modernism and shock elements. The *Ninth Symphony*, much shorter and lighter in vein than his previous mammoth and grandiosely expressive symphonies, was found to reflect so-called "unwholesome," retrogressive "neo-classicism" with which Stravinsky, arch-enemy of the official Soviet musical point of view, had become identified. Prokofiev's *Ode on the End of War* had its American première without much success. In the meantime, news arrived that Prokofiev was at work on a *Sixth Symphony in E-flat minor*.

Notable large choral works introduced during the first half of 1946 were: Paul Hindemith's *When Lilacs Last in the Dooryard Bloom'd*, a setting of the well-known Whitman poem; and the *Symphony: "The Airborne"*, by Marc Blitzstein, author-composer of *The Cradle Will Rock*, who dedicated his new choral work to the U.S. Army Eighth Air Force by which it had been commissioned. Blitzstein again wrote his own text, devoted to the history of human flight and its role in the last war. Part of it was spoken, with Orson Welles as narrator, at the première by the New York City Symphony under Leonard Bernstein. Notable, too, was the November revival of Stravinsky's monumental

*Oedipus Rex*, again under Bernstein—the first New York hearing of this great choral work in fifteen years.

Modern music festivals, curtailed during the war, were, to a certain extent, revived. Summer witnessed the first Yaddo Festival of contemporary American music since 1940. The Berkshire Music Center, which had resumed its suspended educational activities, also resumed, under Koussevitzky's direction, its major role in the presentation of large new works, including Britten's *Peter Grimes* and Shostakovich's *Ninth Symphony*, which had their United States premières there.

The Austrian section of the International Society for Contemporary Music, suppressed during the war, was revived, planning several concerts in Vienna for the 1946–1947 season. The columns of the *New York Times* noted that there had been flourishing activity during the war in Czechoslovakia in the publishing of new and old music.

Samuel Barber's *Concerto for cello and orchestra* received the award of the New York Music Critics Circle as the best new native work to have a New York première during the season 1945–1946. A well-merited citation was given David Diamond's *Rounds for String Orchestra* as the best native work of a previous season to have a second New York hearing in the season 1945–1946. Guggenheim fellowships in composition were given to William Bergsma, Henry Brant, Alexei Haieff, Gian-Carlo Menotti, Harold Shapero, Louise Talma. Special postservice Guggenheim Fellowships were given to John Lessard and John Verrall. In addition to the Guggenheim fellowship, Shapero received the annual Gershwin Memorial Prize for the first movement of his *Serenade for Strings*.

**Recitalists.** The chief issue discussed and disputed among musical executants and recital-goers was the matter of Maryla Jonas, Polish pianist who made her New York début at Carnegie Hall, February 25. Escaping from the continent after considerable hardship as a result of the Nazi occupation, she had finally found refuge in Latin and South America where she came into contact with Artur Rubinstein. For her début she came, obscure and unheralded, to New York. But on the day after her concert, glowing praise in the press immediately established her as someone to be reckoned with. "The finest woman pianist since Teresa Carreno," declared Jerome D. Bohm in the *New York Herald-Tribune*. Others compared her to Moriz Rosenthal and Vladimir de Pachmann. The musical élite, who, having had no forewarning, were absent from this event, were duly skeptical of these encomiums, as were those critics who had been engaged elsewhere that night. A second appearance was arranged soon after, and, as was to be expected, those who dissented did so drastically. When Miss Jonas returned to the concert platform in the fall, and made a further début on Victor discs, even some of her initial admirers cooled off. They still acknowledged her extraordinary dynamism and beautiful tone, but the impression seemed to be that she requires large, massive works to do her best. But as yet, she did not seem prepared with enough of these in her repertory to meet the demands of this sudden rise to fame. Musicians, however, looked forward with great interest to her future showings.

Despite the excitement over Miss Jonas, Vladimir Horowitz and Artur Rubinstein remained the top drawing-cards among piano recitalists. A single advertisement for two Carnegie Hall concerts by Horowitz in the *New York Times*, alone, was enough to sell them out within twenty-four hours.

Among violinists, Fritz Kreisler, who had celebrated his seventy-first birthday last February, was still going strong, last winter, and even made something of a come-back. While capacity audiences of hero-worshippers had continued to attend his previous recitals and other appearances, his intonation and vitality had been slipping considerably. But his Carnegie Hall recital in November found him in as good form as he had been for almost a decade.

Returning artists, such as De Luca, Hess, and Novaes, have already been mentioned in the introductory remarks, and others are mentioned in the section on opera.

**Opera.** Disagreements between the Metropolitan Opera Company and the American Guild of Musical Artists delayed the signing of contracts, and sale of subscriptions, and even threatened to prevent the 1946-47 season. The American Guild of Musical Artists comprises the opera's soloists, choristers and ballet, and it was when Metropolitan officials attempted to make some changes in the chorus that the complications arose. Eventually the management was permitted to determine the number and qualifications of its artistic personnel. A new contract was made to supplant the outmoded one that had been in force for eleven years, and this, added to new contracts with other unions, resulted in considerable increase in costs for running a season.

Italian opera again figured prominently in the season of 1945-46. Thus, there were 58 Italian as against 29 Wagner (despite the absence of the Ring) and 19 French operas (including a revival of *Contes d'Hoffmann*). Certain factors were favorable to an emphasis on Puccini, namely the fiftieth anniversary of *Bohème* (duly celebrated in two consecutive NBC broadcasts by Toscanini, who had conducted its première February 1, 1896) and the end of the war, which meant that *Madama Butterfly* could definitely be restored to the repertory. Increased interest in Puccini was also reflected in the revival of *Tabarro* at the Metropolitan and *La Rondine* at the Juilliard School of Music—two short operas that have been neglected in our repertory.

The cause of opera in English achieved a few minor victories. On the one hand were the translations of traditional operas, and on the other, a few new English and American creative efforts. Mozart's *Seraglio* in English was among the novelties of the Metropolitan's season of 1946-47. Doubtless this was motivated by the success of *Magic Flute* which, in the years since its revival in English, has enjoyed more performances than it had when previously given in any foreign language. *Fidelio* had also been a success in English. Among operas specifically composed on an English text, *The Warrior* (music by Bernard Rogers and libretto by Norman Corwin) was announced for the 1946-47 season—the first American opera to be undertaken at the Metropolitan in several years.

In the general field of opera, conceived with English text, Benjamin Britten was the newest white hope. Thus the same year that saw the American première of *Peter Grimes* at Tanglewood, witnessed the English première of still another Britten opera, *The Rape of Lucrece*, which followed rapidly on the heels of its predecessor. In the meantime, Gian-Carlo Menotti, America's white hope of several years back in the operatic sphere, was heard from again after several years of obscurity. His chamber opera, *The Medium*, was given in the spring by Columbia University, which promised the première of Virgil Thomson's newest collaboration with Gertrude Stein for the spring of

1947. Encouragement for opera in English was forthcoming from the Royal Opera House in Covent Garden, which opened in February with plans to make a state theater out of it, and to sponsor English national opera.

The New York City Opera Company, under the direction of Laszlo Halasz, gave further justification for its existence by emancipating itself from dull emulation of the Metropolitan. Thus it realized at last that its role was, in the first place, to experiment with operas that were not firmly enough entrenched in the repertory to warrant risk on the part of larger companies, whose overhead is so much greater. The revival of Tchaikovsky's *Eugen Onegin*, last given at the Metropolitan in 1920, was in this class. Also, the smaller resources of the New York City Opera Company were suitable for chamber operas, which are somewhat outside the interests of the larger grand opera companies. Hence, the successful production of Richard Strauss's *Ariadne auf Naxos* which, strange to relate, had never been given in New York before.

Set Svanholm, a new Heldentenor at long last capable of sharing Melchior's duties, made a successful début in *Siegfried* in November. A ranty these days, was his svelte figure consistent with the appearance of a young Nordic hero. The French conductor, Louis Fourester, made his United States début on the Metropolitan's opening night, conducting *Lakmé*, restored to the repertory for the first time since 1942. Shortly afterwards, Fritz Stedry made his Metropolitan début, as conductor of *Siegfried*. Revivals in addition to those mentioned included Moussorgsky's *Boris Godounoff* (out of the repertory since 1943) and Humperdinck's *Hansel and Gretel* (out since 1939). *Faust*, *Marriage of Figaro*, *Aida*, *Troçatore* and *Siegfried* were restored after a season's absence.

**Orchestras and Conductors.** Wilhelm Furtwängler, the veteran German conductor, was the subject of international controversy when he was invited by the Mayor of Berlin to return and help direct its cultural revival. Accused of having been a Nazi "tool," he was barred from appearing on the podium of the Berlin Philharmonic by American officials in whose sector the orchestra was located. The Russian occupation authorities favored his return, and brought him into their area. The case was appealed, and though no hearing had been given it for several months, it seemed highly probable, after unofficial consideration, that it was only a question of formality before Furtwängler would be permitted to resume his duties.

The first postwar season of the Czech Philharmonic was also the occasion for an International Festival at Prague, in celebration of the fiftieth anniversary of the orchestra's founding. Conductors from various countries were invited to give representations of their respective native musical literature: Bernstein from the United States; Munch from France, Boult from England, and Mravinski from Russia. Another fiftieth anniversary was celebrated by the National Symphony of Washington, D.C., whose conductor, Hans Kindler, took the orchestra on a tour of South America, which also welcomed the ubiquitous Stokowski.

Dmitri Mitropoulos shared conductorial duties with Toscanini at La Scala, which had been rebuilt under the latter's solicitous guidance, after having been ravaged in 1943. Mention has been made above (in the introductory remarks on music) of other activities relative to international musical exchange.

Carlos Chavez brought credit to his Mexico Symphony by presenting an active summer festival

season of new music, inviting Stravinsky, Hindemith and Milhaud to appear as composer-conductors with the orchestra in rapid succession.

Special significance was attached to the appointment of George Szell to succeed Leinsdorf in the fall of 1947 as conductor of the Cleveland Orchestra. This orchestra has been, in the past, a sort of conductors' ante-chamber to the New York Philharmonic. Rumor had it that Szell was being primed for the assumption of the challenging New York post at a future date.

Activities of the smaller symphonies were notable. Bernstein's repertory with the New York City Symphony emphasized re-hearings of worthy contemporary works that had disappeared from the repertory after one or two hearings during past seasons. Smaller symphonies, such as the Buffalo, New Jersey, and Columbus, increased their budgets in order to get into the "big league."

A trend towards Strauss operas in concert form was observed on symphony programs: *Elektra* (Detroit Symphony); excerpts from *Der Rosenkavalier* (New York City Symphony); and the little known *Frau ohne Schatten* (Dallas Symphony), which, added to the New York City Opera Company's revival of *Ariadne auf Naxos*, indicated increased attention to the German composer.

**Obituary.** Paul Rosenfeld (died New York, July 20) was a sad loss to Avant garde American circles. He had been the first to defend many now accepted modern composers at a time when others had ignored them. A major figure in contemporary music passed away with Manuel de Falla (Argentina, November 14). The composer, Sir Granville Bantock died in London, October 16, and the virtuosos pianist, Moriz Rosenthal died in New York, September 4.

**Ballet and Dance.** Though several rival ballet companies operated at once in 1946, the results, in terms of artistry of performance and creativity, were below the level of what had been achieved in the previous year. Serge Denham's Ballet Russe, laboring against the odds of less financial backing and fewer stellar personalities, still was notable for the most consistent excellence, largely because of George Balanchine's unofficial connection with the company and the number of his ballets in its repertories. Once again, however, this company's attempts in the direction of American choreographic art were feeble. Ruth Page's *The Bells*, based on Poe's poem, with music by Darius Milhaud, had mainly the fine décor and costumes of Isamu Noguchi to recommend it.

The troupe of Lucia Chase and Oliver Smith, Ballet Theater, gave far more interesting spectacles than the forces under the more opulent aegis of Sol Hurok, with whom this company had formerly been connected. For his New York season at the Metropolitan Hurok was left with a hybrid group whose nucleus was the Original Ballet Russe of Colonel de Basil, which returned to this country after a long absence. Augmenting this, in Hurok's company, were the Markova-Dolin company, some remnants (though notable ones) of the short-lived Ballet International, and a few elements that had broken away from Ballet Theater. Lacking integration in terms of a common ideal, ballet at the Metropolitan, despite the advantages of that house for setting stage action in relief, was a rather loose affair. Among the brighter spots were two revivals from the repertory of the de Cuevas Ballet International: William Dollar's *Constantia* and, to a lesser degree, *Mute Wife* by Antonia Cobos. Dollar affirmed his position as a choreographer to be reckoned with, while Cobos gave indication of sensi-

tivity and aptitude that might possibly be crystallized at a future date. The Ballet Russe novelty *Camille* was not a success, for the talents of John Taras, as indicated in his previous and first attempt, seemed less adaptable in their present stages to a story ballet than to an abstract work. North American premières of David Lichine's *Cain* and Abel and Vania Psota's *Yara* revealed little of consequence.

A good deal of interest centered on Ballet Theater's novelty, *Facsimile*, by Jerome Robbins, whose first attempt, *Fancy Free*, had created quite a sensation in 1944. In the interim he had written a short work, *Interplay*, for a Billy Rose revue on Broadway. But *Facsimile* was his second ballet made specifically for a ballet company, and it was his first effort with a serious subject. Once again, his dance inspirations showed that he is a big force among younger American creators, but his newest product was interlarded with rather naive attitudes and theatrical tricks connected with human insecurity and frustration, and the net result was somewhat empty. As in *Fancy Free*, Leonard Bernstein and Oliver Smith were collaborators on the musical and scenic ends, respectively.

To complete the record of Ballet Theater's activities, it should be mentioned that it started out its career under its new directors with a trip to England. With Antony Tudor as its artistic director, and with most of this British choreographer's ballets in its repertory, the company naturally found ready acceptance there.

ARTHUR V. BERGER.

**NARCOTIC DRUGS CONTROL.** International control of traffic in narcotic drugs was reconstituted within the framework of the United Nations organization in 1946. The Commission of Narcotic Drugs of the UN held its first meeting at Lake Success, New York, on November 27, taking over the activities which had been carried out with considerable success by the Opium Advisory Committee of the League of Nations.

The new Commission, which is a part of the Economic and Social Council of the UN, presumably will also integrate its work with the other international control body, the semi-autonomous Permanent Central Opium Board.

Mr. H. J. Anslinger, United States Commissioner of Narcotics, is the United States representative on the Commission on Narcotic Drugs. He had as advisor during deliberations of the Commission, George A. Morlock of the Division of International Labor, Social and Health Affairs, the United States Department of State.

Announced intention of the Government of Iran to abolish opium production in that country constituted another important step toward the drying up of sources of illicit narcotics. Iran, together with Burma and India, has constituted a major source for such drugs for a number of years. The action of Iran followed the lead of Afghanistan taken in 1945, and the decisions of the Governments of the Netherlands, Great Britain, and France to eliminate opium distribution in certain of their territories in the Far East.

No positive steps toward elimination of the traffic in Burma or India have been taken.

United States and other allied military authorities during 1946 continued to impose strict controls over stocks of narcotic drugs discovered in liberated and enemy countries, to prevent the diversion of such stocks into illicit channels. After the First World War the breakdown of controls permitted huge stocks of drugs to fall into the

hands of international smugglers, which diversions contributed to a virtually world-wide wave of addiction.

In areas freed from Japanese control, United States military authorities under the direction of General Douglas MacArthur made large seizures of drugs and took positive steps to stamp out production and traffic in opium and its derivatives.

The United States Treasury Department cooperated closely with Allied occupation authorities in these efforts to corral surplus drug supplies in war torn areas.

**National Control.** Seizures of drugs in the United States internal traffic, and by Customs at ports and borders, declined moderately during the year ended June 30, 1946, as compared with the similar 1945 period. The total 1946 seizures were 8,661 ounces, against 10,285 ounces in 1945. A shift in the volume of shipping away from "infected areas," with an attendant drop in seizures at the ports was the major factor in this decline.

Mexico, together with the far eastern areas hitherto mentioned, remained a major source of illicit supplies reaching this country despite active efforts of the Mexican Government to stamp out the traffic.

Arrests for violation of narcotic laws increased in number while the volume of drugs seized declined, the total for 1946 being approximately 1800, compared with 1500 in 1945. Wholesale indictments against peddlers and middlemen were obtained in several states.

Marihuana arrests and seizures increased, with arrests totaling about 850, some 200 more than in 1945; and seizures aggregated 12,445 ounces against 12,325 ounces in 1945.

Extremely high prices continued to prevail for narcotic drugs in the illicit traffic, and the product eventually reaching addicts, in most cases, was highly adulterated.

Reflecting the scarcity from other sources, burglaries, robberies, and larcenies from pharmacies, wholesale houses, and other registered establishments were reported in substantial numbers. There were numerous cases of forgery of prescriptions and attempts to obtain drugs by misrepresentation.

Significant of the great strides made toward stamping out addiction to narcotic drugs in the United States is a report of military authorities to the effect that roughly about 1 man in 10,000 selective service registrants examined for military duty during the recent world struggle was rejected on this ground, compared with rejection of 1 man in 1500 in the much smaller army of World War I.

While it is too early to reach any conclusion on the longer range aspects, experience thus far indicates that there has not as yet appeared any rising trend in addiction such as has followed previous wars.

Addiction to and diversion of the synthetic, morphine-like drug, Demerol accounted for a number of cases developed by the Bureau of Narcotics during 1946.

H. J. ANSLINGER.

**NARCOTICS, Bureau of.** A Bureau of the U.S. Department of the Treasury, established in 1930.

**NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS.** An independent Committee of the U.S. Government which coordinates and conducts aeronautical research. The principal research laboratories of the Government are the Langley Memorial Aeronautical Laboratory at Langley Field, Va., the Ames Aeronautical Laboratory at Moffett Field, Calif.

and the Aircraft Engine Research Laboratory at Cleveland, Ohio. Chairman: Jerome C. Hunsaker.

**NATIONAL ARCHIVES, The.** An independent establishment of the U.S. Government, created in 1934, which accepts and preserves Government records. Archivist in 1946: Solon J. Buck.

**NATIONAL BUREAU OF STANDARDS.** Established by act of Congress, March 3, 1901, the National Bureau of Standards is the principal agency of the Federal Government for fundamental research in physics, chemistry, and engineering. During 1946 the Bureau consisted of eleven scientific and technical divisions and three concerned with commercial standardization. The scientific and technical divisions were: Electricity; Metrology (formerly Weights and Measures); Heat and Power; Optics; Chemistry; Mechanics and Sound; Organic and Fibrous Materials; Metallurgy; Mineral Products (formerly Clay and Silicate Products); Ordnance Development (including electronics); and Radio Propagation. The standardization divisions were: Simplified Practice; Trade Standards; and Codes and Specifications.

Dr. E. U. Condon, Director of the Bureau, served as scientific advisor to the Special Senate Committee on Atomic Energy, and was a member of the President's Evaluation Commission at the atomic bomb tests conducted by the army and navy at Bikini Atoll. Dr. H. L. Dryden, chief of the Mechanics and Sound Division, and Dr. E. C. Crittenden, former chief of the Electricity Division, were appointed Associate Directors.

The Bureau's direct appropriation for 1946 was \$3,588,000, and this was supplemented by approximately \$8,500,000 transferred by the army, navy, National Defense Research Committee, and other government agencies. The staff at the end of the year totaled a little over 2,300. In addition, 65 persons were engaged under the Research and Industrial Fellowship Plan.

As in past years, the Bureau was active in technical societies and trade associations concerned with the applications of scientific research and with standardization. Members of the Bureau's staff also served on committees, and as officers of such organizations as the Federal Specifications Board, the Joint Army-Navy Battery Advisory Committee, the International Committee on Weights and Measures, the International Electrotechnical Commission, the National Conference on Weights and Measures, and other technical groups.

Representative of the war research projects continued during 1946 were the development of special batteries, interior ballistics, lightning hazards to aircraft, optical range finders, chemical analysis of secret materials, jet propulsion combustion, solid fuel combustion in high-velocity air streams, aviation fuels, radar homing missiles for use against moving targets, proximity fuzes, aerodynamics of bombs and rockets, oxygen equipment for high altitude aircraft, the metallurgy of uranium, and leak-proofing methods for concrete gasoline tanks.

Two of the noteworthy contributions of the Bureau to the war effort, on which work continues, were the VT (proximity) fuze and the guided missile. The Bureau was responsible for the invention of the basic radio fuze and for the development and engineering of such fuzes for bombs, rockets, and mortar shells. In this program the Bureau served as the sole research and development agency for the National Defense Research Committee, and now performs the same function for the Army Ordnance Department. The Bureau also developed the guided

missile "Bat," the only fully guided automatic missile used successfully in combat, continuing this type of development in the "Kingfisher" project in 1946.

Work in nuclear physics continued during the year. Projects included the calorimetric measurements of secret materials, research in isotope separation, mass spectrometer measurement of isotope ratios, studies in neutron absorption, analysis of ores of uranium and other heavy elements, research in beta and gamma ray spectra of radioactive isotopes and in alpha ray emission of such isotopes, and the development of new methods of test. In addition, beta and alpha ray standards were developed in laboratory form. Related projects included the designing of a 100,000,000-volt betatron, tests of Geiger-Muller counters and associated electronic equipment, testing of over 3,000 radium samples, preparation of safety codes for x-ray and radium protection, and the construction and operation of 1,500,000-volt x-ray tube.

Prior to the war considerable work was done at the Bureau in radio propagation, which includes ionospheric research, propagation and measurement, microwave research and measurement, and frequency utilization service. During the war the ionospheric group at the Bureau became the centralizing unit in the United States for ionospheric data taken all over the world. This group was given division status on May 1, 1946, with the formation of the Central Radio Propagation Laboratory, Division XIV of the Bureau. Ionospheric data, received from 55 ionospheric stations scattered throughout the world, are gathered and analyzed and the results are disseminated to the armed services, commercial users, scientists, and laboratories.

Basic research on the fuel qualities of hydrocarbon components of petroleum was conducted to improve military aviation gasoline. Hydrocarbons of the types in petroleum were prepared in high purity, and their physical and engine properties were determined. Many new compounds, some having unusually compact structures, were prepared. A number of these compounds far surpass the fuel qualities of present military aviation gasoline and offer possibilities of improved fuels for the future.

In cooperation with the American Petroleum Institute, an additional 32 standard samples of hydrocarbons, bringing the total to 92, were prepared for calibrating spectrometers and other analytic instruments in the petroleum, rubber, chemical, and allied industries.

Improved procedures were devised for controlling the quality of the synthetic rubbers produced in the 15 government-owned plants. Means were worked out for better temperature control during the mixing and vulcanizing of test lots of rubber. Tensile testing was critically investigated and procedures devised for tracking down discrepancies between laboratories.

Progress was made in the methods used to produce various types of diamond tools with the aid of the electric arc. Experiments applying the high voltage arc to cutting on the different crystal faces of diamond improved the production of industrial tools and also the cutting of gems. Applied to the diamond saw, the arc makes cutting possible in directions where no progress could be made without its aid.

The Chemistry Division issued 325 different kinds of standard samples, for checking methods of chemical analyses in industrial and scientific laboratories and as standards for physical measurements. New samples include a tin-bearing steel,

tungsten steel, two nickel-chromium-molybdenum steels, and four pH standards.

An electron tube laboratory was established during the year as a part of a newly formed Electronics Section, and a program of basic and applied research was undertaken. Projects initiated included the study of thermionic and secondary emission; the study of the electro-mechanical performance of electron tubes and the development, improvement, and intercomparison of test methods and equipment for evaluating standards of performance and quality of electron tubes.

A few other representative projects of the year included underground corrosion of metals, high voltage research, dental materials, thermal expansivity, lubricating greases, optical glass, porcelains and refractories, ceramic coatings for aircraft exhaust stacks, basic elements for electronic computing machines, electronic measurement instruments, optical crystals, sugar research, photometry of phosphorescent materials, extraction of alumina from clays, lateral contraction of some structural alloys, properties of sound wave fields, fundamental investigations of air flow, high polymer research, fatigue in metals, powder metallurgy, and building materials and structures.

The test work of the Bureau during the year totaled approximately 250,000 tests and calibrations (including the furnishing of standard samples) valued at \$1,200,000. Representative activities of this nature included the calibration of approximately 77,000 thermometers of various kinds, over 60,000 hours of performance and life tests on engines, the testing of 200 refrigerators, preparation and distribution of 21,000 standard samples of chemicals, approximately 40,000 tests of some 6,000 chemical samples, calibration of about 900 water current meters, examination of 5,300,000 barrels of Portland cement for various government agencies, factory inspection of about 4,000,000 lamps purchased by the government and life-test of over 3,000 at the Bureau, almost 19,000 tests on miscellaneous materials (such as concrete and concrete aggregates, soils, paints, textiles, water, soaps, oils, and metals), and others.

A total of 145 research papers were published in the Bureau's series of publications; and 79 articles appeared in scientific and technical journals. Nine new mathematical tables were made available to the public, bringing the total to 75. The Bureau's publications are available in the leading libraries throughout the country. An indexed list of publications (Circular C24 and supplements) is obtainable from the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

HUGH ODISHAW.

**NATIONAL DEFENSE, Council of.** A Council composed of the Secretaries of War, Navy, Interior, Agriculture, Commerce, and Labor, originally created by Act of Congress, Aug. 29, 1916. The Act authorized appointment of an Advisory Commission to the Council, composed of seven persons having specialized knowledge in certain fields. Such an Advisory Commission was appointed May 29, 1940, and constituted the beginning of the National Defense Program for World War II; its functions were subsequently absorbed by other agencies. The agencies evolved from the Advisory Commission, except for the Office for Agricultural War Relations and the Office of Price Administration, are now units of the Office of Emergency Management.

**NATIONAL HOUSING AGENCY (NHA).** The National Housing Agency was created by executive order

of the President on February 24, 1942, to centralize non-farm housing responsibilities formerly assigned to more than a dozen agencies. Policy decisions are made in the office of the Administrator and operations are carried out through three major constituent units: the Federal Home Loan Bank Administration, the Federal Housing Administration, and the Federal Public Housing Authority.

To launch a full-scale attack upon the veterans' housing emergency, the Office of the Housing Expediter was created by Executive Order 9686 on January 26, 1946. Under the Housing Expediter, who was also appointed Administrator of the National Housing Agency eleven days later, the Veterans Emergency Housing Program was launched on February 8. On December 31, 1946, the home construction record of the Veterans Emergency Housing Program was as shown in the accompanying table.

Total Units Begun in 1946	1,003,600
New Permanents	670,900
Conversions	64,500
New Trailers	48,000
Temporaries	191,000
Other Public Bodies and Schools	29,200
Total Units Completed in 1946	661,900
New Permanents	453,800
Conversions	45,300
New Trailers	48,000
Temporaries	101,900
Other Public Bodies and Schools	12,900

NHA was well-equipped, in organization and experience, to carry out the Veterans Emergency Housing Program. It had administered, from 1940-45, a war housing program in which more than 2,000,000 dwelling units were put under construction, all but about five percent being completed by V-J Day. More than 700,000 additional units were built outside the program, most of them before 1942, when Government housing regulations went into effect. Private investment supplied more than a million units of war housing with a private investment of nearly five billion dollars. This was enough to keep a core of our building industry active to meet imperative needs and in stand-by condition for the post-war job to come.

On October 15, 1945—two months after the war ended—WPB Order L-41, the war measure which restricted non-residential construction and limited residential building to quotas established by the National Housing Agency, was lifted, and sales price ceilings and priorities for materials were abolished. The result was a boom in non-residential construction, chiefly at the expense of home building. War-curtailed building materials producers and distributors were not yet ready to meet the tremendous demand. Many home builders found themselves unable to compete for scarce materials against commercial and industrial builders. Residential construction declined accordingly.

Meanwhile, the nation's long-standing housing shortage became a housing emergency. As of October 1, 1945, 1,200,000 families were living doubled up with other families. More men were leaving the armed forces in one month than the largest number of houses America had ever built in one year. Vacancy rates in most cities and towns had dropped to all time lows. It was estimated that something near three million new dwelling units would be needed by the end of 1947 just to keep the shortage from getting worse.

On December 31 of that year, Title V of the Lanham Act was amended to provide \$191,900,000 to aid in providing re-use war housing to communities and educational institutions for veterans ac-

commodations. (Another \$253,727,000 was appropriated under the same act on April 9.)

With the plight of homebuilders steadily growing worse, the government began to restore controls over housing at the turn of the new year. The Civilian Production Administration issued Priority Regulation 33 on January 15, this established a priority system (to be known as "HH priorities") covering 11 critical materials applicable to the construction of veterans' housing costing \$10,000 or less or renting for \$80 or less a month per unit. Subsequent amendments raised the number of building materials under HH priority ratings to include almost every type of scarce material.

To coordinate these individual approaches to the housing emergency, and to overcome the veterans' emergency housing problem, the Office of the Housing Expediter was established.

The Housing Expediter was authorized to formulate plans and programs to provide for an increased supply of housing for veterans of World War II, coordinate the activities of other executive agencies to carry out such plans and programs, recommend needed legislation to the President, and consult and cooperate with other national and local agencies, organizations, and industries to solve the housing emergency. On February 7, the Housing Expediter submitted the Veterans Emergency Housing Program to the President, who approved it the following day.

The program set up a goal of 1,200,000 moderately-priced homes and apartments for veterans under construction by the end of 1946. It mapped out a campaign—stimulation of building materials production; limitation on the prices and rents to be charged for new houses, sales and rental preference for veterans, servicemen, and non-veteran hardship cases; cutting down of deferrable non-residential construction; priorities and allocations of scarce materials and equipment to home builders; channeling the bulk of building materials to moderately-priced housing, construction of some 200,000 temporary housing units with funds authorized by Congress; recruitment of 1,500,000 additional workers; organizing community action programs.

The first order issued under the new program was Veterans Emergency Housing Program Order 1, on March 26. It called for deferment of new, unessential, non-residential construction to ease the strain on the many critically short building materials and thus make more of them available for veterans' housing, restricted all new housing to that covered by priorities at \$10,000 or less, and required authorization to start any major construction work.

To aid construction of both rental units and moderately-priced housing, a channeling order was issued on April 21, requiring 25 percent of all HH authorizations reserved for rental housing, and 50 percent of both rental and sales construction to be priced at or below local dividing lines. These dividing lines were based on the local current cost of producing a minimum acceptable two-bedroom house, as determined by FHA standards.

The Veterans Emergency Housing Act, passed by Congress on May 22, reaffirmed the powers granted the Housing Expediter by the President. Its chief provisions: (1) authorized \$400,000,000 for premium payments to stimulate production of critically-needed materials; (2) restored Title VI of the National Housing Act to operation by adding a billion dollars to the amount of home mortgage loans made by private lending institutions which the Federal Housing Administration may insure

under this Title, while permitting the Federal Housing Administration to insure mortgage loans up to 90 percent of the "necessary current cost" on the property involved, including land; (3) authorized the Housing Expediter to guarantee markets for prefabricated houses and new types of materials; and (4) provided \$15,000,000 for the building of access roads to hitherto inaccessible government timber stands.

The first premium payment plan authorized under the Veterans Emergency Housing Act became effective June 1. It set up a system of incentive payments to manufacturers of structural clay products—one of the most critically short building materials; under it producers would be paid \$5 for each 1,000 standard brick equivalents manufactured over established quotas. By November 1, eleven premium payment plans were in effect, covering the major critical building materials.

By mid-year it was apparent that authorized non-residential construction was draining an undue amount of critical building materials away from home building. At the request of the Housing Expediter, the Civilian Production Administration ordered its field offices on May 30 to reduce the dollar value of non-housing construction authorizations by two-thirds for at least the next 45 days to keep building in line with materials supply. Permitted non-housing construction was subsequently curtailed twice.

July, August, and September saw further amplification of the Veterans Emergency Housing Program.

The major action of August was the announcement of the "big push" to get more materials into veterans' housing, so that more homes could be completed before winter set in and more new home construction get under way. The "push" consisted of (1) setting-aside a much greater proportion of scarce building supplies for housing; (2) adding many critical building items to the list of materials under priority control, (3) obtaining stricter compliance by closer inspection of the sale of building materials, and (4) cutting the volume of non-housing construction sharply with a more rigorous review of the essentiality of such construction. "Set-asides" were increased to make it possible for priority holders to obtain needed building materials more rapidly. This was done not only by increasing the proportion of material which must be held by dealers for priority orders, but also by requiring the dealer to hold this material until a priority order was presented. Heretofore the dealer had been required to "set-aside" this material for only 21 to 30 days for priority orders, after which time he could sell to any purchaser.

Further actions were taken during October to speed up the flow of materials to veterans housing. More building materials were placed under priority ratings and more were ordered "set-aside." In addition guaranteed markets were signed with three firms producing prefabricated housing. A fourth was signed in November, with several others pending.

By December 31, a recapitulation of the results of actions taken by the Veterans Emergency Housing Program showed both a sharp increase in building materials and a rapid expansion of construction activity through the combined effort of builders, labor, and government.

The record showed not only 1,003,600 dwelling units started and 661,900 completed, but also dramatic increases in the production of building materials. Lumber production for 1946 was expected to be about 34,500 million board feet, an

increase of 23 percent over 1945 and close to the high levels of 1941 and 1942. Preliminary figures showed brick output more than double that of 1945, and almost equal to 1941 production. Production of gypsum board and lath for the year set a new all-time record. Many of these production increases were due to such government aids as materials allocations, price adjustments (over 250 in 1946), priorities assistance for raw materials and equipment, and premium payment plans. Over 730 Mayors' Emergency Housing Committees had been organized to plan and direct all phases of the local attack on community housing problems.

Thus, by the completion of 1946, homebuilding had risen from the low wartime level to one of the highest levels in 20 years. Production of most building materials jumped to record or near-record levels and ranged from 50 to 100 percent higher than during the early months of 1946. Even the removal of price controls on building materials on November 4 was less serious than it would have been without such production in nearly every field of building materials.

On December 14, following the decontrol of prices in November, the Veterans Emergency Housing Program underwent considerable revision. The Office of the Housing Expediter and that of the Administrator of the NHA were separated. Several restrictions were lifted: the priority system was replaced by a simple permit system; the \$10,000 sales ceiling on new homes was replaced by a limit of 1,500 square feet of floor area per house, and non-veterans as well as veterans were permitted to build for their own occupancy. The limitation on non-residential construction was modified, and the ceiling of \$80 for rental of new multiple-unit projects was changed to an average monthly rental of \$80. The Federal Housing Administration was granted another billion dollars of insurance authorization to be used primarily for rental housing. The guaranteed market plan, allocations of raw materials for housing items, export controls, and apprentice training and technical research programs were to be continued. In announcing the new program, the President stated that the main point of emphasis in 1947 would be rental housing.

**Federal Home Loan Bank Administration (FHLBA).** The Federal Home Loan Bank Administration directs the operations of the Federal Home Loan Bank System and the Federal Savings and Loan Insurance Corporation; two permanent agencies established to encourage home ownership and economical home financing and to protect savings. The Administration supervises Federal savings and loan associations. FHLBA also directs the Home Owners' Loan Corporation, an emergency agency founded during the depression to aid distressed home owners who faced foreclosure. HOLC is now in liquidation.

**Federal Home Loan Bank System.** Established in 1932, the Federal Home Loan Bank System provides a nation-wide home-mortgage credit reserve for thrift and home-financing institutions somewhat comparable to the Federal Reserve System in the field of commercial banking. Eleven regional Federal Home Loan Banks serve member home-financing institutions in their respective areas by making short-term and long-term loans to them. Through the regional Banks, funds may be shifted from areas of abundant credit to areas of scarcity. Since their establishment, they have advanced \$1,872,000,000 to their member institutions, of which \$234,762,000 was outstanding on Sept. 30, 1946.

Of the 3,702 member institutions of the System, 3,665 are savings and loan associations, cooperative banks and homestead associations. Of the remaining member institutions, 25 are mutual savings banks and 12 are insurance companies. Assets of members amount to more than \$9,696,000,000. The System is self-supporting.

**Federal Savings and Loan Associations.** Under a law enacted in 1933, the Federal Home Loan Bank Administration is authorized to charter and supervise Federal savings and loan associations, which are private mutual savings and home financing institutions. Charters may be granted to newly-organized institutions or those converting from state charter. On September 30, 1946, there were 1,474 such associations in operation with combined assets of \$4,470,000,000. Federal associations are required to be member institutions of the Federal Home Loan Bank System and must be insured through the Federal Savings and Loan Insurance Corporation.

**Federal Savings and Loan Insurance Corporation.** In 1934 Congress provided an insurance program for investors in savings and loan associations and similar home-financing institutions by creating the Federal Savings and Loan Insurance Corporation. Insurance is optional for state-chartered associations. Public confidence, inspired by the fact that investments are so safeguarded, has encouraged the flow of funds into insured associations. About 4,751,000 investors in 2,497 savings and loan associations, with combined assets of more than \$7,012,000,000 are now protected by insurance up to \$5,000 each. The FSLIC is self-supporting.

**Home Owners' Loan Corporation.** During the three years after its creation in 1933, the HOLC refinanced delinquent mortgages on more than a million homes by providing low-interest long-term loans, which since then have enabled most of the owners to retain their homes. In these rescue operations, \$3,093,000,000 was loaned, an amount later increased to nearly \$3,500,000,000 through advances to borrowers and other costs.

Up to October 31, 1946, about 81 percent of this investment had been liquidated by collections on the loans and the sale of properties securing its mortgages which HOLC was obliged to foreclose. A balance of \$666,000,000 was outstanding on that date.

Since 1936 the primary functions of the Corporation have been to collect payments due and liquidate its assets, as well as to aid its borrowers to meet their payments. Although the agency acquired a total of 198,189 houses, all but 144 have been sold. Most of them were marketed before the outbreak of the war and the ensuing boom in real estate values.

On October 31, 1946, the remaining number of borrowers' accounts had been reduced to 399,875. About 604,000 borrowers and purchasers of HOLC houses had paid off their mortgage balances in full.

During the 12 months ending October 31, HOLC made a net operating profit of \$23,000,000 after paying all administrative and other costs, plus bond interests. The cumulative losses of \$338,000,000 taken by the Corporation—in the sale of houses it was obliged to foreclose over the years of its operations—had been reduced by net earnings to a balance of \$28,000,000 on October 31.

It is now apparent that, when liquidation is completed, the Corporation will be able to pay back to the U.S. Treasury its \$200,000,000 of original capital intact, plus a moderate return. Probable losses ranging up to a billion dollars had been widely forecast when the Corporation was set up in 1933 to aid insolvent home owners, relieve dis-

tressed financial institutions of defaulted loans and restore deflated real estate and mortgage values.

**Federal Housing Administration (FHA).** The Federal Housing Administration was established in June, 1934, by the National Housing Act "to encourage improvement in housing standards and conditions, to create a sound mortgage market, and to provide a system of mutual mortgage insurance."

Under the Veterans Emergency Housing Program, the FHIA is the operating constituent of the NHA which processes and issues priorities on materials for housing for veterans. It also insures home loans which meet FHIA conditions.

The FHA does not lend money but insures residential mortgage loans made by private lending institutions and also insures lenders on property improvement loans. The maximum interest rate, under Title II of the National Housing Act, is  $4\frac{1}{2}$  percent plus the FHA insurance premium of  $\frac{1}{2}$  of 1 percent, both calculated on annual outstanding balances.

In peacetime, FHA insurance normally is governed by Titles I and II of the National Housing Act. Title VI was added as a defense war measure.

**Title I** provides for FHA insurance of qualified financial institutions on loans for property improvements, alterations, and repairs. Although loans for these purposes ordinarily are limited to a maximum amount of \$2,500 and a maximum term of 3 years, loans up to \$5,000 for terms up to 7 years are insurable if the funds go to provide additional housing accommodations for veterans. Title I loans are repayable in monthly installments.

**Title II** provides for insurance of mortgage loans ranging up to \$16,000 made by approved lending institutions. All loans are amortized in monthly payments and under certain circumstances may be repaid over periods of as long as 25 years.

**Title VI** was added to the National Housing Act specifically to assist in providing housing for defense and war workers. A separate Housing Insurance Fund, non-mutual in character, was established. FHIA temporarily stopped taking applications for Title VI loans in September 1945 when its authorization was virtually used up, but such insurance was resumed in May 1946 upon the approval of the Veterans Emergency Housing Act.

Mortgages insured under Title VI are limited to a maximum of \$5,400 on a single family house; \$7,500 on a two-family house; \$9,500 on a three-family house; and \$12,000 on a four-family house. Insured loans may cover up to 90 percent of necessary current costs. In areas where builders cannot provide sound standards of construction, design, or livability within these limits, the Federal Housing Commissioner may permit maximum mortgage amounts up to \$8,100 on a single family house; \$12,500 on a two-family house; \$15,750 on a three-family house; and \$18,000 on a four-family house.

Title VI authorizes FHA also to insure mortgages on large-scale rental projects for a maximum of 90 percent of FHA cost estimates.

Before FHA resumed Title VI insurance in May, 1946, with a total insurance authorization of \$1,800,000,000, it had insured loans for approximately 450,000 dwelling units for war workers. Amendments permit FHA to issue additional insurance up to \$1,000,000,000 for housing for veterans and members of the armed forces. This may be increased with the approval of the President by an additional \$1,000,000,000.

From July, 1940, up to the surrender of Japan, more than 750,000 new privately-financed dwelling units went into construction under FHA inspection.

The long-term program of the FHA has enabled

more than 1,760,000 families to build, purchase, or refinance their homes or to rent modern quarters. FHA insurance written under Title II amounted to more than \$5,442,000,000 as of November 30, 1946, and FHA-insured property improvement loans under Title I exceeded 6,064,000 in number and aggregated \$2,427,000,000.

In addition to being self-supporting, the FPHA has been able, under the participation provisions of the Mutual Mortgage Insurance Fund, to declare on certain groups of mortgages 41,000 dividends through March 31, 1946. By January 1, 1946, equity balances had accumulated in a total of 81 groups. Dividends will be received eventually by approximately 226,000 mortgagors who still remained in these groups on that date.

**Federal Public Housing Authority (FPHA).** The Federal Public Housing Authority has responsibility for federally-financed public housing functions. At the beginning of 1946, the FPHA had four principal assignments:

1. To provide approximately 200,000 emergency temporary housing units for veterans, in cooperation with educational institutions and local bodies, by relocating and converting surplus war housing and military structures for re-use.

Completion of 200,000 temporary units is one of the goals of the Veterans Emergency Housing Program. Title V of the Lanham Act, as amended by the Mead-Lanham Resolutions of December 1945 and March 1946, authorized appropriations of \$445,627,000 to pay the federal cost of the re-use program. Approximately 180,000 units are expected to be moved and remodeled at federal expense.

2. To provide federal aids for low-rent housing built before the War or deferred because of the War and to convert war housing under the United States Housing Act to low-rent status.

Before the outbreak of war interrupted construction of public low-rent housing, local housing authorities in 173 communities built 334 projects containing 105,600 units for low-income families formerly living in slum dwellings. Projects are financed with loans from the FPIIA or private investors, all loans are being repaid in full, with interest, in accordance with established amortization plans. To help keep rents within the means of low-income families, the FPHA makes an annual contribution, or subsidy, which for 1945 totalled \$7,414,000 or \$6.03 per dwelling unit per month. To December 31, 1945, federal subsidy payments totalled \$46,790,040; this represents the entire cost to the federal government since the beginning of the low-rent program. In addition, the local community is required to make an annual contribution equivalent to at least one-fifth of the federal contribution. This local contribution is made normally by exempting the projects from State and local taxes, as authorized by the United States Housing Act and State housing laws.

When the war began, only half of the program authorized under the United States Housing Act had been completed. Units under construction at that time were completed with the aid of priorities to house lower-income war workers and, after V-J Day, were turned back to full low-rent use. Additional war housing projects were built under Public Law 671, which authorized the use of low-rent housing funds for war housing construction. Early in 1946, after a Presidential finding that they were no longer needed to serve war needs, some 33,000 units in P.L. 671 projects were converted to low-

rent status. Altogether, low-rent housing funds had provided 62,000 units for war workers. Some 21,000 low-rent units scheduled in areas not requiring more war housing were deferred, pending availability of building labor and materials. As of November 1, 1946, the total housing built or authorized under the United States Housing Act comprised 193,643 dwellings in 747 projects.

3. To manage public war housing during the period of reconversion and demobilization for distressed families of veterans and servicemen, for certain civilian employees of the War and Navy Departments and of private industries completing war contracts, and for distressed families dislocated as a result of the war or demobilization.

The major wartime function of FPHA was to provide publicly financed housing for in-migrant war workers and their families; the FPHA was responsible for the construction and management of about four-fifths of the total provided. The remainder was provided by other agencies, principally the War and Navy Departments and the United States Maritime Commission. For the total public war housing program, some \$2,500,000,000 was made available, all from congressional appropriations or loan authorizations except \$29,000,000 expended by the New York State Division of Housing.

From these funds some 856,000 accommodations were provided for in-migrant war workers and their families. All but 16,000 of these units had been completed by December 31, 1945. The war housing completed includes 590,000 family dwelling units, 169,000 dormitory units, and 81,000 trailers, portable shelters, and other forms of stop-gap housing. These figures include accommodations made available by re-use of trailers and temporary or demountable units that were moved from one location to another.

In addition to veterans accommodated by the relocation of surplus facilities, on November 1, 1946, 272,000 veterans' and servicemen's families were living in public housing remaining at its wartime location. Such families accounted for over 44 percent of all occupied war and low-rent housing units in programs administered by the FPIIA.

4. To dispose of federally-owned housing surplus to the above needs.

The FPHA on November 1 had some 523,000 units completed or under construction contract to dispose of when surplus to veterans' and other demobilization needs. These include: 244,000 temporary units, which must be removed within 2 years after the emergency; 184,000 permanent units, including 113,000 of standard construction, and 71,000 demountables which may be dismantled and re-erected at new locations; 14,000 permanent family units, built with U.S. Housing Act funds and presently used as war housing, to be turned over to the use of low-income families; 35,000 trailers; and 46,000 family and dormitory units converted from existing structures.

Other FPHA housing includes: (a) 50 projects built by PWA and operated as low-rent housing, (b) 30 subsistence homesteads projects, which were transferred from Farm Security Administration and are being disposed of; (c) Three Greenbelt towns which were transferred to FPHA in 1942 for management and eventual disposition; and (d) seven limited-dividend projects constructed by private corporations with the aid of government loans. Mortgages on four have been sold, and the remaining three may also be sold.

JACK H. BRYAN.

**NATIONAL INVENTORS COUNCIL.** Created in August, 1940, by the Secretary of Commerce, the Council is a central clearing house for inventions and suggestions relating to the national security and welfare. Since its creation, more than 220,000 inventions have been carefully examined and evaluated, a surprisingly large number of which have proved meritorious and useful.

Dr. Charles F. Kettering, President of the General Motors Research Corporation, is Chairman, and other members include eminent scientists, inventors, Government officials, and business men well versed in the application of new devices, all of whom serve without compensation. The Council staff is assisted by a group of competent engineers and technical experts—each a specialist in his own field—furnished by the Office of Technical Services of the Department of Commerce.

JOHN C. GREEN.

**NATIONAL LABOR RELATIONS BOARD (NLRB).** In the last fiscal year more cases were filed with the National Labor Relations Board than in any year since the Wagner Act was enacted in 1935. A total of 12,260 cases was brought to the Board's attention, an increase of 26 percent over the number filed in the previous year. However, since nearly half of these cases were docketed during the last four months of the fiscal period, the receipt of new cases was really 50 percent greater than for the comparable period in the previous year.

Of the 12,260 cases filed in the fiscal year, 8,445, or 69 percent, involved representation questions and 3,815, or 31 percent, charges of unfair labor practices. Although this proportion is not markedly divergent from last year's, 75 to 25 percent, it represents a noteworthy departure from a trend. Since 1941 the proportion of unfair labor practice cases to representation cases has steadily declined; last year's shift in proportion thus constitutes a break in an uninterrupted decline of five years' duration.

The Board is not concerned with disputes involving wages, hours or disagreements arising over terms or interpretations of contracts. Its work is clear-cut and restricted in scope: it is entrusted with the administration of the National Labor Relations Act which guarantees American workers the right to organize and bargain collectively. In passing it Congress sought to prevent strikes over the issues of union recognition and anti-union discrimination. By preventing such disturbances it sought to promote industrial peace and equality of bargaining power through encouragement of collective bargaining.

Thus, the functions of the three-man Board are two-fold: (1) it conducts elections to determine employee representatives for collective bargaining purposes; and (2) it remedies and eliminates those unfair practices by employers which discriminate against employees in any manner because of union membership or activity.

On July 1, 1945 the Board had on its docket 1,916 representation cases—i.e., cases concerned with petitions filed by employers or employees requesting Board investigation and determination of units and freely-chosen representatives for purposes of collective bargaining. With the filing of 8,445 new election cases, the Board's preoccupation with a total of 10,361 such cases reached an all-time high. During the year it closed 7,981 of these cases, leaving a balance of 2,380 on its docket July 1, 1946.

Most of the above cases were closed by Board-conducted elections or cross-checks of company payrolls with union authorization cards. The re-

maining cases closed were either withdrawn by the parties filing the petitions or dismissed by the Board for lack of merit.

During the year the Board conducted 5,589 elections in which 698,000 employees cast secret ballots for the organization of their choice. In 4,446 balloting, or nearly 83 percent of the polls held, an organization was selected by at least a majority of the employees and thereupon was certified by the Board as collective bargaining representative.

Only 1,163, or 20.8 percent, of the elections held during the year were ordered by the Board. The greater number of them, 3,685, or 66 percent, were held with the consent or agreed-upon stipulation of all parties. The remaining 163 polls were pre-hearing elections, the result of a new Board policy instituted in November 1945 to expedite the disposition of reconversion representation issues. This policy makes it possible for elections to be conducted in certain types of cases without awaiting a formal direction of election by the Board in Washington; any necessary hearing may be held after the conduct of the election.

Affiliates of the American Federation of Labor were successful in attaining majority designation in 2,004 polls, receiving 175,332 votes; unaffiliated unions scored in 484 instances and received 90,874 votes, and in the remaining 1,143 contests there were 168,965 ballots cast against union affiliation.

From July 1935 through June 30, 1946, the Board conducted nearly 30,000 elections and cross-checks. The importance of self-determination to the individual worker is demonstrated by the consistently high percentage of employees who actually cast ballots: Nearly 7,000,000 workers, or 83 percent of those eligible to vote, went to the polls and, by secret ballot, signified their choice of bargaining representative. About 84 percent marked their ballots in favor of a representative.

The Board carried over from its previous year 1,321 unfair labor practice cases. With the 3,815 new such charges filed during the year, the total to be handled was 5,136. Of these, 2,909 cases were closed in the fiscal period, leaving a balance of 2,227 unfair labor charges pending on its docket July 1, 1946.

The unfair labor practices which deny, abridge, or interfere with employees' right to bargain collectively are enumerated in Section 8 of the Act. In essence, employers are forbidden to:

- (1) interfere, restrain or coerce employees in their self-organizational rights;
- (2) dominate, interfere with, or support the formation or administration of any labor organization;
- (3) discriminate in any manner in regard to hire or tenure of employment in order to discourage or encourage membership in a union;
- (4) discriminate against an employee for filing charges or giving testimony under the Act; and
- (5) refuse to bargain collectively with the duly chosen representatives of employees.

As in the past, the most frequent allegation of unfair labor practice in such cases filed in the fiscal period involved discriminatory treatment because of union activity. This was alleged in 64 percent of such cases docketed. Next in frequency was the allegation of employer refusal or failure to bargain in good faith. This allegation was made in 32 percent of the charges filed.

Approximately 72 percent of the 2,909 unfair labor practice cases disposed of during the year were closed by withdrawal or dismissal. To remedy the unfair labor practices found to have been com-

mitted in the remaining 793 cases the Board obtained the reinstatement of 3,184 workers found to have been discriminatorily discharged. Another 384 employees were directed to be reinstated after strikes caused by unfair labor practices. Back pay amounting to \$899,297 was awarded to a total of 2,779 workers found to have suffered discrimination. Company-dominated unions were ordered disestablished in 51 cases. Notices of compliance with Board decisions and orders were directed to be posted in 529 cases. Employers were directed to bargain collectively with employee-designated representatives in 175 cases.

From July 1935 through June 30, 1946, the Board had ordered the reinstatement of over 300,000 workers, some with back pay. These back pay awards totalled nearly \$11,000,000. In all approximately 2,000 company unions have been disestablished. In 5,000 cases collective bargaining was ordered. In 7,200 cases notices of compliance with Board decisions were directed to be posted.

The Board's jurisdiction extends only to those industries engaged in or affecting interstate commerce. In its eleven years of operation approximately 90,000 cases have been filed by labor organizations, employers and individual workers of the continental United States, Alaska, Hawaii, and Puerto Rico. As was the experience in previous years, most of the cases docketed in the 1946 fiscal period involved manufacturing enterprises. A total of 9,227, or 75.3 percent of all those filed, concerned such companies. Mining, agriculture, forestry, and fishing plants were involved in 484 cases; construction, wholesale and retail trade, and insurance companies accounted for 1,061; the remaining 443 cases involved transportation, communication, and other public utilities.

While the Board has its headquarters in Washington, D.C., it maintains twenty-two Regional Offices, each responsible for servicing a particular area. The greatest number of cases brought to the Board's attention during 1946 originated in the New York area; the lowest number of cases was filed in Puerto Rico. With the exception of that office, there occurred an increase in the number of representation and complaint cases filed in all of the Regional Offices. The biggest increase over the previous year was noted in the Indianapolis and San Francisco offices, 103.4 and 62 percent respectively.

Decisions and orders of the Board are not self-enforceable. Either the company or the Board may appeal to the Circuit Court of Appeals. Beyond this, either party may appeal to the Supreme Court. Over 600 Board decisions have been litigated in the Federal courts since passage of the Act. In the Circuit Courts, 346 of these Board orders were enforced in full; 73 were set aside, and 167 modified. Of the 52 cases that reached the Supreme Court, Board orders were enforced in 48 cases; in only 2 cases were Board orders set aside.

The Board began its 1947 fiscal period with a back-log of 4,607 cases pending on its books, the greatest carry-over in the history of Board operations. Alongside this, a cut made in the Board's appropriation for the new fiscal year necessitated the discharge of 23 percent of the Board's personnel. The Board estimates that the current rate of intake of cases plus the immensity of the back-log, aggravated by the reduction in personnel, may mean the doubling of the amount of time normally required to process cases. Meanwhile, until Congress has had an opportunity to consider the Board's request for appropriate fiscal relief so that it can perform its statutory duties promptly and

efficiently, the Board publicly expressed the hope that labor organizations would be patient and not return to the self-help of strikes which the Act was designed to discourage.

LOUIS G. SILVERBERG.

**NATIONAL MEDIATION BOARD (NMB).** A nonpartisan independent Board of the U.S. Government, created by amendment of the Railway Labor Act in 1934, whose duty is to mediate differences between the railroads, the express and Pullman companies, and the airlines on the one hand and their employees on the other. Chairman: Frank P. Douglass.

**NATIONAL PARKS AND MONUMENTS.** Record-breaking travel highlighted National Park Service activity during 1946. More than twenty-one and a half million visitors were recorded at national parks, national monuments, and other areas which make up the 21,081,875-acre National Park System. This travel exceeded by approximately 600,000 the number of visitors during the previous record travel year of 1941, the last before the outbreak of World War II.

National Park Service personnel charged with the administration, maintenance, and protection of these areas for the benefit and enjoyment of the public were faced with the problem of reconverting from a wartime to a peacetime basis, a problem intensified by shortages of supplies and labor. This reconversion problem also beset the concessioners who, under contract with the Federal Government, operate such facilities as hotels, lodges, and transportation lines. In some areas visitors who had not made advance reservations for stopovers during weekend and holiday periods were unable to obtain accommodations. In a few national parks the stay of visitors had to be limited. But there were few complaints. Visitors for the most part appeared to be grateful for the opportunity to see and enjoy these great places of nature and human history.

One unit—Adams Mansion National Historic Site, Quincy, Massachusetts—was added to the National Park System in 1946. Touro Synagogue in Newport, Rhode Island, also was designated as a National Historic Site, but being privately owned it is not administered as a unit of the National Park System.

Legislation enacted by Congress in July 1946, abolished Santa Rosa Island National Monument, Florida, a unit of the National Park System since 1939, and provided for the transfer of its land to Escambia County for local recreational purposes. Congress also enacted legislation changing the designation of Custer Battlefield National Cemetery to that of a national monument.

Units of the National Park System at the close of 1946 totalled 169, classified as follows: 27 national parks, 4 national historical parks, 85 national monuments, 11 national military parks, 1 national battlefield park, 7 national battlefield sites, 11 national historic sites, 9 national memorials, 10 national cemeteries, 3 national parkways, and the system of National Capital Parks.

On April 12, 1946, first anniversary of the death of President Franklin Delano Roosevelt, ceremonies dedicating the Home of Franklin D. Roosevelt National Historic Site, Hyde Park, New York, which is Federally owned, were held at the Site, with President Harry S. Truman, Mrs. Franklin D. Roosevelt, Secretary of the Interior J. A. Krug, and other notables in attendance. Three other units of the National Park System also dedicated in 1946—which, incidentally, was the thirtieth anniversary year of the establishment of the National Park

Service by act of Congress—were Olympic National Park in Washington, dedicated on June 15, and Isle Royale National Park in Michigan, and Mammoth Cave National Park in Kentucky, dedicated on August 27 and September 18, respectively.

During 1946 lands in 8 recreational demonstration areas administered by the National Park Service were turned over to the States or disposed of in some other manner. In addition part of another area was added to Wind Cave National Park, South Dakota, more than doubling the size of that park. Disposition of these recreational demonstration area lands was provided for by act of Congress of June 6, 1942. More than a decade ago 46 such areas were acquired by the Federal Government primarily for the purpose of retiring submarginal agricultural lands and demonstrating to local communities their value when developed for recreational purposes. Six of these areas now remain, and the lands therein will be turned over to the States or other agencies as soon as arrangements can be made for such transfers.

One of the major developments of the year was the appointment by Secretary of the Interior J. A. Krug of a group of consultants to make a thorough study of concession policies and practices throughout the National Park System and make recommendations for their improvement. In the group are representatives of the hotel, touring, accounting, and conservation fields. Appointment of another consultant representing the traveling public is planned. For the most part, visitor facilities, such as hotels, lodges, stores, and transportation lines in National Park Service areas are owned and operated by concessioners who are under contract with the Federal Government, a system which had its beginning in the act of Congress establishing Yellowstone National Park in 1872

NEWTON B. DRURY.

**NATIONAL WAGE STABILIZATION BOARD** The National Wage Stabilization Board succeeded, on December 31, 1945, to the wage stabilization functions of the National War Labor Board. Like its predecessor, the Wage Board was a tripartite agency, consisting of two representatives of industry, two of labor, and two of the public.

The program administered by the Wage Stabilization Board did not include, as had the wartime program, any participation in the settlement of wage disputes. Nor did it include, except in the Building and Construction Industry, any limitations upon the right to put into effect any wage increases which might be agreed upon in collective bargaining, or made voluntarily by an employer.

The basic provision of reconversion wage controls was that wage increases, although they could be made without government approval, could be used as a basis for seeking an increase in price ceilings only to the extent they were approved by the Wage Stabilization Board. Similar rules covered wage increases which would result in increased costs to the United States Government on cost-plus contracts. Reconversion wage controls were in general, therefore, "indirect" controls, and were really an adjunct of the price control program.

The standards used to determine the approvability of wage increases for price relief purposes were established by executive order of the President, under the Stabilization Act. In general, these standards provided for the approval of wage increases found necessary to eliminate "substandards," to match increases in the cost of living, or to remove "gross inequities." The Board approved, under the substandards provision, any increases

which brought wage rates to no more than sixty-five cents an hour. Increases were approved under the cost-of-living standard so long as they did not result in wage rates more than 33 percent above the January 1, 1941, levels. This percentage represented the rise in the cost of living between the base date and September 1945. The gross inequities standard provided for the approval of increases necessary to bring wage rates, or increases during the reconversion period, into line with those in related plants or industries.

The Board also administered the statutory provision prohibiting the making of any wage decreases except upon the showing of special circumstances set out in the Act of 1942.

The provisions of the Stabilization Act and the orders and regulations which were issued under it provided for the assessment of penalties where wage adjustments were made in violation of the substandard provisions. The principal sanction was in the form of a provision that wages found to have been paid in violation of the Act should be recommended to the Treasury Department for disallowance as business expense deductions on the income tax. During the reconversion period, and after the general substitution of "indirect" for "direct" wartime controls, these sanctions were imposed only with respect to unlawful increases in the Building and Construction Industry (where direct controls were retained) and in the case of the wage reductions.

The Board handled between 1,000 and 1,500 cases a week. Most of these were handled in one of the 12 regional boards which had been established, originally as part of the War Labor Board organization, throughout the country. These regional boards were also tripartite in nature. They carried the bulk of the Board's administrative responsibility. The control of wages in the Building and Construction Industry was carried out by the Wage Adjustment Board, which was composed of representatives of the AFL Building Trades Department, the leading industry trade associations, and representatives of the public appointed by the Secretary of Labor.

The general program administered by the Board was, throughout the course of its operations, a "tapering off" program. As prices were decontrolled in a particular industry, wage decontrols followed automatically. The program was one of planned withdrawal from the field of government controls as the peacetime production processes were restored to the point where controls became unnecessary.

The administration of this program was not unattended by substantial difficulties, most of them inherent in any program of even planned withdrawal and retreat. There developed, cumulatively, difficulties as to whether the withdrawal of controls was proceeding too rapidly or too slowly. The virtual emasculation of the price control program by the Congress in July 1946, rendered exceedingly difficult the continued administration of the wage program. The sharp upturn in the cost of living which followed the legislative action resulted in almost overpowering demands for a relaxation of the wage approval standards and for the removal of even the indirect wage controls.

These difficulties reached a peak in connection with the Board's handling of the Maritime case in September 1946 and with the even more rapid speeding up of price decontrols in the following month. The Maritime case resulted finally in an overruling of the Board's decision by the Director of Economic Stabilization. The meat and other

price decontrols in October meant the lifting of the related wage controls in all of the industries affected. The program of the Board entered the liquidation stage at this point.

It seems a fair appraisal of the Board's work that, without interfering with production or collective bargaining, it contributed very substantially to the resistance to inflationary pressures during the critical early reconversion period.

W. WILLARD WIRTZ.

**NATIONAL WAR FUND.** The War Fund was organized in 1943 as a federation of the leading war-related appeals, with the exception of the Red Cross, for providing comforts, hospitality and entertainment for our armed forces and merchant marine, recreational and educational materials for prisoners of war, and supplementary emergency war relief to the people of our Allies and to war-time refugees from Axis oppression.

The War Fund's joint appeal was presented to the American public through community war funds and war chests, linked in Community Chest cities with campaigns for established local services for health and welfare. Forty-three thousand individual soliciting committees in cities, towns and townships took active part in raising funds for the federated appeal.

The National War Fund was a voluntary war agency. Although not government-controlled or financed, it was government-endorsed, and it operated in accord with the President's War Relief Control Board.

**Member Agencies:** USO (United Service Organizations), United Seamen's Service, War Prisoners Aid, Philippine War Relief (of the United States), Belgian War Relief Society, United Service for China, American Relief for Czechoslovakia, American Aid to France, Greek War Relief Association, American Relief for Holland, American Relief for Italy, United Lithuanian Relief Fund, Friends of Luxembourg, American Relief for Norway, American Relief for Poland, United Yugoslav Relief Fund, American Field Service, Refugee Relief Trustees, U.S. Committee for the Care of European Children.

**Officers:** President, Winthrop W. Aldrich; Secretary, Ralph Hayes; Treasurer, Gordon S. Rent-schler; Vice-presidents, Jean B. Adoue, Jr., Prescott S. Bush, Robert M. Hanes, Francis P. Matthews, Walter Rothschild, Edward L. Ryerson, Robert G. Sproul, and Henry M. Wriston; Chairman of Budget Committee, Gerard Swope; Chairman, Public Relations, Thomas D'Arcy Brophy, General Manager, Harold J. Seymour. Headquarters: 46 Cedar Street, New York 5, New York.

**NAVAL PROGRESS. Research.** With the collapse of the German Reich, a Naval technical mission composed of several hundred technical investigators, scientists, engineers, and technicians was sent to Europe to study German scientific and engineering developments. One missile studied by the group was a radio-controlled glide bomb equipped with a television camera capable of reporting its progress to a television receiver on board a control plane. Another was an underwater bomb that continued on its path to the target after reaching the water and submerging. Another weapon, an electrically guided anti-aircraft missile, maintained contact with the firing plane at all times in flight by means of a thin, strong wire. It was steered by electrical impulses to opposing aircraft.

In addition to specific knowledge gained in the studies connected with this mission, Assistant Sec-

retary of the Navy H. Struve Hensel made an observation on the best method of achieving scientific progress: "There is an important lesson to be learned from a survey of German research. Results in general do not come quickly. Years of effort are usually necessary to produce a single new weapon."

The Office of Research and Invention, established in May, 1945 (renamed, late in 1946, Office of Naval Research), was the agency charged by the Navy with the responsibility of promoting research not only for immediate requirements but as a means of holding scientific supremacy in weapons and facilities of the future. The prospect of harnessing atomic energy to drive ships as well as gas turbine propulsion for ships, became a matter of interest. The latter was unveiled in a showing at the Naval Engineering Experimental Station, Annapolis, Maryland. To keep abreast of missile experimentation, the Navy program called for extensive research in supersonic aerodynamics. Several of the best German supersonic wind tunnels were dismantled and brought to the United States for experimentation, and with them came German scientists with knowledge to reinforce our own. One item, the world's largest device for measuring air density by optical means, has previously never been duplicated outside of Germany. To prepare for airplanes that travel faster than sound, an ejection cockpit that is sprung free of the plane, thus carrying the pilot to safety in case of emergency, has already been developed.

Turning to the man and his capabilities in the face of revolutionary conditions of speed and performance, a giant centrifuge, capable of simulating various physical stresses placed upon the high speed traveler, is under construction for experimental purposes. A new instructional procedure, preparing men on the ground to perform efficiently in the air, is in operation in the Navy's Special Devices Center, under the cognizance of ONR. Operating conditions of flight are simulated realistically, and men are charged with making proper responses without danger of sudden death or loss of expensive equipment.

**Field Research.** The laboratory cannot serve as a complete substitute for the field, however, and the Navy in 1946 took part in several important expeditions seeking the answer to what the future might bring in material and construction changes.

Tests Able and Baker of Operation Crossroads resulted in a voluminous mass of information which, when evaluated, will point the way to changes in design and construction of ship superstructures, as well as of hull design and interior fittings. The effects of radiation are likewise under medical study for protection of personnel. See BIKINI TESTS, MILITARY PROGRESS.

To keep abreast of a new age of strategy, the air age, the 45,000 ton U.S.S. *Midway* steamed in convoy with three destroyers and a tanker into the below zero Arctic Labrador Sea area on a test of carrier-air operations and cold weather equipment in March. In July Captain Richard H. Cruzen led a five ship group through the Labrador Sea and into Baffin Bay via Davis Strait. This training mission was itself a prelude to the year's-end sailing of a 12-ship expedition commanded by Rear Admiral Richard E. Byrd into Antarctica. The announced purpose: training, testing equipment, developing techniques for operating bases under arctic conditions. One result already apparent: carrier-air operations can effectively extend to subarctic regions in defiance of ice, snow, and frigid winds.

**Demobilization.** While career Navy personnel were looking to the future with research, the return of war veterans high on points for release back to civilian life was taking place. Ships of the Naval Transportation Service, augmented by combatant and auxiliary vessels, achieved one of the great mass movements of history. In spite of 100 ft. waves and 80 mi. per hr. winds, the *Saratoga*, the *Lake Champlain*, the *Yorktown*—illustrious carrier names—carried up to 4,000 passengers per trip on a shuttle service back to the States. The *Nevada*, the *Arkansas*, and other battleships carried 1,000 plus each trip. And so on, until more than 2,200,000 persons, including Army, Navy, Marine, and Coast Guardsmen, with additional civilian workers and prisoners of war, came in from the far Pacific. Another 122,178 were flown in by the Naval Air Transport Service. In the Atlantic, an additional 96,000 landed, leaving behind them the last big hurdle on the way to the separation centers.

By early September, 29 separation centers for Navy personnel alone had been shut down, with separatees totaling 3,070,581 of an original total on duty on V-J day of 3,400,000. Those remaining on duty were, with only rare exceptions, men who had asked retention of their own free choice. As of January 1, 1946, the Coast Guard reverted to its status as part of the Treasury Department.

Admiral Chester Nimitz, writing for *All Hands*, the Bureau of Naval Personnel Information Bulletin, said in February: "At the present moment, less than five months after the defeat of Japan, your Navy has not the strength in ships and personnel to carry on a major military operation."

With the cutback in personnel, immobilization of ships became a necessity. On the East Coast, the 16th Fleet began to accumulate in permanent berthing areas. The Ready Reserve Fleet, set up to include 73 major combatant ships and six auxiliaries, was to be assigned to training duty. The Laid-Up Reserve, scientifically dehumidified and preserved in fighting trim for prompt recovery in case of emergency, would total 651 major combatant types, including 18 aircraft carriers, 62 escort carriers, 7 battleships, 31 cruisers, 178 destroyers, 254 destroyer escorts, and 101 submarines. By Navy Day, 27 October, the task of putting this inactive fleet into its peacetime state was 55 to 60 percent completed in 15 berthing areas. At the same time, more than 1,456 merchant marine ships had been put into anchorages in temporary reserve.

**Personnel.** By year's end the personnel picture had brightened again, with enlistments making the draft unnecessary and applications from Reservists for permanent commissions bulging well beyond the totals in complement authorized by Congress. Looking forward to an age of highly developed mechanical complexities and accelerated scientific progress, the Navy unveiled its newest Reserve Officers' Training Program, the Holloway plan. Devised by a board of naval officers and civilian college presidents, and utilizing the nation's colleges and universities to supplement Naval Academy facilities, the plan provides for a four year college education, tuition, books, and fees as well as monthly retainer pay to successful candidates.

The Naval Reserve Officer Training Program, paying fifty dollars per month plus normal education expenses, has been established at 52 specific colleges and universities, and augments book and laboratory instruction with summer cruisers.

The Naval Aviation College Program, with similar financing, allows two years of college education at an accredited college or university of the candidate's choice, followed by two years of flight training as a midshipman, and then a return to college for completion of the last two years of undergraduate study either on active duty pay or on retainer pay of one hundred dollars per month in addition to normal education expenses. Upon successful completion of these training programs, the graduates may become affiliated with either the regular Navy or the Naval Reserve, following stipulated lengths of active duty.

Ex-servicemen, too, have an opportunity to rejoin the Navy for inactive duty in the Naval Reserve. With a force of one million men contemplated for the postwar Organized and Volunteer Reserves, the Bureau of Personnel readied a training program that became effective July 1, 1946. Men of the Organized Reserve could attend drills, a term redefined to mean lectures and educational sessions rather than physical training programs, and take two weeks cruises with pay. Volunteer Reservists would have no demands on their time at all, but would be eligible for the two weeks cruises with pay upon application. Available also were correspondence courses and activities bulletins designed to keep them current on naval affairs. The Air Reserve put the latest in naval aircraft at the disposal of qualified Reservists, to keep them in flying readiness and give them full opportunity to practice navigation, formation flying, carrier landings, etc. Projected plans for 1947 on the east coast alone called for the training of 62,500 Reservists in a series of two weeks cruises.

**The Navy in Diplomacy.** To give point to the Navy's belief that as long as commerce used the sea lanes the fleet must be kept strong, and its admonition that the Reserve should be kept intact, it became evident in 1946 that the Navy was a vital part of the country's diplomatic framework. Into the troubled Mediterranean, for temporary duty with the 12th Fleet, went the new carrier *Franklin D. Roosevelt*. Secretary James Forrestal stressed the Navy's part in diplomacy in a public statement, and Fleet Admiral Nimitz stated, in an address before the Associated Press Managing Editors at Miami, Florida: "Sea power helps to implement foreign policy. Our foreign policy has two aims. One is the creation of and participation in an international authority capable of adjusting affairs between nations to keep the peace. The other is to safeguard the interests of the United States. Our sea power serves both the national and the international policy."

**Organization.** With the immediate emergency past, the war safely won, and the new problems of the postwar world looming large, Fleet Admiral Ernest J. King was relieved by Fleet Admiral Chester W. Nimitz in January, 1946 as Chief of Naval Operations. Entering 1947, the top command reporting to Admiral Nimitz was set up as follows: Admiral John H. Towers, Commander in Chief, Pacific Fleet, comprising Naval Forces Western Pacific (Admiral C. M. Cooke, Jr.); Naval Forces Japan (Vice Admiral R. M. Griffin); Pacific Reserve Fleet (Admiral Richard S. Edwards); and the First Task Fleet (Vice Admiral A. E. Montgomery). The Commander in Chief, Atlantic Fleet, Admiral Marc A. Mitscher in turn had under his cognizance Naval Forces Europe (Admiral R. L. Conolly); Naval Forces Germany (Rear Admiral R. E. Schuirmann); Atlantic Reserve Fleet (Admiral Thomas C. Kin-

kaid); and the Second Task Fleet (Vice Admiral W. H. P. Blandy). Task fleets were expected to conduct training exercises twice yearly.

The U.S. Naval appropriation 1945-1946 was \$24,116,411,084.

**Foreign Navies.** The return of peace saw the continuation of construction on ships already being built in some countries and the abandonment of construction on many blueprinted vessels in countries having powerful fleets. Great Britain stopped work on several ships under construction, among these ships were the *Gibraltar*, *Malta*, and *New Zealand* (large carriers), as well as two 33,000 ton ships of the *Ark Royal* class and four *Hermes* class destroyers. The French have resumed construction on the 8,000 ton cruiser *De Grasse* at Lorient, and in Australia building got underway in April, 1944 for a new cruiser Spain has embarked on a construction program that envisions twenty destroyers, eight sloops, seven minesweepers, and twelve coast guard vessels.

**Great Britain.** The *Malaya*, *Ramillies*, *Resolution*, and *Revenge* have been assigned to harbor duties. The *Warspite* has been scrapped, and British strength in capital ships is now ten units, including the *Vanguard*, according to Jane's *Fighting Ships*, issue 1944-1945. This source further indicates that the *Queen Elizabeth*, *Valiant*, *Nelson*, *Rodney*, and *Renown* will be used for training duty, leaving only five battleships for service in the Home and Mediterranean fleets. The appropriations 1946 estimated budget was £255,075,000.

**France.** The war cost half the effective strength of the fleet. The battleship *Jean Bart* is being completed and rearmed, and the aircraft carrier *Béarn* has been reclassified as a transport d'aviation. The *Dixmude* (ex H.M.S. *Biter*), an escort carrier, has been acquired. Allied nations provided the French with six destroyer escorts, six frigates, fifty motor minesweepers, and almost one hundred coastal craft, in addition to the French active duty strength of three battleships, nine cruisers, and various smaller craft.

**U.S.S.R.** Exact information on the state of the Navy is difficult to obtain, but recent acquisitions include the battleship *Arkangelsk* (ex H.M.S. *Royal Sovereign*) two cruisers (ex U.S.S. *Milwaukee* and ex German *Nürnberg*) and a collection of submarines, destroyers, subchasers, and motor minesweepers of German and Allied origin.

**Netherlands.** The escort aircraft carrier *Karel Doorman* (ex H.M.S. *Natrana*), four former British destroyers, and eight former Australian minesweepers have been acquired.

**Norway.** Numerous ships of British origin, including five fleet minesweepers have been added.

**Greece.** The Royal Hellenic Navy has acquired four British-built submarines, and the former H.M.S. *Tanatside*, renamed the *Adrias*.

**Denmark.** With most of her fleet scuttled to prevent its use by the Germans, Denmark is acquiring frigates, corvettes, and minesweepers.

**Sweden.** Two cruisers and one large destroyer of the *Uppland* class have been recently launched.

**Turkey.** Britain returned one destroyer, three submarines used by the Royal Navy during the war, in addition to Turkey's recently acquired H.M.S. *Cribi*.

**Canada.** In 1946, about 10,000 men were on duty, manning one light fleet aircraft carrier, two cruisers, fourteen destroyers, and many smaller ships.

**South America.** Brazil has added eight destroyer escorts, one transport, and sixteen submarine

chasers to its fleet, all from the United States Navy. Chili purchased three corvettes from Canada, and suffered the loss of the *Lautaro*, a training ship, through fire at sea.

CHARLES R. BELL.

**NAVY, U.S. Department of the.** A Department of the U.S. Government, established in 1798, which supervises and maintains a naval establishment in readiness for the performance of such duties as the President, who is Commander in Chief, may order. The principal divisions of the Department are as follows:

Executive Offices of the Secretary  
Office of the Chief of Naval Operations  
Bureau of Yards and Docks  
Bureau of Naval Personnel  
Bureau of Ordnance  
Bureau of Ships  
Bureau of Supplies and Accounts  
Bureau of Medicine and Surgery  
Bureau of Aeronautics  
Headquarters United States Marine Corps

For organization and activities of the U.S. Navy, see the article on NAVAL PROGRESS. Secretary of the Navy in 1946: James V. Forrestal.

**NECROLOGY.** The following is a list of notable persons who died during the year 1946.

**Alekhine, Alexander A.** (Moscow, Russia, November 1, 1892—Estoril, Portugal, March 24, 1946). *Russian-French*. Lawyer who was considered the greatest chess master of all time. He defeated Capablanca in 1927 and, as world champion, won eight tournaments. Author of *My Best Game of Chess*, etc.

**Allen, Sir Hugh** (England, 1869—Oxford, England, February 20, 1946). *British*. Professor of Music at Oxford University and president of the Royal College of Organists. Chairman of the music advisory committee of the British Broadcasting Corporation.

**Andrade, Antonio Carlos de** (Barbacina, Brazil, 1870—Rio de Janeiro, Brazil, January 2, 1946). *Brazilian*. Statesman. Served as acting president of Brazil in absence of Getulio Vargas. Friend of democracy and stressed bond with the United States.

**Antonescu, Ion** (Rumania, 1882—Bucharest, Rumania, June 1, 1946). *Rumanian*. Former dictator of Rumania. Executed for war crimes.

**Arlliss, George** (London, England, April 10, 1868—London, England, February 5, 1946). *British*. Actor of stage and screen; author. World-famous for screen impersonations of Disraeli, Wellington, Rothschild, Voltaire, etc.

**Arnold, Waldo Robert** (Kiel, Wisconsin, May 8, 1896—Milwaukee, Wisconsin, November 7, 1946). Editor. Managing editor of the *Milwaukee Journal* since 1938. He was chairman of the Managing Editors Association of The Associated Press. During the first World War he was a member of an intelligence unit.

**Arthur, Sir George Compton Archibald** (England, April 30, 1860—London, England, January 14, 1946). Biographer, soldier, baronet. Wrote biographies of King George V, Queen Mary, Field Marshal Lord Kitchener, and many others.

**Atwill, Lionel** (Croydon, England, March 1, 1885—Hollywood, California, April 22, 1946). *British*. Actor. Among his better known stage plays were *The Walls of Jericho*, *The Little Munster*, *Hedda Gabler*; and among his motion pictures were *Mystery of the Wax Museum*, *Nana*, *Firebird*, *Captain Blood*, and *Hound of the Baskervilles*. Famous for his portrayal of Ibsen roles in England. He started as an architect.

**Baird, John Logie** (Helensburgh, Scotland, 1888—Bexhill, England, June 14, 1946). *British*. Television expert. He invented the Televisor, which was the first instrument to transmit scenes by wire or wireless, and the Noctovisor, which enables one to see in the dark by invisible rays. He demonstrated television in color, in 1928, and stereoscopic television, in December, 1941. He was president of Baird Television, Ltd., and consulting technical adviser to Cable and Wireless, Ltd., since 1941.

**Baker, Sir Herbert** (Kent, England, 1862—Kent, England, February 8, 1946). *British*. Architect, whose work was distinguished by its geographical range. Did a series of buildings in South Africa and reconstructed Bank of England, his most important work. Published a memoir of Cecil Rhodes as well as his own memoirs, *Architecture and Personalities*. Awarded Royal Gold Medal for Architecture in 1927.

**Baker, Roy Stannard** (Lansing, Michigan, April 17, 1870—Amhurst, Massachusetts, July 12, 1946). Author and editor. Popular under pen name of "David Grayson." His

most notable work, *Woodrow Wilson—Life and Letters*, won for him the Pulitzer prize in biography, in 1940.

**Bankhead, John Hollis** (Lamar County, Alabama, July 8, 1872—Bethesda, Maryland, June 12, 1946). Democratic Senator from Maryland, from 1930 to his death, who was author of the Cotton Control Act and the Farm Tendency Bill. Lawyer for the power interests, president of the Bankhead Coal Company, from 1911 to 1925.

**Bankock, Sir Granville** (London, England, August 7, 1868—London, England, October 16, 1946). *British*. Composer, conductor, teacher, and leader in contemporary music. Emeritus professor of Music at Birmingham University, vice chairman of the Corporation of Trinity College of Music, London. Sir Granville was knighted in 1930. His compositions include music for the *Electra* (opera), *Sophocles*, *The Pierrot of the Minute*, and *The Sea-Woman* (opera).

**Barlett, Captain Robert A.** (Brigus, Newfoundland, August 15, 1875—New York, New York, August 27, 1946). Explorer. He was present at Peary's discovery of the North Pole and became an annual commuter to the Arctic. He found and rescued Donald B. Macmillan stranded in the Arctic, he escaped from the disastrous Vilhjalmur Stefansson expedition through the Bering Straits when the Canadian flagship, *Karluuk*, was crushed by ice, and he piloted the Stell-McCracken expedition which discovered mummies of Stone Age men on the Aleutian Islands. He became an American citizen in 1911 and was a superintendent of marine transportation during World War I.

**Barton, John** (Germantown, Pennsylvania, 1877—New York, New York, December 23, 1946). Actor. He played the leading role, of Jeter Lester, in *Tobacco Road*, for over nine years, to audiences of over five million people in some two thousand performances. For twenty-five of the forty-five years he was on the stage, he appeared with his wife, Ann Ashley, on the music-hall circuit. *Canal Boat Nat* was their best known act.

**Batesman, Harry** (Manchester, England, May 29, 1882—Utah, January 21, 1946). Researcher, author and chess player in international matches. Held professorships in three fields: mathematics, physics, and aeronautics. Author of many standard texts in higher mathematics. Did outstanding work with Albert Einstein and other leading scientists.

**Bates, Sir Percy Elly** (England, May 12, 1879—Neston, England, October 16, 1946). *British*. Chairman of Cunard Steamship Company, Ltd., since 1930, and became chairman of the Cunard White Star Lines in 1934. He strongly advocated the policy of weekly express service between Southampton and New York. He died of a heart attack the day he was to have sailed on the Queen Elizabeth, on her maiden voyage.

**Beard, Mary** (Dover, New Hampshire, November 14, 1876—New York, New York, December 4, 1946). Nurse and educator. Former associate director of the International Health Division of the Rockefeller Foundation and director of the American Red Cross Nursing Service, 1938-1944. She developed a program of fellowships for nurses in thirty-eight foreign countries and established grants for American nurses to go abroad. Author of *The Nurse in Public Health*.

**Beery, Noah, Sr.** (Western Missouri, 1884—Hollywood, California, April 1, 1946). Stage and screen actor. Noted for his portrayals of villains.

**Bell, James Carleton** (Mount Vernon, Ohio, December 11, 1872—Winter Park, Florida, February 27, 1946). Psychologist, educator, and professor emeritus of education at the City College of New York. Founded the *Journal of Educational Psychology* and organized the New York Society for the Experimental Study of Education.

**Benjamin, Patriarch** (Adramyion, Turkey, 1868—Istanbul, Turkey, February 18, 1946). *Turkish*. Patriarch of the Greek Orthodox Church. Largely responsible for healing the schism between the Greek Orthodox Church and its Bulgarian branch.

**Berl, Ernst** (Freudenthal, Austria, July 7, 1877—Pittsburgh, Pennsylvania, February 16, 1946). Explosives expert, research professor. His most important work was conversion of vegetation into fuel. During the war he was consultant for the United States Government. From 1933 to 1945 he was a research professor at the Carnegie Institute of Technology. Chief chemist for Austria-Hungary in first World War.

**Blomberg, Field Marshal Gen. Werner von** (Stargard, Poland, 1878—Nuremberg, Germany, March 13, 1946). *German*. One-time confidant of Hitler. Ousted as head of German High Command after marrying a "commoner". Represented Germany at the Disarmament Conference in Geneva.

**Bodolschwingh, Rev. Friedrich von** (Germany, 1877—Germany, January 8, 1946). *German*. Former Bishop who, with the Rev. Martin Niemöller, led the struggle for the freedom of the Protestant Church in Nazi Germany. Known as "the pastor of the poor". Directed Bethel Institute, long noted for its Christian charity work.

**Homma, Lieut. Gen. Masaharu** (Died: Los Banos, Philippine Islands, April 8, 1946). *Japanese*. Conqueror of Bataan and Corregidor. He was executed for ordering the "Death March" at Bataan and for condoning other atrocities in the Philippines.

**Hopkins, Harry Lloyd** (Sioux City, Iowa, August 17, 1890—New York, New York, January 29, 1946). Friend and advisor of President Roosevelt; adviser and assistant to President Truman until July, 1945. Secretary of Commerce from 1938 to 1940, in charge of the lend-lease program; as personal envoy of President Roosevelt, persuaded Premier Stalin to agree to freedom of discussion at the San Francisco Conference; laid the groundwork for the Potsdam Conference. Chairman of the Anglo-American Munitions Assignments Board. Made two missions during the war to Moscow and to London. Headed Works Progress Administration.

**Hutchison, Lieut. Col. Graham Seton** (Inverness, England, January 20, 1890—Buckinghamshire, England, April 8, 1946). *British*. Author, publicist, educator, and artist. Wrote a famous spy novel of World War I, *The W Plan*.

**Ingram, Rt. Rev. Arthur Foley Winnington** (Worcestershire, England, January 26, 1858—London, England, May 26, 1946). Bishop of London from 1901 to 1939. His many published books included *The Potter and the Clay*, *What a Layman Should Believe*, *Some World Problems*, and *The Secrets of Happiness*.

**James, Alexander** (Cambridge, Massachusetts, December 22, 1890—Dublin, New Hampshire, February 26, 1946). Portrait and landscape painter whose work is represented in the Metropolitan Museum of Art and other permanent American exhibitions.

**Jeans, Sir James Hopwood** (London, England, September 11, 1877—Surrey, England, September 17, 1946). *British*. Scientist, educator, and author. His most original work was done in the field of cosmogony where he showed the cause of spiral nebulae. He interpreted many new developments in science to the lay public in relativity, quantum theory, radio activity, atomic energy, and the transmutation of the elements. With his countryman and fellow astronomer, Sir Arthur Eddington, he preached the doctrine of the ultimate death of the universe. He was knighted in 1928 and received the Order of Merit in 1939.

**Johnson, Herbert** (Sutton, Nebraska, October 30, 1878—Philadelphia, Pennsylvania, December 4, 1946). Political cartoonist. From 1912 to 1941, he was a member of the staff of *The Saturday Evening Post*.

**Johnson, Walter** (Humbolt, Kansas, November 6, 1887—Washington, D.C., December 10, 1946). Professional baseball player and manager. "Big Barney" was with the Washington Senators, for twenty-one years. He pitched 113 shut-outs since 1907, struck out more batters than any other pitcher, and held forty-three other world records. He was one of the first five men to be named for baseball's Hall of Fame.

**Jones, Mabel Wagnalls** (Atchison, Kansas, April 20, 1871—New York, New York, March, 22, 1946). Pianist, author, editor, and philanthropist. In connection with the Wagnalls Memorial at Lithopolis, Ohio (see illustrations opposite page 641), she founded and endowed the first free school in America for the study of Esperanto. Author of *The Rosebush of a Thousand Years* (which was the original story for the motion picture, *Revelation*, in which Mme. Nazimova was featured), and other books and stories. Editor of *Letters to Lithopolis from O. Henry to Mabel Wagnalls* and the musical terms in the *Standard Dictionary*.

**Kains, Maurice Grenville** (Ontario, Canada, October 10, 1868—Suffern, New York, February 25, 1946). Horticulturist, author, and educator. Agriculture and botany editor of the *NEW INTERNATIONAL ENCYCLOPEDIA*. Former professor and head of the department of horticulture at Pennsylvania State College. Published twenty-seven books, one of which, *Five Acres and Independence*, was a best seller in 1935.

**Kalinin, Mikhail Ivanovich** (Verkhnyaya Troitsa, Russia, November 20, 1875—Moscow, U.S.S.R., June 3, 1946). President of the Soviet Union for twenty-seven years, until his retirement on March 19, 1946. He had been a leader in the revolution. Through his great popularity with the peasants, he was able to strengthen their belief in the policies of the Soviet government, especially the Five Year Plan.

**Kefauver, Grayson Neil Kirk** (Middletown, Maryland, August 31, 1900—Los Angeles, California, January 5, 1946). Educator and author. Dean of the School of Education at Stanford University, on leave. He had recently been appointed United States representative on the Preparatory Commission of the United Nations Educational, Scientific, and Cultural Organization.

Formerly president of the Royal Naval College at Greenwich, Vice Admiral commanding the Royal Naval War College, and Commander in Chief of the America and West Indies station.

**Keynes, Lord John Maynard** (Cambridge, England, June 5, 1883—Sussex, England, April 21, 1946). *British*. Economist, Parliamentary orator, and historian. Author of the controversial, *The Economic Consequences of the Peace*, and many other books. His place in economics was formally recognized in 1942 with publication of the King's Birthday Honors naming him first Baron of Tilton. He was vice president of the World Bank and Fund, principal representative of the Treasury and Deputy for the Chancellor of the Exchequer on the Supreme Economic Council after World War I.

**Keyserling, Count Hermann** (Koenna, Estonia, July 21, 1880—Innsbruck, Austria, April 26, 1946). *Estonian*. Writer and lecturer. His annual lecture tours included Italy, Spain, Portugal, France, Hungary, Rumania, Turkey, the United States, and most of the South American countries. Among his published works are *The Travel Diary of a Philosopher*, *The Recovery of Truth*, *Creative Understanding*, and *America Set Free*.

**Kingsbury, Edward Martin** (Grafton, Massachusetts, July 16, 1854—Crawford, New Jersey, January 28, 1946). Editorial writer for *The New York Times*, who received the 1925 Pulitzer Prize for his editorial "The House of a Hundred Sorrows" written for the *Times'* annual Hundred Neediest Cases appeal. His writings were anonymous, except for occasional book reviews.

**Kirschenbaum, Jacob** (Galicia, Poland, 1885—New York, New York, October 15, 1946). *Yiddish*. Writer and member of the staff of *The Jewish Morning Journal*, since 1915. During the first World War, coordinator, with the late Louis Marshall, on the Jewish Welfare Board's cultural and social activities. Author of *America the Land of Wonder*, published in Poland as a primer in American democracy for European Jewry and burned by the Nazis after their conquest of Poland.

**Kobrin, Leon** (Vitebsk, Russia, 1872—Brooklyn, New York, March 31, 1946). Dramatist, author, and journalist. Widely known to readers of Yiddish for his novels about immigrant Jews in American ghettos, and his plays produced on the Yiddish stage.

**Kutrzeba, Stanislaw** (Poland, 1878—Cracow, Poland, January 7, 1946). Polish Jurist, historian, and author. President of the Polish Academy of Science and professor of Polish law at the University of Cracow. He was a member of the commission that went to Moscow in June, 1945, for consultations which led to the establishment of the present Polish government.

**Lake, Kirsopp** (Southampton, England, April 17, 1872—South Pasadena, California, November 10, 1946). Archaeologist and historian who for twenty-three years was a professor of history at Harvard University. Directed several important archaeological expeditions, such as the expedition to the city of Van, and made periodic visits to Mount Sinai, Mount Athos, and other Biblical sites.

**Langevin, Paul** (France, 1872—Paris, France, December 19, 1946). French Educator, physicist, and adviser to the French Bureau of Atomic Energy. He was awarded the Nobel Prize and the Copley Medal for his work in the electronic theory of magnetism. He was president of the Société Française de Pédagogie and professor of general physics at the College of France.

**Leathers, Dr. Waller Smith** (Charlottesville, Virginia, December 4, 1874—Nashville, Tennessee, January 26, 1946). Emeritus dean of Vanderbilt University's School of Medicine. Formerly president of the National Board of Medical Examiners, the American Public Health Association, the Association of American Medical Colleges, and the Southern Medical Association.

**Leigh, Rear Admiral Richard Henry** (Panola County, Mississippi, August 12, 1870—Long Beach, California, February 4, 1946). Commander in chief of the United States Navy in 1932. In 1933, he became a member of the Navy's general board in Washington and, the following year, he went with the American delegation as naval adviser to the Disarmament Conference in London.

**Lewis, Gilbert N.** (Weymouth, Massachusetts, October 23, 1875—Berkeley, California, March 23, 1946). Chemical researcher and educator, who was dean of the College of Chemistry at the University of California. Developed valence theory of chemical reaction. Author of *Valence and the Structure of Atoms and Molecules*. Collaborated with Dr. Ernest O. Lawrence in inventing the cyclotron and, with Dr. Irving Langmuir, was co-author of the Lewis-Langmuir atomic theory. With Dr. Harold C. Urey, he discovered heavy water.

**Li Lieh-chun, General** (Kiangsi Province, China, 1883—Chungking, China, February 20, 1946). Veteran Chinese revolutionary leader and State Councilor of the National Government who played a leading role in the establishment of the Republic of China and was an early supporter of Dr. Sun Yat-sen. Member of the central executive committee of the Kuomintang.

**Little, Richard H.** (Leroy, Illinois, 1870—Richmond, Virginia, April 27, 1946). Columnist, who was author of the *Chicago Tribune's* "A Line O' Type or Two." Also, as a newspaper correspondent, he covered the Spanish-American War, Russo-Japanese War, World War I, and the Russian Revolution. Drama critic for the *Chicago Herald*. Previously he had practiced law.

**Lorenz, Dr. Adolf** (Silesia, Austria, April 21, 1854—Vienna, Austria, February 12, 1946). Austrian. Orthopedist, known as the "bloodless surgeon," who relieved orthopedic ailments by external manipulation rather than surgery. He was opposed by more conservative members of the medical profession. During a stay in New York City, he examined 2,203 cripples. He published his autobiography, *My Life and Work*, in 1936.

**Lumsden, Dr. Leslie L.** (Granite Springs, Virginia, June 14, 1875—New Orleans, Louisiana, November 8, 1946). Physician and pioneer in public rural sanitation. Officer of the United States Public Health Service for forty-one years. He had been professor of epidemiology at the Texas University School of Medicine in the first World War, he served as an Assistant Surgeon General.

**Maanen, Adriaan Van** (Sneek, Holland, March 31, 1884—Pasadena, California, January 26, 1946). Astronomer. Member of the staff at the Mount Wilson Observatory since 1912. He was well known among scientists for his studies of parallaxes and the proper motion of stars and nebulae, and the general magnetic field of the sun.

**McClung, Clarence Erwin** (Clayton, California, April 5, 1870—Swarthmore, Pennsylvania, January 17, 1946). Zoologist, educator, and author, who is known for his extensive studies on chromosomes, he explained the mechanism underlying Mendel's Law. Emeritus professor of Zoology at the University of Pennsylvania. Headed many scientific expeditions.

**Mackinnon, Sir Frank Douglas** (England, 1871—London, England, January 23, 1946). British. Lord Justice of Appeal since 1937. Formerly president of Johnson Society of Lichfield, chairman of the Association of Average Adjusters, president of Pegasus Club, chairman of Bucks Quarter Sessions, and president of Bucks Archaeological Society. Among his published works are *Annotations on*

*Lamb's Old Benchers of the Inner Temple, The Murder in the Temple, and Grand Larceny.*

**Matsuoka, Yosuke** (Yamaguchi, Japan, March 3, 1880—Tokyo, Japan, June 27, 1946). Japanese. Diplomat, who was educated in the United States, and spent seventeen years in the diplomatic service of Japan before joining the Seiyukai party and being elected to the Diet. President of the South Manchurian Railway, from 1935 to 1939, head of the Japanese delegation at the League of Nations, from 1932 to 1933, and became Foreign Minister of Japan in 1940. He signed a preliminary pact with Hitler, in February, 1941, by which the Japanese were to attack the United States. He died while on trial as a war criminal.

**Maxwell, George Hebard** (Sonoma, California, 1860—Phoenix, Arizona, December 1, 1946). Erosion expert and advocate of reclamation. Before 1900 he gave up the practice of law to campaign for the reclamation of land, and he became known as "the man who made the desert bloom." His efforts brought about the National Reclamation Act of 1902, the Newlands river regulation amendment to the River and Harbor Bill, passed in 1917; and the construction of the Roosevelt Dam. He wrote many books on reclamation, flood prevention, erosion control, and homecraft.

**Mechau, Frank A., Jr.** (Glenwood Springs, Colorado, January 26, 1904—Denver, Colorado, March 9, 1946). Artist and educator. He painted the murals in the Washington, D.C. postoffice, was director of art classes at Columbia University, and war artist-correspondent for *Life* magazine.

**Medalie, George Zirden** (New York, New York, November 21, 1883—Albany, New York, March 5, 1946). Associate judge of the court of appeals. Formerly United States attorney for the Southern District of New York, and a member of the Advisory Committee of the United States Supreme Court.

**Meek, Donald** (Glasgow, Scotland, July 14, 1880—Hollywood, California, November 18, 1946). Character actor and comedian of stage and screen. He appeared on the Broadway stage in *Going Up*, *Broken Dishes*, *Little Old New York*, and other plays. During his thirteen years on the screen he made more than one hundred films, portraying the timid "average man."

**Merivale, Philip** (Manickpur, India, November 2, 1886—Los Angeles, California, March 13, 1946). Internationally known stage and screen actor who made his American debut in Shaw's *Pygmalion*, in 1914. Best known for his portrayal of Prince Sirki, in *Death Takes a Holiday*. He starred in Maxwell Anderson's *Mary of Scotland* and many others.

**Michel, Dr. Carl** (Chicago, Illinois, 1891—Bethesda, Maryland, January 3, 1946). Physician. Chief medical officer of the U.S. Coast Guard and Assistant Surgeon General of the U.S. Public Health Service. Pioneer in the development of yellow fever quarantine methods. Effectively fought bubonic plague and yellow fever in Mexico in 1920.

**Mikhailovitch, Gen. Draja** (near Belgrade, Yugoslavia, 1893—Belgrade, Yugoslavia, July 17, 1946). Yugoslav. A Chetnik regimental colonel, who fled to the hills from the oncoming Germans, in April 1941, and organized a band of guerrillas whose exploits against the Germans won the acclaim and aid of King Peter, the British, and the United States. In spite of this, Marshal Tito's com-

munist-dominated government executed him for treason and collaboration with the Germans.

**Mossell, Rev. Mark** (Pittsburgh, Pennsylvania, 1854—Baltimore, Maryland, October 28, 1946) Oldest Passionist in the world. Ordained in Rome sixty-eight years ago, he became a member of the Congregation of the Passion seventy-six years ago and became famous for his mission work among southern Negroes.

**Moholy-Nagy, Ladislav** (Borsod, Hungary, 1895—Chicago, Illinois, November 24, 1946). *Hungarian-American*. Artist, educator, and writer. He came to the United States in 1937 to establish an American version of the Bauhaus, at Weimer, which taught that art could and should "come to terms with and eventually master a scientific and machine age." The achievements of the Chicago Institute of Design, under his leadership as director-president, have won the backing of the executives of such firms as United Air Lines, Container Corporation of America, Marshall Field and Company. His book, *The New Vision*, describes the work of the Bauhaus school.

**Morgenstern, Henry, Sr.** (Mannheim, Germany, April 26, 1856—New York, New York, November 25, 1946). Former ambassador to Turkey, lawyer, and real estate developer of notable achievements. President of Central Realty Bond and Trust Company, which he organized with other important companies handling many of New York City's best known properties. He was appointed, by Franklin D. Roosevelt, representative of the United States at a conference in Geneva.

**Moscicki, Ignacy** (Mierzanow, Russia, December 1, 1867—Versoix, Switzerland, October 2, 1946). *Russian-Polish*. Statesman, chemist, and educator. While President of the Polish Republic, from 1926 to 1939, he acted as administrator of the dictatorial policies of his friend, Marshal Joseph Pilsudski. Professor of Electrochemistry and Electrophysics in Switzerland and Poland. In 1916, he established the Polish Institute of Chemical Research in Lwów. He did extensive work in nitrates and he perfected more than 300 patents on processes and apparatus.

As chief of the war plans division of the War Department, from October, 1938 to December, 1940, he was responsible for preparing the country's defenses. From 1942 to February, 1944, he was assistant chief of staff in the Intelligence Division of the War Department.

**Summerville, George (Slim)** (Albuquerque, New Mexico, 1896—Laguna Beach, California, January 5, 1946). Screen comedian. Portrayed "thick" parts One of the original Keystone Cops of pioneer movie days. He won fame in *All Quiet on the Western Front*, and appeared in many other pictures including *Tobacco Road*, *Jesse James*, *Way Down East*, *The Farmer Takes a Wife*, and *Rebecca of Sunnybrook Farm*.

**Swettenham, Sir Frank Athelstone** (Derbyshire, England, 1850—London, England, June 11, 1946). British Resident-General of the Federated Malay States, 1896 to 1901; governor and commander in chief of the Straits Settlements, 1901 to 1904; Chairman of Royal Commission to enquire into the affairs of Mauritius, in 1909, joint director of the Official Press Bureau, 1915-19. His published books include *Malay-English Vocabulary*, *Malay Sketches*, and *British Malaya*.

**Talmadge, Eugene** (Forsyth, Georgia, September 23, 1884—Atlanta, Georgia, December 21, 1946). Politician and lawyer. He had been governor of Georgia from 1933 to 1937 and from 1940 to 1942. He was governor-elect of that state at the time of his death. His plan was "to restore white supremacy" in Georgia by opposing the Negro's right to vote, and other measures.

**Tarkington, Booth** (Indianapolis, Indiana, July 29, 1869—Indianapolis, Indiana, May 19, 1946). Novelist and playwright. Author of the *Penrod* books *The Magnificent Ambersons* and *Alice Adams*, which won him the Pulitzer Prize. Many of his writings were adapted to stage, screen, and radio.

**Taylor, Laurette (Cooney)** (New York, New York, April 1, 1884—New York, New York, December 7, 1946). Actress. For more than twenty-five years she appeared on the stage in the United States and England. She is best known for her roles as Peg, in *Peg O' My Heart*, and as the mother in *The Glass Menagerie*, which won for her a unanimous vote of the New York Drama Critics' Circle as the best performance of the season.

**Thorne, Will** (Birmingham, England, October 18, 1857—London, England, January 2, 1946). British Labor leader, who was a member of House of Commons for thirty-eight years. He founded National Union of General and Municipal Workers.

**Tilzer, Harry von** (Goshen, Indiana, 1873—New York, New York, January 10, 1946). One of the most popular and prolific writers of the music hall era, whose songs included *Wait Till the Sun Shines, Nellie* and *A Bird in a Gilded Cage*. Composed about 8,000 songs, 2,000 of which were published. He helped originate phrase "Tin Pan Alley."

**Trimble, South** (Hazel Green, Kentucky, April 13, 1864—Washington, D.C., November 23, 1946). Politician. He was Clerk of the House of Representatives for twenty-five years, from 1911 to 1918 and from 1930 to 1946. Previously he had served three terms in the House of Representatives and had been Speaker in the House of Representatives of Kentucky.

**Trixier, Adrien Pierre** (Limoges, France, 1891—Paris, France, February 18, 1946). French Labor leader and statesman. Interior Minister in two De Gaulle governments, he had also been Minister of Labor and Social Questions in the Provisional Government of the French Republic; commissioner of labor and social affairs for

the French Committee of National Liberation, in Algiers; chief of the Free French delegation to the United States, assistant director of International Labor Organization.

**Tyler, George Crouse** (Circleville, Ohio, April 13, 1867—Yonkers, New York, March 13, 1946). Theatrical producer, who managed 350 stage productions during his forty-year career. Brought the Irish Players from the Abbey Theater to the United States. Introduced Booth Tarkington as a dramatist by producing his play *Gentleman from Indiana*.

**Ubico, Gen. Jorge** (Guatemala City, Guatemala, November 10, 1878—New Orleans, Louisiana, June 14, 1946). Guatemalan. From 1931 to 1944 he was president of Guatemala. He resigned and fled to the United States because of political unrest blamed on "Nazi-Fascist agitation." He was in the service of his country from the age of sixteen as an army officer, relief worker, and politician.

**Valentine, Lewis Joseph** (Brooklyn, New York, March 19, 1882—Brooklyn, New York, December 16, 1946). Police Commissioner of New York City, from 1934 to 1945, who did outstanding work. He helped organize the Japanese and Korean police, fire, and prison systems for Gen. MacArthur. More recently he was chief investigator for the Election Frauds Bureau of the New York State Attorney General's office.

**Vanamee, Grace Davis** (North Adams, Massachusetts, September 15, 1876—St. Petersburg, Florida, December 10, 1946). Suffragist, lecturer, writer, and educator. She was one of the founders of Women's National Republican Club in New York; chairman of the Republican Women's State Speakers; and president of the Henry Hladley Foundation.

**Vickery, Vice Admiral Howard L.** (Bellevue, Ohio, April 20, 1892—Palm Springs, California, March 21, 1946). Vice chairman of the United States Maritime Commission in World War II. Called "miracle man" of the war. In 1940, when Britain asked American shipyards to build her freighters, Admiral Vickery engaged Henry J. Kaiser to expedite the program.

**Villarreal, Lt. Col. Gualberto** (See article on BOLIVIA)

**Waesche, Admiral Russell Randolph** (Thurmont, Maryland, January 6, 1886—Bethesda, Maryland, October 17, 1946). The Coast Guard's first full admiral under whom the Coast Guard increased from 15,000 to 170,000. He was commandant of the Coast Guard from 1936, until he retired, in 1945, after which he was named by President Truman as one of the elder statesmen's organization for national defense, which consisted of the ten top-ranking wartime leaders. He was decorated, by Secretary of the Navy Forrestal, with the Distinguished Service Medal.

**Wagnalls, Mabel.** See *Jones, Mabel Wagnalls*.

**Walch, Johannes Lodwijk** (The Netherlands, 1879—Amsterdam, The Netherlands, December 12, 1946). Dutch. Playwright, author, and critic. Director of the Amsterdam School of Dramatic Arts. Formerly professor of Netherlands literature at the Sorbonne in Paris and president of the Society of Netherlands Literature. His produced plays included *Judas Iscariot*, *Antithese*, *The Supreme Law*, and *The Magic Seal*.

**Walker, James John** (New York, New York, June 19, 1881—New York, New York, December 18, 1946). Tammany politician and song writer; called "typical New Yorker." Mayor of New York City, from 1926 until his sudden resignation, September 1, 1932, while under charges which resulted from the investigation ordered by the state Legislature. President of Majestic Records Company, until his death. Author of song hit, *Will You Love Me in December as You Did in May?*

**Wells, Gabriel** (Balassa-Gyarmet, Hungary, January 24, 1861—New York, New York, November 6, 1946). Hungarian-American. Dealer in rare books and manuscripts, benefactor. He gained an international reputation as buyer and seller of rare books and manuscripts; put Henry Sotheran and Company, second oldest book firm in England, on sound financial basis when it was threatened with dissolution, and saved, for France, the house in which Balzac had written some of his works. He bound and sold the separate leaves of a defective Gutenberg Bible with an essay by the late Edward A. Newton.

**Wells, Herbert George** (Kent, England, September 21, 1866—London, England, August 13, 1946). British. Author and lecturer. His literary works often made use of modern scientific developments and their possible effect upon the future, though he also included sociological, historical, and humorous writings. In 1914, he predicted the atomic bomb, in his novel *The World Set Free*. *The Outline of History* is his most important work of non-fiction. *Kypps* is regarded as his finest book. Others were *The Invisible Man*, *The War of the Worlds*, *Tono-Bungay*, and *History of Mr. Polly*. He fought for political, social, and military reforms.

**Whitaker, Col. John Thompson** (Chattanooga, Tennessee, January 25, 1906—Washington, D.C., September 11, 1946). Journalist and author. As a war correspondent for The Chicago Daily News and The Washington Star, he covered the Ethiopian War and the Spanish Rebellion. For The Chicago Daily News, he later covered South America. He served in the Office of Strategic Services, from 1942 to 1945. He was the author of *We Cannot*

*Escape History, And Fear Came, and Americas to the South.*

**White, Stewart Edward** (Grand Rapids, Michigan, March 12, 1873—Berkeley, California, September 18, 1946). Adventurer, author, and authority on birds. In 1913, he mapped German East Africa. His *The Blazed Trail* was a best seller, though his semi-historic works such as *The Gray Dawn* and *The Long Rifle* are considered better literature. He also wrote *Wild Geese Calling*, *Old California*, *Anchors to Windward*, *The Stars Are Still There*, among others.

**Whitman, Rear Admiral Ralph** (Boston, Massachusetts, April 7, 1880—Danbury, Connecticut, February 8, 1946). Naval officer and civil engineer. Former public works officer of the Third Naval District. At one time member of Isthmian Canal Commission and technical adviser to the military governor of Santo Domingo.

**Williams, Valentine** (October 20, 1883—New York, New York, November 20, 1946). *British*. Journalist and author. From 1904 to 1909 he was a Reuter's correspondent in Berlin; then, as Paris correspondent for The London Daily Mail, he covered the Portuguese Revolution of 1910 and the Balkan War of 1913. During World War I he was a captain in the Irish Guards. Then at the advice of John Buchan he started writing his successful mystery novels, the first of which was *The Man with the Clubfoot*. Others were *The Secret Hand*, *The Clock Ticks On*, *The Spider's Touch*, and *The For Prowls*.

**Wilson, Hugh Robert** (Evanston, Illinois, January 29, 1885—Bennington, Vermont, December 28, 1946). Diplomat. During his thirty-year career as a United States diplomat he was ambassador to Germany and minister to Switzerland; delegate to many of the League of Nations' disarmament conferences and to the London Naval Conference (of 1930). He also served the United States in Buenos Aires, Vienna, Berne, Tokyo, Lisbon, Havana, and Brussels. In 1937, he was Assistant Secretary of State. He negotiated a new financial treaty with the Dominican Republic. His autobiography was written in two sections: *The Education of a Diplomat and Diplomat Between Wars*.

**Wright, Frederick A.** (Suffolk, England, February 16, 1869—England, August 2, 1946). *British*. Professor of Classics, University of London. Responsible for revised edition of *Lemprière's Dictionary*. Author of *Girdle of Aphrodite*, *The Romance Life in the Ancient World*, *Alexander the Great*, and other important works in the classical field.

**Yamashita, Lieut. Gen. Tomoyuki** (Shikoku, Japan, 1885—Los Banos, Philippine Islands, February 23, 1946). *Japanese*. He was hanged as a war criminal, for having condoned atrocities while he held the position of Commander of the Japanese Army in the Philippine Islands. He had successfully defeated the British at the start of World War II, in Malaya and Singapore.

**Yoldi, Gen. Luis M. Orgaz** (Born in Spain—Madrid, Spain, January 31, 1946). *Spanish*. Army leader and Chief of the General Staff of the Spanish Army. Supporter of Monarchist cause, mentioned as leader of rumored transitory government junta. In 1943 signed a petition of generals, asking Franco to restore the monarchy. Fought on the Nationalist side during the Civil War.

**Youmans, Vincent** (New York, New York, September 27, 1898—Denver, Colorado, April 5, 1946). Song composer and producer of light opera and the musical comedy, *No, No Nannette*. He composed *Tea for Two*, *Hallelujah, I Want to be Happy*, and the score for the motion picture, *Flying Down to Rio*.

**Young, James Barclay** (Washington, D.C., February 14, 1883—Stonington, Connecticut, November 16, 1946). Consular official and diplomat for thirty-four years. During the twelve months from July, 1916, until July, 1917, while consul at Fiume, he represented the British, French, Italian, Serbian, Russian, Rumanian, Japanese, Belgian, Montenegrin, and San Marino diplomatic interests.

**Zaghoul, Safia** (Born in Egypt—Cairo, Egypt, Jan. 12, 1946). Widow of said Zaghoul Pasha, Egypt's greatest modern Nationalist leader. Known as "mother of the Egyptians," willed her home "The House of the Nation" to the government as a museum and natural shrine.

**NEGROES.** The 13,000,000 Negroes of the United States are but a fraction of the earth's 250,000,000 black folk. These Negroids, no more and no less than the Caucasoids and Mongoloids, do not constitute a single nationality, language, or culture. They are citizens and subjects of many nations and empires; they speak French, Bantu, English, and Hausa; and, like every other considerable human grouping, reveal sharp economic, political, social, and cultural diversities.

And yet it is possible to think of Negroids as one of the three large divisions of mankind. Though not a uniform physical type, they are, generally

speaking, the darkest in skin color and are concentrated in Africa—especially South of the Sahara, in the Caribbean, Brazil, and in the United States of America. Moreover, as color-consciousness spreads throughout the modern world, Negroids are increasingly the objects of a common attitude; likewise, they themselves increasingly manifest a common attitude toward each other and the rest of mankind. The variations and local contradictions sometimes obscure this general tendency.

What did these people do and what happened to them during 1946? Unfortunately, the sources of information are so uneven and inadequate from most parts of the world that the story of the Negro in the United States looms larger than it deserves. Little news of any sort comes out of the South Pacific. Colonial areas suffer the "iron curtain" of censorship in addition to the scarcity of newspapers, books, and public records. Thus, any summary in large part, must be based on trends and events as seen from the United States. The future historian, in looking back to this year, may note that the most important developments took place outside of America or were otherwise subtle or unnoticed.

**War to Peace.** The first calendar year since V-J Day brought with it the full force of the transition from war to peace. Tasks of rehabilitation were everywhere. Servicemen loaded with new and often bitter experiences returned to their homes. Activities which lay dormant during the great war were resurrected.

Melanesia was one of the few areas inhabited by black folk that was an actual battlefield during the war. The native peoples of the Solomons, New Caledonia, and New Guinea whose homes and lands were destroyed by the rude thrust of "civilized warfare" found the great and victorious nations usually generous in rebuilding their towns and villages. It was more difficult to wipe out some of the non-material effects of the contacts with soldiers, sailors, and marines from other parts of the world. A correspondent of an American Negro newspaper remarked that a typical South Sea islander looked like "a Harlem Negro who needed a haircut and a suit of clothes." Others reported that the dark-skinned peoples of the Pacific would never again be the same. They had seen white men in defeat as well as in victory, retreating in mad disorder as well as advancing in confidence and glory. The myth of white invincibility was permanently shattered by events and enemy propaganda. Moreover, this new skepticism was deepened when Negro soldiers from the United States were observed performing duties hitherto associated exclusively with white men. The net impact of the war upon native cultures is worthy of serious study.

North and East Africa were other fields of battle of the great war. The sandy Italian colonies, testaments to Mussolini's dreams of empire, seemed destined to be assigned as trusteeships to the United Nations. Ethiopia found herself blessed by a good food crop but cursed by shortages of supplies and trained personnel in medicine, education, and engineering. Negroes in the United States discussed the appeals of Emperor Haile Selassie for assistance; however, only a few trained men actually made the trip over. Ethiopia made strenuous efforts to "re-annex" Eritrea and that part of Somaliland which bars her access to the sea. These negotiations are still in progress. Newspapers throughout Africa applauded Egypt and the Anglo-Egyptian Sudan when they secured the promise that British troops would be soon withdrawn from their soil.

Liberia, though it did not suffer the clash of arms on its territory, did serve as a major base for American forces during the war. Most of the troops here were American Negroes who have since returned to their own country. The United States commissions subsequently sent over were commended by the Liberian President Tubman for their work in sanitation, nutrition, and public works, but condemned whenever any excursions were made into politics.

All areas were faced by the return of millions of veterans. Some of the colonial governments felt uneasy lest these warriors bring back with their guns and uniforms new ideas from the outside world. This seemed to have been true of all areas in which minorities were subordinated, for similar opinions were expressed in the American South. The black soldier was conscious of his contributions to victory in the war against the Axis with its master race ideology. A growing opinion all over the world shared this view. Slogans such as the "Atlantic Charter" and the "Four Freedoms" strengthened this drive for human rights and justice.

These veterans had given a good account of themselves as fighting men. The Fiji islanders had been termed the best jungle fighters to oppose the Japanese enemy. British East African troops were considered first rate by all who saw them in action. African troops from French territories for a while did most of whatever fighting the "Free" or "Fighting French" did. Long accounts were being prepared of the achievements of American Negroes during the war. Already it was known that more than a million Negro-Americans served in the Army, Navy, Coast Guard, and Marines. They were usually segregated into Negro service units. The fight against "military jim crow" continued inside and outside the armed forces through the war. Despite this, the accomplishments of the Tan Yanks, as they were popularly known, include three presidential citations for combat operations, a highly praised air fighter group, and a long list of individual heroes beginning with Doric Miller, the untrained messman who won the title of "First American hero of World War II" when he shot down four enemy planes during the Japanese raid on Pearl Harbor. The Ninety-second Division—Negro unit commanded by white officers—was criticized for a poor showing, while polls conducted by the Army itself revealed that white soldiers who fought alongside Negroes admired their comrades as soldiers and men. During the course of the war the Navy officially abandoned its policy of racial segregation. The Army made some improvements as set forth in a highly publicized "Gillem Report" but held fast to the essentials of its "Negro policy."

When Negro enlistments for the postwar Army reached 17 percent of the total, although Negroes are but 10 percent of the total population, the Army suspended further Negro enlistment and drafting. Suits and protests against such action resulted in relaxing the prohibition. Stories of the popularity of Negro GIs with German frauleins were advanced by the Negro press as the real reason for the systematic concentration of Negro troops in restricted areas of the overseas occupation. A tour of the European theatre of operation by a commission of Negro Newspaper Publishers Association, at the invitation of the War Department, resulted in strong recommendations for implementing the improvements set forth in the "Gillem Report."

But the main body of Negro servicemen returned to civilian life. The feeling was widespread that

these veterans would insist upon returning to a better life than they had left behind. These new demands, fancied or real, were met in some quarters by concessions: special efforts were made to ensure that all provisions for veterans generally, were extended to Negro veterans. Many Negro and interracial groups set up counseling services. The American Veterans Committee boldly denounced discrimination against any veterans. Negro veterans, in addition to joining such liberal groups as AVC, organized themselves into the United Negro and Allied Veterans. The colonial governments in Africa were more solicitous of veterans than of any other groups.

In certain other quarters—particularly the American South—efforts were made to put the Negro Veterans (and all other Negroes who had equalitarian ideas) "back into their places." A wave of violence broke out with the resurrection of the Ku Klux Klan and the organizing of similar groups, such as the Columbians of Atlanta, Georgia. Of the series of floggings and lynchings, the most notorious were the gouging out of the eyes of Isaac Woodard by a police officer of Batesburg, South Carolina, the lynching of two veterans and their wives at Monroe, Georgia, and a serious clash at Columbia, Tennessee, which was precipitated by the defense on the part of a Negro seaman of his mother from alleged insult and assault. Most remarkable of all was the nation-wide indignation at such outrages and the mobilizing of forces of law and public opinion which broke the teeth of what looked like a campaign of anti-minority terror.

President Truman appointed a Civil Rights Committee, two of whom were Negroes, which would, after study, recommend federal laws that would enable the Federal Government to proceed against such violations of civil liberty.

**Economic Life.** The strangling of the Fair Employment Practices Committee appeared to be the outstanding event in the economic life of the Negro masses. Led by A. Philip Randolph, they threatened a march on the nation's capital to demand a fair share of jobs in war industries. This scheduled march was called off when President Roosevelt issued Executive Order #8802 creating the Fair Employment Practices Committee. Thus was established the principle that the state should guarantee equality of job opportunity without regard to race, creed, or ancestry. The Committee was notably successful in getting a fair chance for employment opportunities for Negroes, Jews, and persons of Mexican or European ancestry, except where strongly entrenched interests such as the railroad operators and unions combined to defy an agency that had no powers of enforcing its directives.

Realizing the temporary nature of the Committee, strenuous efforts were made to get Congress to enact a fair employment practice law. Southern senators not only killed all such bills through filibustering, but finally succeeded in laying the temporary committee itself to rest by stripping it of necessary funds for its operation. These defeats on the national scene were softened by success in setting up state committees for fair employment in New York, New Jersey, Massachusetts, and Indiana.

There was a conference on Negro Business called by the United States Department of Commerce. The shadow cast by the mechanical cotton picker over the future of agricultural labor in the South may have been one of the reasons that less than one quarter of the one million Negro migrants of the war years went back "where they came

#### STRIKES AND PROTEST

from." The movement had been toward the Great Lakes and coasts where the ships and planes were built and the naval installations located. About 250,000 new migrants settled on the Pacific Coast. Their foothold in these new locations was often precarious; yet, during 1946, there was little inclination to retreat.

The integration of the Negro in the organized labor movement was noticeable in the number of black faces seen in the picket lines of the great strikes. In contrast to the situation after World War I, there were virtually no Negroes who served as "scabs" or strike breakers. Both the American Federation of Labor and the Congress of Industrial Organization resolved to organize Negro and white labor in the South. This much discussed "Operations Dixie" got off to a slow start.

The islands of the West Indies which had suffered so much from submarine warfare and shortage of shipping during the war gradually recovered. The Caribbean Conference, held in St. Thomas of the Virgin Islands, February 21 to March 31, considered plans for the economic, political, and cultural development of the area as a whole.

The Council on African Affairs of New York City gave wide publicity to the news of a near-famine among the native people in the Union of South Africa.

**Politics.** War and economics are so closely interwoven with political affairs that the same issues frequently express themselves in all of these fields at the same time.

Negroes generally looked askance at the further liquidation of the New Deal under the Truman administration. The President regained some of his standing with Negro voters through the appointment of William H. Hastie, brilliant Harvard-trained lawyer and former Federal judge, as Governor of the Virgin Islands, and R. O'Hara Lanier, the former Dean of Hampton Institute, as American Minister to Liberia. Both Hastie and Lanier assumed their duties in the spring of the year.

In the fall of the year, the only two Negroes in the national Congress, Adam Clayton Powell, Jr., of New York City, and William L. Dawson of Chicago—both Democrats—withstood the Republican landslide to retain their seats. Some forty-odd other Negro candidates were elected to major political offices throughout the United States.

The main effort of Negroes and their allies in politics for the past few years has been to unlock the huge vote in the Southern states which is barred by poll-tax, the "white primary," not to mention intimidation on the part of hoodlum gangs, and inertia on the part of the potential voters themselves. The Supreme Court helped along this effort by deciding that the "white primary" is unconstitutional. Immediately, various Southern states began to devise new methods of getting around the decision.

Despite these difficulties, Southern Negroes continued to register and more of them actually voted in 1946 than in any election since the Populist Movement in the 1890's. Moreover, they joined with other public-spirited groups throughout the nation in a campaign to "oust Talmadge and Bilbo." When Eugene Talmadge, Governor-elect of Georgia, died December 21, religious-minded persons spoke of his death as "heavenly retribution." After a public hearing staged in Mississippi, the Senate Committee on Privileges and Elections decided that it was not Senator Bilbo, but the election system that kept Negroes from voting in Mississippi. The Negro press decried the Committee's

report as a "whitewash." A second senatorial investigation of Senator Bilbo for fitness for office brought charges against him of receiving gifts from persons he had admittedly helped to secure government contracts.

The meeting of the United Nations in New York was heartening for Negroes as well as for others throughout the world. Haiti, Liberia, and Ethiopia—sometimes described as Negro nations—were well represented. Of the Negroes on the staff of the United Nations Permanent Secretariat, Dr. Ralph Bunche, Director of the Division of Trusteeships, held the outstanding position.

Issues which directly affected the welfare of Negroid peoples were among those that came before the Trusteeship Council and the Economic and Social Council. Dr. Jan Christiaan Smuts, Premier of South Africa, attempted to secure permission from the UN for the annexation by the Union of South Africa of the mandated territory of Southwest Africa. Dr. A. B. Xuma, President-General of the African National Congress, came to New York, and threw the weight of his influence against the proposed annexation. The delegation from India, led by Mrs. Vijaya Lakshmi Pandit, supported the Africans in opposing annexation and was, in turn, supported by the Africans in resisting the efforts of the Union government to impose restrictions upon the 250,000 Indian nationals living in South Africa. Premier Smuts was thus twice defeated.

The National Negro Congress submitted a petition to the UN's Economic and Social Council protesting denial of full citizenship rights to American Negroes. The UN, though moving cautiously to define its jurisdiction and procedures, seemed to be advancing toward a position whereby the rights of minorities are its legitimate concern.

An affiliate of UN, United Nations Educational, Scientific, and Cultural Organization, advanced its work with the aid of Charles S. Johnson, a member of the American delegation to Paris. Dr. Johnson was one of the busiest Negro leaders of the year. In addition to his work with UNESCO, he was one of twenty American educators who advised General MacArthur in Tokio on plans for educating and re-educating the Japanese people. In October, Dr. Johnson was elected the first Negro President of Fisk University.

In Haiti, Dumasais Estime was made President. This followed the revolution which threw out Elie Lescot and subsequent rule by a military junta.

In Jamaica, the recently granted constitution, which for the first time provides universal suffrage rights, was tested in the clash of personalities, economic and political interests. The movement for self-government in West Africa was dramatized by the open fight between the government and Ben N. Azikiwe, editor of the *West African Pilot*. The French in Africa seemed to have made longer and more peaceful strides towards amity between mother country and colonies by abolishing the old designations and converting the empire into a federated republic.

**Social Action.** The National Negro Congress, which had declined during the war years, showed signs of regaining former vigor in its national convention in Detroit, May 30-June 2. About a month later the National Association for the Advancement of Colored People, the largest and most influential social action organization among Negroes in the United States, held its convention in Cincinnati. The National Urban League, the chief social service agency, met in St. Louis. The Association for the Study of Negro Life and History met in Phila-

from." The movement had been toward the Great Lakes and coasts where the ships and planes were built and the naval installations located. About 250,000 new migrants settled on the Pacific Coast. Premier Smuts was thus twice defeated.

The National Negro Congress submitted a petition to the UN's Economic and Social Council protesting denial of full citizenship rights to American Negroes. The UN, though moving cautiously to define its jurisdiction and procedures, seemed to be advancing toward a position whereby the rights of minorities are its legitimate concern.

An affiliate of UN, United Nations Educational, Scientific, and Cultural Organization, advanced its work with the aid of Charles S. Johnson, a member of the American delegation to Paris. Dr. Johnson was one of the busiest Negro leaders of the year. In addition to his work with UNESCO, he was one of twenty American educators who advised General MacArthur in Tokio on plans for educating and re-educating the Japanese people. In October, Dr. Johnson was elected the first Negro President of Fisk University.

In Haiti, Dumarsais Estime was made President. This followed the revolution which threw out Elie Lescot and subsequent rule by a military junta.

In Jamaica, the recently granted constitution, which for the first time provides universal suffrage rights, was tested in the clash of personalities, economic and political interests. The movement for self-government in West Africa was dramatized by the open fight between the government and Ben N. Azikiwe, editor of the *West African Pilot*. The French in Africa seemed to have made longer and more peaceful strides towards amity between mother country and colonies by abolishing the old designations and converting the empire into a federated republic.

**Social Action.** The National Negro Congress, which had declined during the war years, showed signs of regaining former vigor in its national convention in Detroit, May 30-June 2. About a month later the National Association for the Advancement of Colored People, the largest and most influential social action organization among Negroes in the United States, held its convention in Cincinnati. The National Urban League, the chief social service agency, met in St. Louis. The Association for the Study of Negro Life and History met in Phila-

delphia. All these groups and numerous civic unity and interracial committees denounced racial discrimination and pledged themselves to fight for justice and equality.

The Federal Council of Churches of Christ in America continued its campaigns for better race relations among religious institutions. But it was the Congregational churches, in their nation-wide conference, that repented the "sin" of racial segregation and resolved to purge themselves. The African Methodist Episcopal Zion Church held its Sesqui-centennial in New York City.

All schools and colleges reported record enrollments. Fifty-two Negro scholars are now on the faculties of "white" colleges in the North and West, whereas five years ago there were less than five. Abram Harris, to the University of Chicago and Ira De A. Reid, to New York University, were notable appointments. A report released by the War Department revealed that twelve Negro scientists had worked on the atomic bomb projects. The Julius Rosenwald Fund and the General Education Board were among philanthropic foundations that continued their aid to Negro education. The Negro College Fund received more than \$905,000 in contributions from the public. The Conference of Presidents of Negro Land Grant Colleges called on President Truman to petition additional federal aid to education. Further plans were announced for universities to be established in British West Africa and the British West Indies.

"Father" Divine, during the summer, announced his marriage to blond and reputedly wealthy Edna Rose Ritchings of Vancouver, Canada.

In boxing, Joe Louis continued as heavyweight king by disposing of Billy Conn and Tami Mauriello. Jack Johnson, the first Negro to be heavyweight champion and considered by some as one of the greatest pugilists of all time, met his death in an automobile accident. Ray "Sugar" Robinson, for years "the uncrowned welterweight champion," actually won the title on December 20.

Levi Jackson of Yale was the Negro football sensation of the season, outshining Claude "Buddy" Young of the University of Illinois. Morgan College won the Colored Inter-collegiate Athletic Association football title "Jackie" Robinson, owned by the Brooklyn Dodgers, was a star of the pennant-winning Montreal Royals. His batting average was .351.

**Cultural Events.** Many honors, mainly of a symbolic character, came to Negroes during the year. In a precedent-shattering move, Mrs. Emma Clement was selected as "American Mother of 1946." Alain Locke was the first Negro to be elected President of the American Association of Adult Education. The bust of Booker T. Washington, done by Richmond Barthe, was placed in New York University's Hall of Fame. Also, a fifty-cent Booker T. Washington Memorial coin made its appearance.

The Spingarn Medal for achievement went to Thurgood Marshall. The names of twelve Negroes and six white persons were added to the Honor Roll of Race Relations, as the result of the nationwide poll conducted by The New York Public Library, and announced during Negro History Week. Channing Tobias was made Executive Director of the Phelps-Stokes Fund.

On Broadway, *St. Louis Woman*, written by Arna Bontemps and Countee Cullen, had a long run. Unfortunately, Countee Cullen, more famous as a poet than as a novelist or playwright, died before the show opened. Negro actors were in many plays such as *Anna Lucasta*, which closed after

more than three years, and *Showboat*, as well as in plays such as *Deep Are the Roots* and *On Whittman Avenue*, which treated the Negro problem. Canada Lee, who was one of the producers of the latter play, took a "white-face" role in *The Duchess of Malfi*. Camilla Williams was the leading lady in Puccini's *Madame Butterfly*. The African Academy of Arts and Research presented its two-day pageant at Carnegie Hall.

Hollywood was criticized for continued stereotyping of Negro characters. The National Association for the Advancement of Colored People disapproved and the National Negro Congress picketed Walt Disney's *Song of the South*, based on the Uncle Remus tales. Lena Horne and her producers were praised for her glamorous and non-servant roles. The Daughters of the American Revolution, in the face of wide-spread censure, continued their "white artists only" clause in the rental contracts for Constitution Hall in Washington, D.C. The King Cole Trio of radio and stage was voted by several popular music magazines as having "contributed most" to the advancement of music during the year. Duke Ellington again enjoyed crowded houses at his Carnegie Hall concerts.

Books by and about the Negro continued to be written and read in increasing volume but the best-selling book by any Negro author, Frank Yerby's *Foxes of Harrow*, was more about romance in the old South than the Negro. Shirley Graham won the \$6,500 prize presented by Julian Messner Company for *There Was Once A Slave: The Heroic Story of Frederick Douglass*. Richard Wright was royally feted during his visit to Europe. Other books about the Negro by Negro authors were Ann Petry's *The Street* and George Henderson's *Jule*. Books about the Negro by white authors include Buell Gallagher's *Color and Conscience* and Margaret Halsey's *Color Blind*. The George Washington Carver Prize, \$2,400, of Doubleday & Company was not won by a Negro writer but by Fannie Cook, with her novel, *Mrs. Palmer's Honey*.

Negro magazines and newspapers continued their wide circulation, led by *Ebony*, a Life-type monthly, that claimed a circulation of 400,000. The valuable Henry P. Slaughter Collection of Negro Literature went to Atlanta University, which now has one of the nation's eight outstanding libraries on the Negro.

Although the high faith for a better world receded from the peak of the later war years, actual progress seemed to be measurable in most fields.

L. D. REDDICK.

**NEPAL.** A small independent kingdom between Tibet and India, on the southern slope of the Himalayas. The territory includes Mount Everest (29,002 feet). Area, 54,000 square miles. Capital, Katmandu. The government is a military aristocracy based on birth. The king is Tribhubana Bir Bikram, who succeeded his father on December 11, 1911. All power is in the hands of the Prime Minister, a member of the ruling family. This was Gen. Sir Padma Shumshere Jung Bahadur Rana, who succeeded his uncle, November 29, 1945.

The population is estimated at 5,600,000 of whom the majority are Gurkhas, descended from invaders who overran the country in the latter half of the eighteenth century. Gurkha troops fought with the Allies in World War II. Hinduism is gradually replacing Buddhism as the dominant religion. The economy of Nepal depends heavily upon agriculture and animal production. In spite of its mountainous character it is well provided with fertile valleys as well as valuable forests. The prin-

cipal exports are rice, jute, hides, cattle, lumber, oilseeds, and ghee. It is necessary to import textile and metal products, as well as sugar and salt.

**NETHERLANDS.** A constitutional monarchy of north-western Europe. Capital, Amsterdam; seat of the Government, The Hague. Sovereign, Queen Wilhelmina, who succeeded to the throne Nov. 23, 1890, and was crowned Sept. 6, 1898. The country was invaded by German military forces on May 10, 1940, and remained for the most part under German occupation until May 4, 1945.

**Area and Population.** The area, including water belonging to municipal territories, is 15,764 square miles. The population on April 1, 1946, was estimated at 9,319,862. About 94 percent of the people dwell in communities of 2,000 or more. Estimated populations of the chief cities on March 1, 1946, were: Amsterdam, 780,070; Rotterdam, 618,793; The Hague ('s Gravenhage), 482,840; Utrecht, 176,394; Haarlem, 150,773; Groningen, 129,372; Eindhoven, 131,188; Tilburg, 95,142; Nijmegen, 94,102; Enschede, 97,374; Arnhem, 91,928; Leiden, 83,836. The central section of Rotterdam was completely destroyed by German air attacks on May 14, 1940.

**Economic Conditions.** Substantial progress was made during the year toward restoration of Holland's war-torn economy. According to an account given in late November by the Netherlands Ambassador to the United States, Dr. Alexander Loudon, 60 to 70 percent of the country's former producing capacity had been reached at that time. Dr. Loudon also declared that Holland's merchant marine—of which 51 percent was lost in the war—would be back at 75 percent of prewar strength by the end of 1946. Dutch airlines were flying a daily mileage three times as great as before the war. Trains were running on schedule again. Of 220 railroad bridges destroyed, all but nineteen were back in service.

Dispatches from American correspondents in Holland added up to a picture of hard work, frugal living, and measured confidence in the future. To prevent inflation, protect the guilder, and keep the country's credit good, Minister of Finance Pieter Liefthinx carried through a hard-fisted financial policy which, despite some grumbling, found public approval and led to his continuation in office in the July Cabinet shift. Among the drastic measures initiated by Mr. Liefthinx and approved by Parliament were a capital increment tax of 50 to 70 percent on normal, and 90 percent on abnormal war profits and a capital levy ranging from 5 to 25 percent.

To help meet the country's balance of payments deficit both in 1946 and in later years—Holland's trade accounts were not expected to be fully balanced in less than four years—the Finance Minister resorted to extensive borrowing in the United States, Canada, and the United Kingdom. A \$200,000,000 loan, granted in April by the Export-Import Bank, went a long way toward financing urgent imports from the United States, which were expected to amount to from \$300,000,000 to \$400,000,000 in 1946. Nevertheless, on Oct. 30, the Netherlands applied to the World Bank for loans totaling \$500,000,000.

Complaints that Allied occupation policies in Germany were cutting off the Netherlands from its traditional hinterland were frequently made by Dutch officials and economic circles. Before the war, no other country had economic links with Germany as intimate and far-reaching as Holland, but in 1946 trade between the two countries was

practically nil. The Dutch were particularly aroused by what they termed the British "stranglehold" on Germany and charged that Britain was taking advantage of her military control in north-western Germany to build up British trade at the expense of the Dutch.

**Production.** Agriculture, manufacturing, commerce, and mining are the principal industries. Yields of the chief crops in 1945 (in metric tons) were: wheat, 217,843; barley, 92,744; rye, 206,162; oats, 252,345; potatoes, 2,017,756; beet sugar, 449,242; flax, 40,763. Livestock (1942): 2,440,553 cattle, 491,000 swine, 337,177 horses, and 574,497 sheep. The estimated 1940 mineral production was (in metric tons): coal, 13,000,000; pig iron, 300,000; copper, 1,000; zinc (smelter) in 1939, 20,500. The 1939 output of rayon and staple fiber was about 11,000 metric tons; wood and straw pulp, 108,000; butter, 108,400; cheese, 120,600; margarine, 71,000; shipping tonnage launched, 117,000. Bricks, clothing, boots and shoes, engines, boilers, machinery, cotton and linen fabrics, alcoholic beverages, tobacco products, are other leading manufactures.

An official survey of cattle herds made in July 1945 showed an over-all loss in cattle stock of 15.4 percent, but of 21.9 percent in milch cows, as compared with 1940. Cattle numbered 2,277,105, whereof 1,188,212 were cows. Of the prewar stock of 1,553,413 pigs, only 768,733 were left. The country's poultry flock was seriously reduced, from 30,000,000 to about 4,000,000. Coal production, in Limburg province showed a marked upward trend in the latter half of 1945; a daily output of 26,000 tons was reached in November.

**Foreign Trade.** Between the period of August 1945 to May 1946, exports totaled 1,384,210 metric tons and imports 7,786,290 metric tons. Exports for 1946 were estimated at 5,300,000 metric tons, valued at 730,000,000 guilders.

**Government.** The Constitution of 1814, with its various amendments, vests executive power exclusively in the sovereign while legislative authority rests co-jointly in the sovereign and the States-General (parliament). The States-General consisted of an upper chamber of 50 members, chosen by elected representative bodies in the several provinces for terms of six years, and of a lower chamber of 100 members elected for four years by general adult suffrage. In practice the Cabinet was responsible to the States-General and the Premier was normally chosen by the sovereign from a political group commanding a parliamentary majority. The Premier proposed the members of his ministry to the sovereign. After the liberation of the Netherlands, constitutional conditions, which had been suspended by the invader, were gradually restored. On June 23, 1945, Prof. W. Schermerhorn was appointed President of the Council of Ministers.

**Events.** In the early part of the year, the restoration of political normalcy in the Netherlands was completed with the holding of the first general election since 1937. In preparation of this event, in February six minor political groups joined forces with the Social-Democratic party to form a new Labor party. Among the groups participating in the merger was also Premier Willem Schermerhorn's Dutch People's Movement.

Through this amalgamation, the political situation in Holland was greatly simplified and at the same time stabilized. For, in the prewar period, the task of forming a democratic government had been rendered almost impossible at times by the multiplicity of political parties, numbering up to fifty. Most of the smaller groups and "splinters"

made no attempt at revival after the war, but enough of them did so to invite confusion at the forthcoming elections. Even after the seven-party fusion on the Left, eleven different groups made a bid at the poll, but only six of them were important.

The election campaign was dominated by two issues: the future of Holland's rich colonial empire in the East Indies; and the question of government control over the economic life of the nation. On both issues, an informal compromise was reached, before the election, between the two dominant political groups; i.e. the Labor party and the Catholics. The latter accepted the moderate solution for Indonesia proposed by the Laborite Schermerhorn Cabinet, while the former agreed to put off, or soften, its nationalization plans.

**The Elections.** The general election for the Lower House of the States-General was held on May 17. Of more than five million eligible voters—some 120,000 former Nazis had been disenfranchised—4,750,000 went to the polls. As had been generally expected, the middle-of-the-road Catholic party polled the largest vote, 1,466,510, and took first place in the House with 32 seats; the Labor party, with 1,347,664 votes, won 29 seats; the Communists obtained 502,935 ballots and 10 seats; and the Liberals (Freedom party), 305,935 votes and six seats. A total of 1,121,153 ballots were cast for the four Protestant parties; of these the Calvinists took 13 seats in the House, and the Christian-Historical Union, 8.

On May 29, elections to the provincial assemblies were held; these were of almost equal importance, in so far as their outcome determined the composition of the Upper House of parliament. The 50 seats of that Chamber were distributed as follows: Catholics, 17; Labor party, 14; Calvinists, 7; Christian-Historians, 5; Communists, 4; Liberals, 3. In this second poll, 4,695,043 voters cast their ballots.

A third electoral round took place on July 26, when municipal councillors were chosen in Holland's largest cities. In these elections, the Left triumphed over the Catholics. In Rotterdam and in the Hague, the Labor party led the field with 37 and 30.7 percent respectively of the vote cast; in Amsterdam, the Communists came out on top with 32 percent of the vote, followed by the Labor party with 31 percent.

**A New Cabinet Takes Over.** Immediately following the general election to the Lower House, the Provisional Government of Premier Schermerhorn stepped down on May 18. To form a new Cabinet on a majority basis proved an arduous task for Queen Wilhelmina. An attempt to base the government on a coalition of Catholics and Protestants, leaving the Labor party in the opposition, failed; nor could the Left muster a majority, even if the Labor party had been inclined to cooperate with the Communists, which it was not. Thus the only possible solution of the crisis was a continuation, in one form or another, of the former coalition between the Catholic and Labor parties.

On May 27, Queen Wilhelmina asked the leader of the Catholic party, Dr. Louis Joseph Maria Reel, who had been Minister of Interior in the Schermerhorn Cabinet, to form such a government, but it was not until July 2 that Beel succeeded in the task given him. The Cabinet he presented to the Queen was composed of five Catholics and five Labor party members, with three portfolios left to independent technicians. Seven Ministers were retained from the outgoing Cabinet in particular: Dr. Beel, Premier and Interior Minister; Prof. Pieter Lief-tinck (Labor), Minister of Finance; and Willem

Drees (Labor), Minister of Social Affairs. The Foreign Ministry was filled by a Catholic career diplomat, C. G. W. H. Baron van Boetzelaer van Oosterhout, but his predecessor, Eelco N. van Kleffens, was retained as Minister Without Portfolio and Netherlands delegate to the United Nations Security Council.

Perhaps the most important appointment was that of Johannes A. Jonkman, a Laborite lawyer, as Minister of Colonies; he had long been regarded as a warm friend of the Indonesian peoples. The significance of his appointment was further underlined by the selection of Professor Schermerhorn, the outgoing Premier, as Commissioner-General for the Netherlands Indies. Through these nominations, Premier Beel clearly indicated that he intended to continue the conciliatory Indonesian policy of the preceding government, in spite of the pressure for "firmness" emanating from the ranks of his own party and certain Protestant groups. The rift within the Catholic party caused by divergent opinions on this crucial issue deepened in the following months and led to the resignation, on Nov. 16, of Dr. Johannes A. Ringers, Catholic Minister of Public Works and Reconstruction. Dr. Ringers resigned in emphatic protest against the draft agreement for a settlement of the Dutch-Indonesian dispute, which was reached on Nov. 12 (for details, see the article on the Netherlands East Indies). Otherwise, the Beel Cabinet remained in office unchanged up to the end of the year.

**Continuation of the Purge.** Both the two principal Dutch quislings, who had been condemned to death late in 1945 were executed by firing-squads, early in 1946. The first to die was Max Blokzijl, on March 16; Anton A. Mussert was executed on May 7. Each of the two traitors had appealed first to the Cassation Court, and then to the Queen, for clemency. The pleas were rejected, not without some hesitation, amidst a lively public controversy about the re-application of the death penalty after almost a century of disuse in the Netherlands.

With the advent of the Beel Government, that part of public opinion which advocated leniency toward the smaller fry of Nazis and collaborators gained the upper hand. "The time has now come to exercise compassion," Mr. Beel told Parliament shortly after his induction as Premier. He announced that he hoped to reduce the number of political prisoners from about 70,000 to 25,000 before the end of the year. It was understood that those earmarked for long detention would eventually be shipped to a North Sea island, or to a place in the colonies.

**Claims on Germany.** With little hope of recovering from Germany even a fraction of the \$14,000,000,000 reparations bill computed by Dutch economic and financial experts, the new Government sought other ways and means to obtain at least partial compensation for the damage done by the Nazis. At a special Cabinet meeting held on Oct. 21 a number of frontier changes which had been widely discussed in the press were considered. Throughout the debate, both government officials and the press took great care to disclaim any annexationist designs, using instead the term "frontier corrections."

On Nov. 1 the Netherlands Government, in a simultaneous demarche with Belgium and Luxembourg, submitted to the Big Four powers an "urgent request" that it be "associated from the beginning" in the making of a peace settlement with Germany. Four days later, the Netherlands ambassadors in Washington, London, Moscow, and Paris filed formal claims on Germany.

The territorial revisions sought by the Dutch turned out to be even more modest than had generally been expected. They were designed primarily to straighten out Holland's strategic border by eliminating a number of German salients or "bulges." Only 700 square miles, with a population of 119,000, were involved in the desired transfers; the inhabitants would be permitted to remain and become Netherlands citizens, unless they had criminal records. The proposed changes would affect rural areas only, with the new boundary line running slightly west of the German cities of Aachen, Geilenkirchen, Heinsberg, Geldern, Coch, Cleve, Emmerich, Nordhorn, and Emden. The East Frisian island of Borkum was also requested, along with a number of economic concessions.

JOACHIM JOESTEN.

**NETHERLANDS EAST INDIES.** A group of large and small islands in the East Indies forming the main overseas territories of the Netherlands Kingdom, conquered and occupied by Japanese armed forces from 1942 until the surrender of Japan in September, 1945. Capital, Batavia, on the island of Java.

**Area and Population.** The area, population at the 1930 census, and population density of the island groups are shown in the accompanying table.

Group of islands	Sq. mi.	Population	Density*
Java and Madoera	51,032	41,718,364	817
Sumatra	164,118	7,677,826	47
Riouw-Lingga	12,235	298,225	24
Bangka	4,611	205,363	45
Billiton	1,866	73,429	39
Borneo			
West district	56,664	802,447	14
South and East districts	151,621	1,366,214	9
Island of Celebes			
Celebes	38,786	3,093,251	80
Manado	34,200	1,138,655	33
Molucca Is. & New Guinea	191,682	893,400	5
Timor Archipelago	24,449	1,657,376	68
Bali and Lombok	3,973	1,802,683	454
Netherlands East Indies	735,268	60,727,233	83

\* Density per square mile.

The estimated population in 1940 was 70,476,000, including 68,832,000 natives. Java and Madoera had 48,416,000 inhabitants, the Outer Provinces, 22,060,000. There were about 250,000 persons classed as Europeans (many had some native blood), including 220,000 Dutch Chinese numbered about 1,200,000, other alien Asiatics (mostly Hindus and Arabs), 115,000. Over 92 percent of the population is rural. Chief cities (with latest available populations): Batavia 606,800, Soerabaja (Surabaya) 390,700, Semarang 217,796, Bandoeng 166,815, Soerakarta 165,484, Djokjakarta (Jogjakarta) 136,649, Palembang 109,069.

**Education and Religion.** According to the 1930 census, there were 4,296,579 literate persons, of whom 400,877 were able to write Dutch. In 1940 there were 17,718 village schools with 1,896,374 pupils, 3,607 other primary schools (public and private) with 467,076 pupils, 41 secondary schools with 8,686 pupils, and various vocational and special schools. Higher education was given in the Technical College, Bandoeng, and in colleges of law, medicine, agriculture, science, literature, and philosophy at Batavia. About 20 per cent of all pupils attended missionary schools.

About 90 per cent of the natives are nominally Mohammedans and there are about 2,500,000 Christians and 1,000,000 Hindus. However all three religions are superimposed upon the prevailing spirit and ancestor worship.

**Production, etc.** Agriculture and mining are the chief occupations. The islands normally produced

the following percentages of the world's annual yields: quinine 90, pepper 79, kapok 70, rubber 38, copra 30, oil palm products 20, tea 17, coffee 6, sugar 5. The islands were likewise a leading source of petroleum and tin. Bauxite, manganese, and coal were other mineral products. In 1941 6,000 factories and workshops were engaged in processing agricultural and mineral products for export. Foreign trade (1940): imports 444,300,000 guilders; exports 873,500,000 guilders (guilder = \$0.53). In prewar times the chief trading countries were: United States, British Malaya, Netherlands, Australia, New Zealand, Great Britain, and Japan. Finance (1942 estimates): revenue 750,918,773 guilders, expenditure 813,802,815 guilders. The public funded debt (Jan. 1, 1942) totaled 1,233,839,000 guilders.

**Government.** Under Dutch rule, the islands were considered an integral part of the Kingdom of the Netherlands. The Government at Batavia handled only local affairs under the guidance of the mother country. There was a Governor General appointed by the Crown, assisted by an advisory Council of the Indies, a cabinet, and a Volksraad (legislative assembly) of appointed and elected members with limited legislative powers. The Netherlands Government appointed the 5 members of the Council of the Indies and 2 (the war and navy ministers) of the 8 members of the Governor General's cabinet Governor General: Dr. H. Van Mook.

**Events, 1946.** In the course of the year, the conflict between the Netherlands and its vast colonial possessions in the Far East slowly but steadily was brought nearer to the only possible peaceful solution: a compromise on the basis of voluntary partnership between free and equal states.

Such a solution had been outlined by Queen Wilhelmina in her policy-making speech of Dec 6, 1942. With reference to this address, the Netherlands Government on Feb 10, 1946, made public a detailed offer to the Indonesians, which would provide for a self-governing commonwealth of Indonesia under the Crown, with equal civic rights for Indonesian and Dutch citizens in all parts of the Kingdom.

A few days earlier, tripartite discussions had begun in Batavia, in which the Dutch authorities, headed by Dr. Hubertus J. Van Mook, Acting Governor-General of the Netherlands East Indies, were brought together with the Indonesian leaders under the moderating influence of Sir Archibald Clark Kerr, British special envoy.

The pourparlers progressed slowly. Premier Sutan Sjahrir of the unrecognized Indonesian Republic advised acceptance of the Netherlands plan as a basis for negotiations, but other leaders of the Indonesian National Committee insisted on full independence and expressed distrust of Dutch motives. This distrust grew as more troops arrived from Holland in March to take over military control from the British forces.

Early in April, the negotiations were shifted from Batavia to The Hague. Sjahrir, who in the meantime had reshuffled his Cabinet, sent three of his Ministers on the trip to Holland. This brought the parties nearer agreement on some details, but failed to produce a settlement.

In mid-June, the Indonesian Government handed to Van Mook counter-proposals demanding Indonesian authority over Sumatra as well as Java, and offering an alliance with the Netherlands in return for independence. On June 29, Sjahrir and five members of his Cabinet were kidnapped by an armed band of extremists, but were released two days later. Rumors that the coup had been in-

spired by President Soekarno proved groundless.

On July 14, British military authorities formally turned over to the Netherlands Indies Government all the Dutch possessions in the Far East liberated from Japanese rule, with the exception of Java, Sumatra, and the Riouw Archipelago, which were effectively controlled by Indonesian forces, outside of the great cities held by British and Dutch troops. The Indonesian Government immediately protested the British move.

On August 30, the Netherlands Parliament set up a commission general, headed by former Premier Willem Schermerhorn, to investigate the Indonesian situation and seek a settlement with the native leaders. The commission arrived in Batavia on Sept. 18 and immediately renewed negotiations with the Indonesians. The talks were again conducted under the neutral chairmanship of a British special envoy, Lord Killearn.

The first concrete result of this parley was the conclusion, on Oct. 14, of a truce between the Dutch and Indonesian military forces. This was designed to put an end to the intermittent, and sometimes savage, fighting which had continued through most of the year. The truce, which involved some 200,000 armed Indonesians and 47,000 Dutch troops, cleared the way for decisive political negotiations.

After four more weeks of arduous discussions, a draft agreement was finally reached at Cheribon on Nov. 12. The terms of the accord were made public on Nov. 18, amid new sporadic outbursts of violence in Java.

The Cheribon Agreement provided for the establishment of a United States of Indonesia, consisting of three autonomous states: (1) the Republic of Indonesia, including Java, Sumatra, Madoera and adjacent smaller islands; (2) Dutch Borneo; and (3) the "Great East," i.e. Celebes, the Moluccas, and the Lesser Sunda Islands. The federation would be formed, and would receive full international recognition, by Jan. 1, 1949.

While fully autonomous in internal affairs, the United States of Indonesia would remain allied to the Dutch Kingdom through the establishment of a Netherlands-Indonesian Union. The two components of this union would be partners of equal rank, bound together by common fealty to the reigning sovereign of the Netherlands. They would cooperate on foreign affairs, defense, finance, and economic as well as cultural subjects.

The Cheribon Agreement was hailed throughout the world as a masterpiece of compromise, but it met with fierce opposition both from colonially-minded Dutch circles and from extreme nationalists in Java, to whom even the purely nominal allegiance to the Queen appeared repugnant.

While the accord was being studied by the Netherlands Government and the States-General, British forces completed their evacuation of the Netherlands East Indies in the last days of November. The situation on the islands remained tense, however, and some fighting between Dutch and Indonesian troops was still reported early in December.

JOACHIM JOESTEN.

**NETHERLANDS WEST INDIES.** The colonial possessions of the Netherlands in the West Indies, comprising Curaçao and Surinam (or Netherlands Guiana), see below.

**Curaçao.** A Netherlands colony comprising two groups of islands 500 miles apart. One group just north of Venezuela includes Aruba (69 sq. mi.), Bonaire (95 sq. mi.), and Curaçao (210 sq. mi.);

the other group just east of the Virgin Islands includes Saba (5 sq. mi.), St. Eustatius (7 sq. mi.), and the southern part of St. Martin (17 sq. mi.). Total area, 403 square miles. Population (January 1, 1945), 124,866. In 1944 there were 4,279 births and 1,104 deaths. Willemstad (capital), on the island of Curaçao, had 37,261 inhabitants (Jan. 1, 1945). Chief products: refined oil (from imported crude oil), straw hats, phosphate of lime, and salt. Oil refining is the most important industry. Trade (1944), excluding petroleum: imports were valued at 92,185,449 guilders; exports totaled 6,245,254 guilders. Air services link Curaçao, Aruba, Jamaica, Trinidad, and North and South America. Shipping entered the ports (1944): 14,885 ships of 146,180 tons. Budget (1945): revenue 28,177,919 guilders; expenditure 27,924,623 guilders (the exchange value of the guilder was \$0.3793 in December, 1945). Curaçao is administered by a Governor, assisted by a council of 4 members, and a States Council of 15 members (10 elected by the voters and 5 nominated by the Governor). Governor, Dr. P. A. Kasteel (appointed May 21, 1942).

**Surinam (Netherlands Guiana).** A colony on the northern coast of South America, belonging to the Netherlands. Area, 54,291 square miles. Population (1944), 191,628, including the Negroes and Indians living in the forests. Chief towns: Paramaribo (capital), 60,723 inhabitants, Nieuw Nickene, 5,000, Albina, Coronie, and Moengo. Vital statistics (1944): 5,346 births, 2,467 deaths, and 622 marriages. Education (1944): 115 schools and 18,243 students. The principal agricultural products are sugar, rice, maize, coffee, cacao, balata, bananas, oranges, molasses, rum, and timber. Minerals produced include bauxite, gold, and salt. Trade (1945): imports 12,626,652 guilders; exports 7,432,264 guilders. Shipping (1944): 301 vessels of 1,135,201 register tons cleared. Budget estimates (1945): revenue 9,541,294 guilders, expenditure 8,167,000 guilders. The executive authority and administration are under a Governor, assisted by an advisory council. There is a representative body called the States of Surinam consisting of 15 members (5 appointed by the Governor and 10 elected by the voters). Governor, Dr. J. C. Brons (appointed November 19, 1943).

**NEW BRITAIN.** The largest island in the Bismarck Archipelago in the Territory of New Guinea, mandated to Australia by the League of Nations. The island is 300 miles long and has an average width of 50 miles; area, 14,600 square miles. The native population of patrolled areas was 101,587 on June 30, 1941. Rabaul, the capital and chief port and settlement, had a non-native population of 4,674. There are many good harbors, the chief being Linden Haven, Powell Haven, Simpson Haven, Jacquot Bay, and Arawe. See NEW GUINEA, TERRITORY OF.

**NEW CALEDONIA.** A French island possession in the southwestern Pacific, 850 miles east of Australia. It is 248 miles long and has an average width of 31 miles. Total area (including dependent islands), 7,336 square miles. Population in 1942, 56,000 (20,000 whites and half-castes and the rest Melanesians and Polynesians). Capital: Nouméa (12,000 inhabitants). The dependencies of New Caledonia are: Isle of Pines, Wallis Archipelago, Fortuna and Alofi, Loyalty Islands, Huon Islands, Bépél Archipelago, Chesterfield Islands, and Walpoole. Chief agricultural products: coffee, copra, cotton, manioc, maize, tobacco, bananas, and pineapples. Mineral products include nickel, chromite, cobalt, iron, and

manganese. Trade (1944): imports 405,000,000 francs; exports 227,000,000 francs. The local budget for 1945 was balanced at 141,538,000 francs. A Governor, assisted by a privy council and an elected general council, administers the government. Governor: A. Tallec.

**NEWFOUNDLAND.** An island lying between the Gulf of St. Lawrence and the Atlantic Ocean. Its dependency, Labrador, lies north of the Gulf of St. Lawrence, between the Province of Quebec and the Atlantic. Newfoundland, with Labrador, forms a part of the British Empire. Area, exclusive of Labrador, 42,734 square miles. Population (estimated) at the end of 1943, 313,022. Capital, St. John's (55,000). The dependency of Labrador has an area estimated at 110,000 square miles and a population in 1935 of 4,716.

**The People.** The inhabitants are mostly of English and Irish descent. The Roman Catholic Church and the Church of England each included more than 90,000 persons in 1935, with the United Churches also including large numbers. From 7 to 10 percent of the adults are illiterate, but a school attendance act providing for free and compulsory education of children from 7 to 14, which went into effect in 1942, was expected to improve the situation.

**Economic Life.** Agriculture on the island has not yet reached a point where it can support domestic demands. The soil in many sections is considered unfertile. The Commission has extended land surveys and has planned to establish some of the islanders on farms capable of providing a livelihood.

The greater part of the population lives on the returns from fish products, newsprint and mineral ores. In 1946 a considerable part of the fish exports went to UNRRA, and the business hoped that with the cessation of these orders the former European and South American markets would be restored. Newsprint goes to the United Kingdom and the United States, iron ore chiefly to Canada, and zinc and lead principally to the United States. Estimates of the male labor force vary, but in the relatively normal year of the 1935 census it was set at 77,700 with nearly one-half (36,000) in the fish industry.

The greater part of the imports come from Canada. The Government depends on tariffs as the chief source of revenue, with \$17,000 from that source in 1945 out of a total revenue of \$33,000.

**Government.** As a result of acute financial difficulties caused by the depression in the export industries Newfoundland's status as a self-governing dominion of the British Commonwealth was temporarily altered in December, 1933, to that of a British colony. The British Government assumed responsibility for Newfoundland's financial obligations and provided an annual grant-in-aid pending restoration of the island treasury's financial solvency. Effective February 16, 1934, executive and legislative authority was vested in the Governor and a Commission of Six—three Newfoundlanders and three British—all appointed by the British Government. Each member of the Commission has charge of a government department. Governor, Sir Gordon Macdonald, appointed January 16, 1946. For contemplated changes in government, see below.

**Events, 1946.** Newfoundland was occupied throughout the year with preparations for the convention to determine the future status of the former dominion and later with the deliberations of the convention itself, which were not concluded when the year ended. On December 11, 1945, the British Government had announced that the people of

Newfoundland were to elect the members of a convention by full adult suffrage (see *YEAR BOOK* for 1945, p. 424). It was also proposed to present a comprehensive economic and financial survey of the country for the information of the convention.

The reforms planned for Newfoundland by the Commission members proved only moderately successful, but the war brought the establishment of vast bases, increased employment and accumulated treasury surpluses of nearly \$30,000,000 by 1946, so that, instead of borrowing from Britain, Newfoundland was able to advance that country interest-free loans. In the year ended March 31, 1946, Newfoundland had a per capita debt of only \$283 as compared with Canada's \$1,400. After the close of the war the transplanted workers tended to revert to their former occupations in Newfoundland or to emigrate.

**Convention Sessions.** In the election held in June, 1946, the specified number of 45 members for the convention were elected from a slate of 129 candidates, by a 70 percent poll with women voting heavily. The convention opened its meetings in St. John's on September 12. It was charged with the duty of recommending to the people of Newfoundland a form of government on which a referendum must then be taken.

The three practicable alternatives appeared to be: (1) retention of the commission form of government; (2) home rule; (3) confederation with Canada. In a poll conducted by a St. John's newspaper, in which 11,000 votes were cast, a commission of elected Newfoundlanders took first place with 3,734 votes. Approximately 2,000 voted for each of three other possibilities: confederation with Canada, union with the United States and union with the United Kingdom. Responsible government received only 550 votes.

Early in November a proposal to send a delegation to Ottawa to learn Canada's terms for union was defeated in the convention after a week's debate. It was understood that this did not mean that the convention was unwilling to learn Ottawa's terms, but merely that the convention should first complete its investigation into Newfoundland's affairs so that Newfoundland should not go as a suppliant but as a country offering terms as well as asking for them.

When the convention began a three-week Christmas recess there was little indication which form of government would be recommended. In lively debates in the closing days before recess many delegates expressed hostility towards the existing British-sponsored administration. In spite of the evidence of the unofficial poll, it appeared that many delegates favored dominion status and responsible government.

**Agreement on Bases.** At an air conference held early in the year by Newfoundland, Britain, and Canada an agreement was concluded concerning the disposition and use of certain defense installations in Newfoundland. During the war Canada, by agreement with Newfoundland, had assumed responsibility for the operation and control of Gander, Gleneagles, and Botwood air bases for the duration of the war, and later constructed Goose Bay air base, in Labrador, and Torbay air base, near St. John's. By agreement with the British and Newfoundland governments Canada also constructed, on behalf of the British Admiralty, a naval base at St. John's. These bases were available to Britain and the United States.

The new agreement, announced in May, provided that control of the air bases at Gander, Gleneagles, and Botwood should be handed back to

Newfoundland in accordance with the original understanding. Canada was to continue to operate Torbay airport as a civil airport for the Newfoundland-Canada service. The agreement also provided that Canada and Newfoundland, and as necessary the British Government, would consult with one another as occasion might require with a view to coordinating defense in Newfoundland.

In the course of the year the Gander airport was developed by the civil aviation department of the Newfoundland Government and the eight international lines operating through it, Air France, American Overseas Airlines, British Overseas Airways Corporation, Royal Dutch Airlines, Pan-American World Airways, Scandinavian Airlines System, Trans-Canada Airlines, and Trans-World Airlines. James M. Eaton, American Overseas Airlines vice-president, served as chairman of the airlines' Gander Airport Committee which coordinated the project.

#### ALZADA COMSTOCK.

**NEW GUINEA.** An island in the East Indies, north of Australia. It comprises Netherlands New Guinea (151,000 sq. mi.), North East New Guinea (69,700 sq. mi.)—the mainland part of the Australian mandated Territory of New Guinea, and Papua (87,786 sq. mi. excluding islands)—a Territory of Australia (formerly called British New Guinea). Total area, 308,486 square miles. Population, approximately 1,000,000. See NEW GUINEA, TERRITORY OF; PAPUA.

**NEW GUINEA, Territory of.** A territory administered by Australia under mandate conferred by the League of Nations from December 17, 1920; occupied by Japanese armed forces during 1942-43; reconquered (by June of 1944) by the Australian and Allied armed forces. On October 18, 1946, Australia proposed to the United Nations that she continue as administering authority of the mandate. It comprises North East New Guinea (also called the Mainland), 69,700 square miles; Bismarck Archipelago (consisting of New Britain 14,600 sq. mi., New Ireland 3,340 sq. mi., Lavongai 460 sq. mi., and Admiralty Islands 800 sq. mi.), 19,200 square miles, and part of the Solomon Islands (Bougainville 3,880 sq. mi., Buka and adjacent small islands 220 sq. mi.), 4,100 square miles. Total area, 93,000 square miles. Total enumerated natives in patrolled areas (June 30, 1941), 684,284, including 34,087 indentured laborers; in addition, there were 4,101 Europeans and 2,228 Asiatics. Rabaul (on New Britain), had 10,174 inhabitants in 1939. Chief towns of North East New Guinea: Aitape, Lae (capital of the Territory), Madang, Monumbo, Morobe, Salamaua, Vanimo, and Wewak.

**Production and Trade.** In 1940-41 the output of gold amounted to 263,097 fine ounces valued at £2,808,835. Platinum, osmiridium, copper, iron, sulfur, and brown coal have been found. The area under cultivation in 1940 (exclusive of native reserves) was 277,533 acres, of which 261,676 acres were devoted to coconuts (71,583 tons of copra produced in 1940), cocoa 5,827 acres, rubber 2,481 acres, and coffee 2,792 acres. Livestock (1939-40): 20,474 cattle, 9,327 goats, 6,160 pigs, 1,184 sheep, and 1,323 horses. Timber and fish are other products. Trade (1940-41): imports £962,129; exports £3,253,984. Shipping (1940-41): 95 vessels aggregating 216,365 tons cleared.

**Government.** Finance (1940-41): revenue £423,750; expenditure £431,792 (the official exchange rate of the Australian £ was \$3.228 in 1940, 1941,

and 1942). Administrator: Maj. Gen. J. K. Murray (appointed Sept. 15, 1945).

**NEW HEBRIDES.** A British-French condominium in the South Pacific, 250 miles northeast of New Caledonia. The chief islands of the group are Espiritu Santo, Malekula, Epi, Ambrym, Efate, Erromanga, and Tanna. Population (1944 estimate): about 43,000, of whom about 40,000 were natives, 112 British, 792 French, and the remainder almost entirely Asiatics. Capital, Vila. The British High Commissioner and the French High Commissioner for the region delegate the powers of government for the New Hebrides to Resident Commissioners of the respective nationalities stationed on the islands. The chief exports are cocoa, copra and coffee. Sugar, cotton and fruits are also produced.

**NEWSPAPERS.** Newspapers in the United States in the first full year of peace enjoyed the largest circulations in their history, and a volume of advertising limited generally only by the supply of newsprint available. On the other side of the ledger they were faced by increased costs on a scale never before known; newsprint was advanced first \$7 and then \$10 more a ton to the highest contract price on record. Wage scales, particularly those negotiated in the latter part of the year after the end of OPA, recorded increases never before equalled in any twelvemonth. Labor relations in the newspaper field deteriorated badly and the year was marked by a number of costly strikes of long duration.

The cause of a free press gained moderately in the world, but not so much as had been hoped for in the aftermath of a war fought for freedoms. In the occupied countries the press was under control of the governing authorities. The chief progress in the direction of free news and opinions was in the continuing international discussion of its importance.

The number of daily newspapers in the United States gained slightly both in 1945 and 1946, reversing a trend of many years. Undoubtedly more new dailies would have been born had it been possible to obtain newsprint. Twenty-eight new English language daily newspapers began publication in the United States during 1946. Morning newspapers totaled 334, a net gain of 4 in 1946; evening newspapers totaled 1,429, a gain of 10. Sunday newspapers numbered 497, a gain of 12.

Circulations expanded in virtually every country. In the United States the total sale of newspapers rose to 50,927,505 daily according to the report in the year book of *Editor & Publisher*, the trade publication. Sunday newspapers showed the greatest percentage gain (9.5) over the previous year, morning weekday issues gaining 6.7 percent and evening 4.2 percent. The estimate was made that readers in the United States and Canada spent \$803,593,000 a year for their newspapers.

Circulation prices were increased throughout the country. Higher expense in every department of publication made it advisable to obtain more income from circulation—a stable cash income—and the trend of recent years toward getting a higher proportion of revenue from readers was intensified. A new law required weekly newspapers to publish statements of circulation as well as of ownership; they had been exempted from this requirement in the act of 1912. Incidentally the attaining of record high circulations after the end of the war surprised some observers; but the reasons were not difficult to discover. The people had money to spend, and the news of economic read-

justments affected the individual even more than the tidings of a remote war.

Advertising gained substantially in volume and rates were advanced. Some restrictions upon space were kept because of newsprint limitations but the total newspaper advertising was estimated to be 20 percent greater than in 1945. Delayed production of goods held back the advertising of national companies such as automobiles and household equipment, but these were expected soon to be in a competitive market and to use larger space. An increase of \$16,000,000 in the expenditure in this classification was registered despite the difficulties of production.

Interesting developments in newspaper advertising were the decision of *PM*, the New York newspaper owned by Marshall Field, to abandon its policy of trying to get along on circulation revenue alone, and to accept advertising; the publication of an exhaustive study of the place of the newspaper in national advertising, by the Harvard School of Business Administration; and the actual beginning of operations by an American Newspaper Advertising Network. This last was an experiment in permitting advertisers to buy a selected "package" of newspapers in many markets in a single insertion order. Its success had not been sufficiently tested as the year ended, but the need of some such agency was generally admitted. The conclusions of the Harvard study were that neither newspaper publishers nor national advertisers had developed the potentials of the use of space in daily publications, and that intelligent research and promotion were needed.

As in the war years, newsprint remained a problem. The Office of Price Administration control was ended. A few publishers objected to ending the controls over the amount of newsprint one was permitted to buy and use, fearing that in an unrestricted market some smaller newspapers would be left out. Some difficulties were experienced by small users who purchased through agents and not direct, by contract, from mills; but these were fewer than had been expected and voluntary steps were taken to see that no legitimate publication was forced to suspend.

The base price of newsprint rose in two jumps of \$7 and \$10 to \$85 a ton. This still was far from the top of \$130 a ton in 1921, just after the first World War; but it was more than double the \$40 price which obtained in 1933-34-35-36. Reports were received that spot newsprint was being sold at fantastic prices.

United States newspaper publishers had witnessed an \$180,000,000 increase in their newsprint cost in five years, according to a reliable estimate. Moreover, no appreciable relief was in sight in the world supply. Such production as the Swedish and Finnish mills might have available went to Europe, South America and elsewhere at prices far above that paid in the United States. Newspapers in those countries had fared far worse than in North America, and continued to print issues limited in size and number.

More mills in the United States stopped making newsprint and turned to higher priced products. Canada, the main source of supply, held up its volume and furnished 3,288,000 tons despite some labor troubles. Manufacturers warned that no great increase in this total could be expected in the near future; as for prices, in the face of the world situation, publishers felt reasonably secure against a runaway market in the United States.

Labor occupied the attention of publishers more than in any year before. Through the war years

increases in scales had been limited to 15 percent over the January 1, 1941 levels. Labor had been restive under these limitations; and with the rise in the cost of living, which had been gradually apparent and pressed itself upon the wage-earner's attention as the war ended and OPA controls were relaxed, then stopped, labor pressed its demands.

Strikes were numerous, and in many departments of operations. The principle of arbitration lost substantially. More and more unions adopted international laws forbidding the incorporation of arbitration clauses in contracts. Wage demands in the union proposals were unrealistic, to put it mildly. In many cities unions proposed weekly scales of \$110 and \$115, representing increases of nearly 100 percent.

Settlements were made which gave the workers a greater dollar increase in one year than they had gained in any three or four-year period before. Scales went up in some cities as much as \$14 and \$15 weekly, and gains of \$10 to \$12.50 were widespread. Hours were reduced in some contracts. The Bureau of Labor Statistics issued figures which showed that the average hourly wage of \$1.47 in the newspaper and periodical industry was far higher than in any other; and the scale increases in 1946 were certain to add to this differential. While an increase of 18½ cents an hour was the figure over which struggles were fought in the motor and other industries, newspaper unions won hourly gains of 25 to 40 cents.

In the year a total of sixty-three newspapers in thirty-seven cities suffered from strikes. In all there were thirty-nine strikes, some of them affecting more than one newspaper. Of these twenty-five were initiated by the typographical union. Pressmen began five strikes and the guild four strikes. The main issue was wages. The cost was tremendous to both publishers and workers. In Springfield, Massachusetts, all four daily newspapers were suspended for months, and the year ended with no solution in sight. In Rochester the *Gannett* newspaper ceased publication for many weeks, and after agreement on a scale, the workers refused to go back to work unless they were paid for the time they had been on strike. In Los Angeles the guild struck in its attempt to get the \$100 weekly scale which the national union had set as the goal of editorial workers. Settlement was finally achieved at a reasonable figure approximating \$75.

Both publishers and workers were aware that labor relations had deteriorated seriously in the year. The prime cause was the cost of living. Some unions, however, by international action, adopted laws which promised no improvement in collective bargaining. The guild, in its convention, voted overwhelmingly for support of the CIO political action program. Several unions approved large sums for organization and support of strikes.

Abroad the newspapers suffered under different troubles. In Great Britain Parliament announced an inquiry into the press. The proposers expected to show ownership of a large proportion of the press by a few wealthy persons, and a lack of public responsibility. (In the United States a congressional inquiry into the difficulties of small newspapers was announced for January 1947 and was later postponed.) The British newspapers still were sharply limited in their newsprint supplies and continued to publish small issues. Under the increased ration allowed in September the 4-page one-penny newspapers were enabled to print six pages three times a week. A determining factor was the necessity for limiting imports and conserving the foreign exchange balance. Despite

these limitations, circulation of the *Sunday News Of The World* rose to an unprecedented figure of 7,412,383 copies, a total not approached by any other newspaper in any land. A long range program of newsprint imports, running into 1950, was set up by a British Committee; an "escalator" scale was provided allowing for an annual average of six page papers in 1947, eight page in 1948, ten page in 1949 and twelve page in 1950. Advertising space restrictions were removed in November, 1948.

If one excepts the Parliamentary inquiry which was attacked by some as a curb on the rights of the press, the British newspapers retained their customary freedom. In general, too, this freedom was increased throughout the world. Rigid censorship prevailed in Spain and Portugal and in the countries in the Russian zone of influence. In South America, Argentina curbed the newspapers as in recent years, and some tendency in this direction was noted in Chile, Uruguay, Bolivia and elsewhere, as political tensions increased.

Correspondents of United States newspapers enjoyed reasonable freedom. Russia remained difficult as a land in which to gather and send news unhampered. The pressure on writers in Yugoslavia, Rumania and other countries was not too rigid. In Germany the licensed press was quite free in the American-British and French zones, but restricted in the Russian sphere of control. Some military regulations governed newspapers in Japan, but correspondents were relatively free except for questions of "military security."

In France newspapers were permitted to increase from two to four pages in June. The Government authorized all publications. Most of the small newspapers which sprang up were mere party organs printing opinions and not news. The largest circulation was that of *L'Humanité*, a Communist daily, and the next that of *France-Soir*, with 600,000 copies. The Havas News Agency had been suspended by the government for collaboration. Plans were in the making for a cooperative news agency owned by the publishers similar to the Associated Press. The question of confiscation of the considerable number of newspapers charged with collaboration continued to be debated. The value of these properties, which included such journals as *Le Matin* and the *Petit Parisien* was estimated at \$70,000,000.

In the United States many publishers continued to suspect an effort on the part of Government to control or harass the newspapers; this was not shared by more objective observers. The Supreme Court ruled that newspapers were subject to the wage-hour laws, but open minded publishers had long said that newspapers properly were subject to all welfare legislation governing general business. Some fear was expressed that the Kefauver bill prohibiting mergers of corporations in interstate commerce might forbid the joint operation of newspapers and thus abridge the freedom of the press. The bill was not passed and the author disavowed the application of the bill to newspapers.

The Associated Press and the United Press, which had supplied their news services to the Government for use by the OWI during the war, declined to continue them for use by the State Department in broadcasting news overseas. Despite pleas by William Benton, Assistant Secretary of State, the services maintained their stand. The American Society of Newspaper Editors, in a committee report, later backed the State Department's broadcasting proposal. The Associated Press had feared the use of its news service in propaganda.

An important step was taken by the State Department in suggesting that the United Nations place consideration of world freedom of information in the hands of a special group. Such freedom of information was to be incorporated in a broad international bill of rights.

The first report of the commission on the freedom of the press, a body established chiefly by Henry Luce and Time, Inc., to study this question was issued by Llewellyn White and Dr. Robert D. Leigh. This report entitled *Peoples Speaking to Peoples* argued strongly for free interchange of news, and a multilateral covenant to assure this flow across national borders. Some of its other proposals, however, seemed to provide for the entrance of government agencies into the field of news dissemination. The continued discussion of world freedom of news was outstanding in 1946.

A collateral issue affecting editorial independence was the hearing by the Federal Communications Commission in the application of the New York *Daily News* for a radio station license. The application was opposed by some groups on the ground that the newspaper allegedly had been anti-semitic in its opinions and news. The right of a government commission to question a newspaper's opinions was challenged by counsel for the *News*.

The famous case involving the bylaws of the Associated Press, in which the government won its effort to compel a change, was ended. The directors voted that competition by an applicant with members of the association was not to be considered in voting on admission. The court ruled that so long as this amended bylaw was in force the injunction against the Associated Press would be stayed. A group of 114 publishers voted to petition congress to amend the anti-trust laws to permit any press service to exercise its own discretion in the selection of its members. Such a bill was introduced and failed of passage.

Kent Cooper, executive director of the Associated Press, reported that it was serving 2,604 clients, newspapers, and radio stations, in twenty countries. Hugh Baillie, president, said that the United Press reached a total of 2,529 newspapers and radio stations.

In Great Britain, Reuters, the chief news agency, announced that the Australian Associated Press and the New Zealand Press Association would become partners in Reuters along with United Kingdom newspapers. The American military government in Germany licensed Dana, a news agency, and transferred it to the ownership of forty-one newspapers.

American newspapers announced plans for new buildings and equipment totalling \$250,000,000 but long delays were expected in construction and installation.

An interesting innovation was the opening of the press institute for working newsmen at Columbia University. Courses for editors, news editors, reporters in several specialized fields were offered and some of the best known men in the newspaper world attended these seminars. The Institute was regarded as a significant contribution to the professional side of newspaper making.

Among distinguished newspaper men who died in the year were Joseph M. Patterson, creator and publisher of the New York *Daily News*, George Dealey, publisher of the *Dallas News*, W. T. Dewart, Jr., of the New York *Sun*, Damon Runyon, writer, and Senator Carter Glass, publisher of the *Lynchburg, Va., News*.

CHARLES McD. PUCKETTE.

**NEW ZEALAND.** A British Dominion in the South Pacific Ocean, consisting chiefly of two large islands about 1,200 miles east of the southeastern coast of Australia. The Dominion has jurisdiction over Western Samoa (a League of Nations mandate in transition to United Nations trusteeship), the Tokelau or Union Islands, some islands of Oceania and the Ross Dependency. Area, 103,723 square miles. Population (1945 census), 1,746,319, including 97,263 Maoris. Capital, Wellington.

**The People.** The accelerated urbanization of the population and the relatively high Maori increase were the principal changes shown by the census of 1945. The Maori population, which amounted to 97,263 out of the total of 1,746,319, showed an 18.1 percent increase over 1936, as compared with an increase of 11 percent for the whole. The urban population was 63.1 percent in 1945, as compared with 59.3 percent in the earlier census. In 1944 the birth rate was 21.6 per 1,000, the death rate 9.9, and infant mortality stood at the strikingly low point of 30.1 per 1,000.

Primary education in New Zealand is free and compulsory. The number of schools at all levels is large, and the four colleges of the University of New Zealand had an attendance of 7,730 in 1944. New Zealand has an extensive social security system which began in 1898 with old age pensions and is therefore the oldest in the British Commonwealth. Latest available figures show religious affiliations as follows. Church of England, 40 percent, Presbyterian, 23 percent, Roman Catholic, 13 percent, and the remainder scattered.

**Government.** Executive power is vested in a Governor-General, appointed by the Crown for five years on recommendation of the Dominion Government. Legislative power rests with a Parliament of two chambers: the Legislative Council with an indeterminate number of members (usually over 30), appointed by the Governor-General for 7 years, and the House of Representatives of 80 members, including four Maoris, elected every three years by general male and female suffrage. There is a Cabinet and Prime Minister responsible to the House of Representatives. Prime Minister, Peter Fraser, Labor.

Lieut. Gen. Sir Bernard Freyberg was given popular demonstrations of welcome in Wellington when he was sworn in as Governor-General on June 17, in recognition of his being the first New Zealander to fill the post and in acknowledgment of his unusual war record with the New Zealand troops. Earlier in the year the first two women were appointed to the Legislative Council.

**Events, 1946.** The Labor Government, elected for the first time in 1935, was returned to office for its fourth term in the general election held on November 27, but with a slightly reduced majority. Labor won 43 seats and the National Party 37, while in the previous Parliament Labor had 44 and the National Party 35, with one seat vacant because of the death of an independent who voted with Labor. It was believed that the Labor victory might have been doubtful if in 1945 the Government had not abolished the "country quota," which for more than 50 years had given a greater proportionate representation to rural areas than to urban.

By December 20 the Cabinet was partly reconstructed, with the filling of vacancies which arose from reasons of health. E. L. Cullen, a farmer, was assigned to the Ministry of Agriculture and Marketing, and former Federation of Labor president McLagan to the Ministry of Labor, Mines and Employment.

**Western Samoa Trusteeship.** Discussion of New Zealand's draft agreement for trusteeship of Western Samoa, for which the country held a League of Nations mandate, began in a subcommittee of the United Nations General Assembly in New York on November 15. This agreement, one of eight submitted for first consideration at this time, was selected as a desirable basis for ascertaining the area of agreement among the members of the committee. The security provisions of the draft, which would permit New Zealand to fortify the islands—action which was forbidden under League of Nations mandate—were defended by C. G. R. Mackay, New Zealand Secretary of Island Territories.

The draft agreement received the detailed criticism which was anticipated for the first considered, and New Zealand patience wore thin. Sir Carl A. Berendsen of the New Zealand delegation warned the subcommittee that if there was a serious difference of opinion, New Zealand and Samoa would continue the League of Nations mandate. The New Zealand point of view with respect to its right to accept amendments was supported by United States representative John F. Dulles, who argued that otherwise the trusteeship system was in danger of being talked to death. This point of view was in line with New Zealand's protests against filibustering tactics at the sessions of the Paris Peace Conference.

New Zealand, with Australia, Soviet Russia, and Liberia, declined to sign the Bretton Woods Agreements by the deadline of December 31, 1946. Opposition in the House of Representatives was based on disapproval of the power of the dollar bloc in the International Monetary Fund and the International Bank for Reconstruction and Development, with (it was held) accompanying domination over countries which preferred links with the pound sterling.

**Relations with the United States.** Lend-lease and mutual aid obligations were settled by New Zealand and the United States in July, with no cash settlement. New Zealand agreed to buy American surplus war property, consisting of capital equipment and non-combat aircraft in the Pacific area, for \$5,500,000. The United States expected to use the money to acquire real estate and construct American government buildings in New Zealand. On December 3 the signing of a bilateral air transport agreement between New Zealand and the United States was announced in Washington, together with an identical agreement between Australia and the United States.

There was considerable popular support for the Auckland dock workers' refusal in July to load a shipment of 10,000,000 pounds of butter for the United States. Union president Barnes said in a public statement that it was impossible to reconcile sending the butter to the United States, where there was no rationing, with the world food situation. After explanation by Prime Minister Fraser that New Zealand, which had sold the whole of its exportable butter supply to Great Britain, was acting simply as the agent of the British Government, the protests subsided.

**Relations with Britain.** The terms of the revision of the 1944 bulk-purchasing agreement between New Zealand and Great Britain, as announced by Finance Minister Walter Nash in September, were bound to supply a base for the Dominion's economy until the expiration in 1950. The contract provided for Britain's buying the whole of New Zealand's exportable surplus of meat, butter, cheese and dairy produce. Since separate planned marketing arrangements had already been made for wool,

the greater part of the country's trade was guaranteed a market for the whole of its production. In addition, the farmer was insulated against sudden rises and falls on world markets.

The revision of the agreement raised prices above those previously paid, and provided that new price arrangements should be made annually. All payments from the sales to Britain are put in stabilization accounts, from which farmers draw a standard guaranteed rate for their produce, based on costs of production and an agreed profit margin rather than on British payments or world prices. In 1946 the stabilization funds were in such good condition that farmers could be paid at ruling rates for several years, even if world markets should collapse.

**Employment and Immigration.** With the passage of the employment bill early in the year New Zealand's reconversion plans were well on the way to completion. They included long-term public works and housing projects, stimulation of secondary industries through the foreign trade controls set up in the exchange crisis of 1938, creation of a system of government employment agencies, and maintenance of purchasing power by the establishment of a family minimum income.

The House of Representatives Select Committee on Population, which reported in September, decided against recommending an immediate large-scale scheme of assisted immigration. Instead it endorsed a selective scheme under which immigrants would be chosen to fill specific shortages in New Zealand.

The Committee believed that immigration of agricultural workers was unnecessary, as an expected settlement on the land of 8,000 ex-service workers would meet the farm needs, but desired that the Government should give attention to such occupations as those of hospital nurses, domestic workers, coal miners, saw millers, and operatives for certain expanding secondary industries. British immigrants were preferred, but since it was likely that Britain would not wish to lose many young, able-bodied citizens, it was recommended that inquiries be made of Norway, Denmark, the Netherlands and perhaps Poland.

All large bodies of troops serving overseas were repatriated by the end of the year. Plans for rehabilitation were made early, under the Rehabilitation Act of 1941. Loans were granted for land settlement, in amounts up to \$16,000 for ordinary farms and up to \$20,000 for sheep farms. Loans of about \$77,000,000 had been made up to November, 1946, out of an authorized total of \$103,000,000, exclusive of gratuity payments. It was required that one-half of the houses built by the Government should be allotted to veterans.

**The Economy.** In spite of the rapid expansion of manufacturing, New Zealand's economic system continues to rest upon agriculture as a source of valuable exports. In 1944 all of the chief exports were of this class, with butter (£18,560,951), wool (£12,711,407), and lamb (£9,643,671) leading the list. The only important non-agricultural export was gold (£1,423,556) which was placed far down on the list. Total exports of £77,786,946 were less than imports (£86,686,531).

ALZADA COMSTOCK.

**NICARAGUA.** A Central American republic. Area: 57,143 square miles. Population: 1,030,700 (1942). Capital: Managua.

Nicaragua's eastern and western lowland regions are separated by a highland area of from 5,000 to 7,000 feet elevation sloping gradually toward the

southeast. The low coastal lands of the east have a wet tropical climate, while the northwestern lowland area has the driest weather. Temperature to cool weather is found in the highland regions, varying according to altitude.

**Population.** Eighty percent of the total population of Nicaragua are mestizos: 13 percent are of European descent; 2 percent are Negroes, and 5 percent Indians. Highest regional density of population is in the western lowlands. The chief cities are: Managua, 100,717; León, 35,485; and Granada, 25,530 (1941 est.). The largest foreign colony is Honduran.

Spanish is the official language of the country. Roman Catholicism is the predominant religion.

About 37 percent of the total population is estimated to be literate. In 1945 there were 774 primary schools with a total enrollment of 61,000. In 1945 there were 30 intermediate schools with a total registration of 2,000, and 413 students were enrolled in schools of higher education. There are 3 universities. Fifty-eight rural schools were opened in 1944, reaching a total of 645 in 1945 to provide instruction for over 33,000 children.

**National Economy.** Nicaragua's economy is agricultural. Coffee is the most important crop, with sesame seed ranking second. Sugar, rice, cotton, corn, beans, and bananas are also important crops. Livestock-raising is one of the principal occupations; there are an estimated 800,000 head of cattle in the country. Nicaragua also produces important forest products.

Gold and silver are practically the only minerals mined in Nicaragua. In 1944, gold production amounted to 219,579.1 troy ounces; silver, to 254,457.2 troy ounces.

There is little manufacturing. Small establishments make such articles as cigarettes, matches, beer, cement, leather shoes, furniture, and cotton textiles.

**Foreign Trade.** The value of the foreign trade of Nicaragua in 1945 was estimated at \$26,000,000 of which imports constituted \$12,000,000 and exports \$13,000,000. In that year gold exports were \$7,100,000; coffee \$3,600,000; rubber, \$846,000; lumber, \$688,000; sesame seed, \$361,000, sugar, \$325,000. The United States was the principal market, receiving about 90% of the total exports. Costa Rica ranked second as an export market, Panama third, Peru fourth, and Honduras and Great Britain fifth.

Leading imports in 1945 were estimated at: textiles, \$2,000,000; machinery, vehicles, \$1,900,000; chemicals, \$1,067,000; foodstuffs, \$1,200,000; petroleum \$811,355; iron and steel products \$800,000, and paper products, \$264,000. The United States was the chief source of Nicaraguan imports, supplying 70% of the total. Mexico ranked second, followed by Canada, Panama and Costa Rica.

**Government.** Under the Constitution of 1939, Nicaragua has a bicameral Congress: a Senate of 15 members and a Chamber of Deputies of 40. There is a Cabinet of 9 members. All former presidents who were elected directly may sit as members of the Senate. The present Congress was formed by the division into two chambers of the Constituent Assembly elected in 1938, and it is to serve until Apr. 15, 1947. Anastasio Somoza became President in 1937 for a 4-year term which was extended in 1939 for 6 years as the result of adoption of the new Constitution.

**Events, 1946.** The political year opened on January 7 with President-General Anastasio Somoza telling a gathering of 2,000 district political leaders that he would not be eligible for another Presiden-

tial nomination. President Somoza, whose term expired on January 1, 1947, later told reporters that "the office of Presidency has a bitter taste I believe [the people] are getting bored with me." At the end of January minor demonstrations cropped up in Managua and the Cabinet resigned. A possible Presidential candidate was seen in the resignation of Dr. Mariano Arguello, Foreign Minister for ten years and chairman of the Nicaraguan delegation to the United Nations San Francisco Conference.

After a report was printed in United States newspapers concerning anti-Somoza demonstrations in Managua, Dr. Guillermo Sevilla Sacasa, Nicaraguan Ambassador in Washington, declared on February 3 that the reports of disorders were untrue and that political parties carried on meetings "with all the liberties expected by the organizers and granted by the Government." In mid-February the Nicaraguan Confederation of Labor announced it would not participate in the Presidential elections scheduled for February, 1947.

During the Congressional sessions in March Senator Arguello Vargas was elected President of the Congress, but later resigned to become a Presidential candidate.

President Somoza's National Liberal party held its nominating convention on August 12 at León. When Somoza-sponsored Dr. Lorenzo Guerrero failed to get a necessary two-thirds majority, President Somoza submitted Dr. Leonardo Arguella. Arguella was unanimously approved by the convention.

On September 1 the opposition Independent Liberals, with the Conservatives, selected Dr. Enoc Aguado as their Presidential candidate.

After being assured of Dr. Arguello's nomination, President Somoza immediately flew by plane to the United States for an emergency surgical operation.

A law authorizing all Nicaraguans to occupy and acquire free tracts of uncultivated Government lands up to twenty-five hectares was passed by Congress on November 16. Heads of families were permitted to acquire 50 hectares. If within two years after the acquisition at least four hectares have not been cultivated, title to the land will lapse.

In preparation for any possible vacancy in the Presidency, Congress on December 21 named Deputy Benjamin Lacayo, Deputy Carlos A. Bendava, and Senator Nofre Sandoval as the three Presidential designates eligible for succession.

Nicaragua closed the year with her economic situation in good condition, a balanced budget and a favorable balance of trade. Because of a curtailment in road construction, unemployment was in evidence for the first time in ten years. As new machinery was obtained, it was expected that exports of gold, lumber, bananas, hides, and oils would increase. The Government was considering a loan, negotiated through the National Bank of several million dollars to assist coffee growers.

JOSEPH P. BLANK.

**NIGERIA.** A large colony and protectorate in British West Africa, including for administrative and statistical purposes the Cameroons under British mandate. Area of the whole, 372,674 square miles. Population (1943 estimate), 21,329,328. Capital, Lagos.

**Government.** Administration is in the hands of a Governor, assisted by an Executive Council and a Legislative Council of not more than 30 official members and 21 elected or appointed members

to represent business and native interests. The Legislative Council enacts laws for all regions of the colony and protectorate except the northern provinces, for which the Governor enacts the laws.

The Governor is a member of the West African Council. Nigerian currency is controlled by the West African Currency Board. Large grants from the British Colonial Development and Welfare Fund have been made to Nigeria, which has a 10-year plan costing £55,000,000.

**Production and Trade.** The products of the large area are diverse in character, and include agricultural and forest products, gold, tin, and a variety of other minerals. Palm kernels, palm oil, cocoa, groundnuts, hides, and skins are important exports. Cotton piece goods are usually the leading import, but iron and steel manufactures are also required in volume. Exports customarily exceed imports in value.

**The People.** Conditions of life vary from the almost European circumstances of Lagos to primitive conditions in the north. This situation provided a puzzling factor in the demands for a 50 percent increase in cost-of-living allowance put before the British Colonial Secretary by the Nigerian trade unions in October. The report of the commission of inquiry contained a cost-of-living index compiled by Lagos in the manner of the British Ministry of Labor, but recommendations must be applicable to areas where wife-purchase costs were factors in the rising cost of living. The Colonial Secretary approved the increase.

Primitive areas have in general retained ancestral religions, but Christianity and Mohammedanism have many adherents. Education has made slow progress, except in the Christian areas. Only about one-seventh of the children of school age are in primary or secondary schools.

ALZADA COMSTOCK.

**NOBEL PRIZES.** For the first time in the history of Nobel Prizes, four of the five awards were given to nationals of a single country as seven Americans won the prizes in medicine, peace, physics and chemistry, and a naturalized Swiss citizen won the literature prize.

The Nobel Prize in medicine and physiology, worth about \$34,000, was awarded, on October 31, to Prof. Herman J. Muller, geneticist and member of the faculty of Indiana University at Bloomington, Indiana. The Nobel committee, which made the award from the Caroline Institute Medical College in Stockholm, announced that Prof. Muller was given the award for his revolutionary discoveries regarding hereditary changes or mutations produced by X-rays striking the genes and chromosomes of living cells.

Announcement of the other prizes, all worth 121,000 kroner or about \$33,700, was made on November 14. The peace prize was divided between Miss Emily Greene Balch of Wellesley, Massachusetts, economist and worker in international women's organizations, and Dr. John R. Mott of Orlando, Florida, a Young Men's Christian Association official who aided in the founding of five world federations. Miss Balch, former faculty member of Wellesley College, was honorary international president of the Women's International League for Peace and Freedom. Dr. Mott, as president of the World Alliance of Young Men's Christian Associations, went to Germany in February, 1946 to help German Young Men's Christian Association organizations fight the rising number of juvenile delinquency cases. He has helped to develop the Student Volunteer Movement, the World Stu-

dent Christian Federation, the World Young Men's Christian Association, the International Missionary Council and the World Council of Churches.

One half of the chemistry prize was awarded to Prof. James Batcheller Sumner of Cornell University for his research in enzymes, and the other half was shared by Prof. Wendell M. Stanley and Prof. John Howard Northrop, both of the Rockefeller Institute for Medical Research, Princeton, New Jersey, for their achievements in preparing enzymes and virus proteins in pure form. Prof. J. B. Sumner first isolated the enzyme in 1926. The three men unveiled the mystery from enzymes and viruses by discovering that they were chemical compounds, thus enabling chemists to study them along chemical lines.

Prof. Percy Williams Bridgman of Harvard University was awarded the physics prize for his invention of apparatus producing extremely high pressures, and for studies within the sphere of high-pressure physics. In creating pressures as high as 750,000 pounds to the inch, he has been able to show much of the fundamental nature of the world and has created such anomalies as ice that resists boiling water, rubber that turns brittle and ordinary chemical compounds that suddenly transform into high explosives.

The literature prize went to Hermann Hesse, German-born novelist, who became a Swiss citizen in 1912. Most of his books have been translated into Scandinavian and Slavic languages, but only two—*Steppenwolf* and *Death and the Lover*—have been translated into English.

The Nobel Prize fund of \$9,000,000 was established by will of Alfred Bernhard Nobel, Swedish inventor of dynamite, who died in 1896.

**NORTH AMERICA.** Excluding Mexico and Central America, but including Greenland, Newfoundland, and smaller adjacent islands, the continent has an area of about 7,591,498 square miles (19,662,000 square kilometers) and a population estimated at 143,178,000 on Jan. 1, 1940. The combined area of Mexico, Central America, and the West Indian islands was about 1,073,080 square miles and the population about 40,870,000.

**NORWAY.** A European kingdom occupying the western and northern part of the Scandinavian peninsula. Capital, Oslo. King, Haakon VII, who was born in 1872 and was elected to the throne by the Storting (parliament) Nov. 18, 1905. Norway holds sovereignty over Svalbard (Spitsbergen and adjacent islands) in the Arctic Sea, 240 miles distant from the Norwegian coast (see *SVALBARD*); Norway also asserts sovereignty over uninhabited Jan Mayen Island in the Arctic Sea, and certain uninhabited areas in the Antarctic.

**Area and Population.** Covering an area of 124,556 square miles (land area, 119,148 square miles), Norway proper had 2,952,000 inhabitants on Jan. 1, 1941, by official estimate; by latest census, 2,814,194 in 1930. Only 28 per cent of the population of 1930 were classed as urban, and females exceeded males by about 71,000. The birth rate, per 1,000, was 16.3 for 1940 (15.9 for 1939); death rate, 10.9 (10.2). Populations of chief cities: Oslo, 268,606 in 1943; Bergen, 106,500 in 1938; Trondheim, 54,458 in 1930; Stavanger, 46,780 in 1930.

**Production.** In normal times 29 per cent of the workers followed agriculture or forestry, 27 industry, 10 commerce, 9 transportation, 7 fishing and whaling, 5 professions and public administration. Under German rule, all economic resources and productive facilities were coordinated as far as pos-

sible with the requirements of the Nazi war machine. Production (metric tons) of chief crops in 1944 were: wheat, 235,719; barley, 262,792; oats, 744,767; rye, 18,613; mixed corn, 48,864; potatoes (bushels) 31,905,029; hay (tons) 2,113,921. The value of ore production in 1943 was 49,574,000 kroner, with pyrites and iron ore accounting for a large majority of the total. Estimated mineral and metallurgical production in 1943 was (in metric tons): iron ore, 285,191; pig iron, 47,687; pyrites, 808,779; zinc and lead, 9,075; copper, 21,216; aluminum, 23,514; ferro-alloys, 97,168. On January 1, 1946, the merchant marine consisted of 1,464 vessels with a gross tonnage of 2,979,850. Manufacturing is confined chiefly to the processing of wood, fish, and minerals.

**Foreign Trade.** Imports in 1945 were estimated at 1,206,338,000 kroner, exports at 328,018,000 kroner.

**Government.** Under the Constitution of 1814, as subsequently amended, executive power is vested in the King, acting through a Cabinet responsible to the Storting. The Storting consists of 150 members elected for four years by universal suffrage. It divides itself into two sections of 38 and 112, called the Lagting and Odelsting, respectively. In the elections for the Storting held on October 8, 1945, the following parties were elected: Labour, 76; Conservative, 25; Liberal, 20; Communist, 11; Agrarian, 10; and Christian People's, 8.

Norway was invaded by German armed forces on April 9, 1940, and remained almost wholly occupied until May 8, 1945. For the German administration of Norway during that period and the puppet regime of Vidkun Quisling, see *YEAR BOOK* for 1944, p. 452.

**Events.** Norway, in 1946, presented a picture unique in Europe, and indeed in the world: a picture of perfect political stability, of quick economic recovery, of labor peace, and of smooth relations with foreign countries.

On the political scene, nothing worth mentioning happened. With an absolute majority in the Storting, and little active opposition from any quarter, the Labor Cabinet of the young and competent Premier Einar Gerhardsen was able to work practically undisturbed. The only change in the composition of the Government occurred early in February as a result of Foreign Minister Trygve Lie's resignation, necessitated by his election to the post of Secretary General of the United Nations. Halvard M. Lange, 43, a prominent member of the former Resistance, was picked to succeed him.

On several occasions during the year, the Norwegian Government reaffirmed, or demonstrated in practice, its determination not to allow itself to be drawn into any controversy or conflict between the great powers, but to remain on the best possible terms with all of them.

A minor, but significant, episode which occurred in the spring might be cited in evidence of this attitude. In January King Haakon invited the former British Prime Minister Winston Churchill to attend the celebration of Norway's national holiday, on May 17; the British statesman accepted. After Churchill's aggressive anti-Russian speech in March, however, the Norwegian Cabinet decided that Churchill's visit was not desirable at this time since it might be looked upon with disfavor by Moscow. Reluctantly, but conscious of his duty as a constitutional monarch, the King bowed to the will of his Cabinet and the invitation was withdrawn.

Possibly in connection with this incident, the impression developed in some circles that Norway

was becoming a Soviet satellite. A report from the Paris Peace Conference in August stated that some diplomats there expected Norway to "vote the straight Russian ticket" in major conference problems. Norwegian delegates immediately rejected this insinuation as unfair and their attitude at the Conference was one of absolute impartiality.

On Oct. 6, Foreign Minister Lange stated once more that Norway would not join "any bloc of nations," and would not allow herself to be drawn into "any sphere of influence." He told interviewers that his country instead would try "within the limits of a small nation" to act as "a connecting link" between Russia and the Western world.

**Toward Peacetime Prosperity.** All the more important developments of the year were in the economic field. Excellent progress was made in all branches of production, through a skilful combination of government planning and private enterprise.

In March, a so-called "National Budget" was made public, a blueprint for a five-year reconstruction program, which placed the emphasis on a heavy increase in the means of production, in preference to an immediate rise in the standard of living.

Anticipating a steady rise in the national income from 4,200,000,000 Kr. in 1946 to 5,100,000,000 by 1950, the National Budget envisages a yearly import surplus of from 800,000,000 to 1,000,000,000 Kroner, which is to be met through foreign loans. The imports financed by these loans, however, are to be used only for reconstruction purposes and for new investments in production capital, not to supply consumer demands as in the past.

The Budget evidently was designed to mark the inception of an intense phase in the development of Norwegian industry, with sizable state investments in a number of key industries. This policy was based to a considerable extent on the fact that the Germans, during the five years of occupation, had built in Norway a number of huge industrial plants which were now taken over by the state. The largest of these formerly enemy-owned assets was the Nordag aluminum combine, representing a German investment of 900,000,000 Kr.

In August, the Storting by a vote of 102 to 42 authorized the Government to undertake the construction of a modern electro-iron works at Mo-i-Rana (Nordland province), described as the largest single industrial venture in Norwegian history. With ample ore deposits, and abundant electric power of her own, Norway, before the war, imported about 90 per cent of her annual requirements of 300,000 tons of iron and steel. The new plant is expected to supply 200,000 tons of rolled iron products yearly. The large-scale development of Norway's water-power resources, begun by the Germans, will also be continued under Norwegian state control, according to the National Budget plan. Controlling interest in the gigantic electrochemical concern, Norsk Hydro, which formerly was French-owned, passed to the Norwegian state as a result of a wartime deal between Nazi Germany and Vichy France and the subsequent seizure of German assets in Norway. Negotiations with France for an equitable settlement were in progress toward the end of the year.

The index of industrial production reached pre-war levels in mid-summer and continued to progress. Unemployment figures hit an all-time low on June 30, with 6,400 registered unemployed, against 15,200 available jobs.

Very satisfactory progress was also achieved in the rehabilitation of Norway's important merchant marine. By April 1, 1,450,000 gross tons of new

merchant shipping had been ordered from Swedish, Danish, and other shipyards, for delivery within five years. Tonnage increase in 1946 was estimated at 580,000 gross tons, and Norway's merchant fleet, which had been reduced by one-half during the war, was expected to reach its prewar size by the end of 1950.

**Peace on the Labor Front.** In an address to the Norwegian Trade Union Congress in Oslo, late in May, Premier Gerhardsen said: "When the labor movement has the political power, as it has in Norway today, all of its members must be aware of the great responsibility entailed. The reconstruction of homes, industry, and the standard of living will be the great tests we shall be called upon to meet."

Norwegian labor responded to the appeal of its leaders by maintaining a perfect record of industrial peace throughout the year. Although in April basic collective bargaining agreements covering more than 200,000 Norwegian laborers came up for renegotiation for the first time in nearly ten years, no major strikes occurred. Differences over pay increases, which arose in a number of industries, were settled by the State Wage Board, without disturbances. In October, a nation-wide overtime production drive got under way, sponsored by the Government and endorsed by the labor unions, to speed the rehabilitation of war-ravaged areas.

**The Purge.** The prosecution of Nazi war criminals and quislings gathered momentum during the year, in contrast with the trend apparent in some other countries. In May, two of Vidkun Quisling's principal henchmen, former Minister of the Interior William Hagelin and former Minister of Education Ragnar Skancke, paid the supreme penalty for treason.

Mrs. Maria Quisling, widow of the executed Nazi leader, was acquitted of charges of collaboration on June 17. On the other hand, Mrs. Anne-Marie Hamsun, wife of the famous writer Knut Hamsun, on August 27 was sentenced to three years at hard labor for collaboration with the enemy. Her 86-year-old husband had previously been committed to an institution for the aged, after the State's case against him had been dropped on the ground of senility. Still another prominent personality, Henry Johansen, husband of the Metropolitan Opera star Kirsten Flagstad, died in Oslo prison in June; he was accused of having made huge war profits under the German regime.

The biggest mass trial in Norwegian legal history was held at Trondheim during the summer. It ended on September 20 with death sentences for eleven members of a Nazi terrorist gang, while nineteen others received varying prison terms. In a summary of current proceedings, Attorney General Sven Arntzen indicated early in July that 200 death sentences might be expected before the war-treason and war-crimes trials in Norway are concluded. He estimated that about 60,000 persons would be subjected to court action, including a large number of Germans.

JOACHIM JOESTEN.

**NORWEGIAN LITERATURE AND ARTS.\*** In the field of magazine publishing a new contribution is the women's magazine *Kvinnen og Tiden* (*The Woman and The Times*) representing the continuation of an underground publication. It is already playing a central role in discussions concerning problems of the modern woman. The magazine is edited by Kirsten Hansteen, Norway's first woman cabinet

\* From an article by Dr. Nic Stang, University of Oslo. Translated and revised by Ivan A. Jacobsen.

member and widow of Viggo Hansteen, the first Norwegian to be executed by the Nazis. Young intellectual prisoners set up the periodical *Ungdom* (*Youth*) following liberation, but despite its circulation of over 15,000 it was forced to turn to the public in 1946 for additional support. Norway's only art periodical, the very representative *Kunst og Kultur* (*Art and Culture*), edited by Dr. Harry Fett, appeared in the fall of 1946. It can be safely said that *Samtiden* (*Our Times*) under the editorship of Prof. A. H. Winsnes is still the country's leading periodical. But the deeply conservative and strongly anti-Russian *Farmand* (*The Traveler*) is playing an amazingly strong role the country over. Dr. Trygve B. Hoff has managed to gather about him all those who are dissatisfied with the general trend toward a more State-directed economy. Otherwise, the Communists have set up their own periodical *Vaar Vei* (*Our Way*). In the spring of 1946 a broadly-based socialistic weekly edited by Torolf Elster made its appearance. The publication is carrying on the tradition of *Haandslag* (*Hand Clasp*) which was printed in Sweden during the war.

Norwegian literary contributions have been confined, by and large, to descriptions of what took place in occupied Norway, but the so called "outer front" has also strongly asserted itself in print. A host of the known Norwegians who participated in information activities abroad, whether addressing themselves to the world or to the Norwegian home front, have now published their speeches and articles. Among these may be noted Parliamentary President C. J. Hambro, Professors Jacob S. Worm-Müller and Wilhelm Keilhau, chief of Norwegian Broadcasting in London, Toralf Oeksnevad, and many others. Books of Norway's war contribution abroad, from Africa to the Arctic Ocean, have also begun to appear. But here, the books concerned are of the straight-reporting type with interest confined to a relatively limited period. Two exceptions may be found in the publications of Max Manus, one of Norway's most able saboteurs: *Det Vil Helst Gaa Godt* (*It Usually Works*) and *Det Blir Alvor* (*This Is For Keeps*). The semi-official book describing the Norwegian-English sabotage group, *Kompani Linje*, is another excellent example of this type of literature. In the same group may be included the semi-official publication on Grini, Norway's largest concentration camp where some 20,000 Norwegians were confined during the occupation. Another book of unquestionable value is Hans Cappelen's pure documentation from a German *Nacht und Nebel* camp.

The overwhelming amount of "occupation literature" presents a wide scene. Norway's number one humanist prisoner, Professor Francis Bull, has published some of the gentle yet forceful talks which he gave to his fellow prisoners. His *Tradisjoner og Minner* (*Traditions and Reminiscences*) written on toilet paper in his solitary cell is a work which will live on in Norwegian memoir literature. Norway's outstanding painter Per Krohg has also printed the unpretentious and sensitive little talks on art which he held in the prison barracks.

While as many as eighty or ninety novels or romantic portrayals from the occupation, dealing mainly with sabotage action have appeared in Denmark, this type of literature is very scarce in Norway. A journalist, Sigurd Evensmo, was the one out of eighteen who by sheer accident avoided being executed, and instead was freed after two years in prison. On the basis of what he had experienced, he wrote *Englandsfarere* (*England-farers*)—which has subsequently been filmed.

While Sigurd Evensmo's novel is easily approached and appeals to the average individual, Tarjei Vesaas has written a novel which makes heavy demands upon the reader. Following a career as an author with eighteen novels to his credit, he has made his great breakthrough with *Huset i Mørket* (*The House in The Gloom*) which was published after the war. Through this massive, frightening work he has described what it means to live in a conquered and ravaged land.

A distinctive work has been created by Johan Falkberget, another of the older writers, the bard of mine and mountain. Up to the present, his great work has been *Christianus Sextus* a series portraying the history of the ancient Røros mines. In the first two volumes of his new trilogy *Nattens Brød* (*Bread of the Night*) he has created his own world, a world in which one can believe as fully as in all else believed to be so.

The first postwar theater season in Oslo has tended to show that only in the case of two theaters has there appeared the desire to improvise and to renovate. Det Norske Teatret opened its season with an excellent performance of Sophocles' *Antigone* with Thordis Maurstad in the leading role. Hans E. Kinck's gloom-permeated and trollish middle-age novel *Mot Ballade* (*Toward the Ballad*) provided the foundation for a remarkable dance sketch. The Theater came into being during the occupation, coagulating about a small circle of young and enthusiastic actors who were striving determinedly to perfect their style according to the system of their great "prophet" Stanislawski. Their leader was the distinctive and inaccessible lyricist Claes Gill who performed a great work during his one year as leader of this small experimental group. It has shown a unique daring, both regarding presentation and choice of stock, and substitutes for the theater school which is still lacking in Norway. Here again, the repertoire has run the gamut from Leonid Leonov's *Invasjon* (*Invasion*) to Arthur Koestler's *Skumringsbaren* (*Twilight Bar*) and the experience has had a new and reassuring effect on a public viewing an experimental theater for the first time in many years.

Graphic arts have retained a high level. When the artists met for their first large gathering following liberation, it was soon clear that nothing basically new had happened. The great manifestation of the intermediate generation's achievements will be the Oslo City Hall, where Alf Rolfsen's great fresco already appears in the foyer and where the works of Axel Revold, Per Krohg, Aage Storstein and Henrik Sørensen are nearing completion in the different chambers.

Among the younger generation, those names which had earlier achieved a fast position stand equally secure today. Kaj Fjell is painting the luxuriant and detail-rich canvasses for which he is known. Young Victor Smith is identified with the religious visionary school. Two other young painters, Alf Jørgen Aas and Else Hagen, can be said to have "arrived" since the war. The huge passion-filled canvasses of Arne Ekeland show a powerful feeling.

Among the more gratifying experiences since the war is the discovery of a vast amount of talent among the young artists who attended the illegal academy under the able guidance of Stinius Fredriksen and Per Palle Storm. Thanks to the many war monuments to be erected, there will be employment opportunities never before available to Norwegian sculptors—and it now appears that the necessary talent is ready and waiting. Gustav Janson is a third sculptor belonging to this group. Both

Josef Grimeland and Niels Flakstad had secured a good standing even before the war, and since liberation have won a number of competitions. Among Norway's very youngest sculptors Kjell Rasmussen has shown a remarkable assurance in the few pieces he has turned out to date.

During the latter portion of the occupation, Norwegian music carried on an underground existence. Creative artists and composers were strongly influenced by the patriotic drive and—like Grieg—drew heavily on Norwegian folk music sources for inspiration from which to fashion their own personal styles. Outstanding among these are Harald Saeverud and Klaus Egge. Saeverud's feeling for folk melody is so strong that he might be said to create his own folk themes. His outstanding works are *Sinfonia Dolorosa*, written in memory of a friend who fell during the war, and *Kjempevises-laatten*. The composition style of Klaus Egge is based directly on the music of the curious Hardanger Fiddle, but his tonal impressions are completely modern and provide a broad area for polyphonic development. His most important compositions are *Trio for Violin, Cello, and Piano*, and *Symphony No. 1*—both of which were written during the war and clearly reflect the temperament of the period. Ludvig Irgens Jensen's first symphony as well as his patriotically inspired choral pieces and romances are worthy of mention.

**NUREMBERG TRIALS. Background.** The Trial of the leading German war criminals at Nuremberg was an outgrowth of the generally accepted desire of civilized peoples that those persons responsible for World War II should be punished. During the war the allied nations continually received evidence of atrocities, massacres and mass executions in those countries occupied by the Axis. On October 7, 1942, President Roosevelt said:

"It is our intention that just and sure punishment shall be meted out to the ringleaders responsible for the organized murder of thousands of innocent persons and the commission of atrocities which have violated every tenet of the Christian faith."

And on November 1, 1943, a joint statement issued at Moscow by President Roosevelt, Prime Minister Churchill, and Premier Stalin indicated that those German criminals whose offenses had no particular geographical locale would be punished by joint decision of the governments of the Allies.

A United Nations Commission for the Investigation of War Crimes was created and through its efforts began the process of gathering and checking evidence of crimes from all possible sources. Soon after the war in Europe ended, negotiations on the establishment of an International Military Tribunal for the trial of war criminals were begun in London by the United States, the then Provisional Government of the French Republic, the United Kingdom and the Soviet Union. By the Agreement of August 8, 1945, signed at London, the Charter defining the jurisdiction, functions and powers of the Tribunal and prescribing the procedure for conduct of the trial became the cornerstone of this experiment in international criminal law.

In accordance with Article 5 of that Charter, the following governments of the United Nations have so far expressed their adherence to the Agreement and Charter of August 8, 1945: Greece, Denmark, Yugoslavia, the Netherlands, Czechoslovakia, Poland, Belgium, Ethiopia, Australia, Honduras, Norway, Panama, Luxembourg, Haiti, New Zealand, India, Venezuela, Uruguay, and Paraguay.

Pursuant to the Charter, each signatory nation

appointed a Judge and an Alternate. The United States appointed former Attorney General Biddle as Judge and John J. Parker, Senior Federal Circuit Judge for the 3rd Circuit Court as Alternate; the United Kingdom appointed Lord Justice Lawrence of the Court of Appeals as Judge and Sir Norman Birkett as Alternate, the French Republic appointed Professor Donnedieu de Vabres as Judge and Justice Robert Falco of the Court of Cassation as Alternate; and the Soviet Union selected Major General I. T. Nikitchenko of the Red Army as Judge and Lt. Colonel Volchikov of the Red Army as Alternate. These Members and Alternates assembled in Berlin in October 1945 to prepare rules of procedure for the conduct of the trial. Lord Justice Lawrence was elected President of the Tribunal.

On October 18, 1945, the Committee of Chief Prosecutors, consisting of Robert H. Jackson of the Supreme Court of the United States acting on behalf of the United States, François de Menthon, Minister of Justice acting on behalf of the French Republic, Attorney General Hartley Shawcross acting on behalf of the United Kingdom, and General R. A. Rudenko acting on behalf of the Union of Soviet Socialist Republics, lodged an indictment with the Tribunal against twenty-four individuals.

They were: Hermann Wilhelm Goering, Rudolf Hess, Joachim von Ribbentrop, Robert Ley, Wilhelm Keitel, Ernst Kaltenbrunner, Alfred Rosenberg, Hans Frank, Wilhelm Frick, Julius Streicher, Walter Funk, Hjalmer Schacht, Gustav Krupp von Bohlen and Halbach, Karl Donitz, Erich Raeder, Baldur von Schirach, Fritz Sauckel, Alfred Jodl, Martin Bormann, Franz von Papen, Artur Seyss-Inquart, Albert Speer, Constantin von Neurath and Hans Fritzsche.

The Charter also provided that at the trial of any individual member of any German group or organization, the Tribunal may declare that the group or organization of which that individual was a member is a criminal organization. The Committee of Chief Prosecutors also asked that the Tribunal declare criminal the following organizations:

*Die Reichsregierung* (Reich Cabinet); *Das Korps der Politischen Leiter der Nationalsozialistischen Deutschen Arbeiterpartei* (Leadership Corps of the Nazi Party); *Die Schutzstaffeln der Nationalsozialistischen Deutschen Arbeiterpartei* (commonly known as the "SS") and including *Die Sicherheitsdienst* (commonly known as the "SD"); *Die Geheime Staatspolizei* (Secret State Police, commonly known as the "Gestapo"); *Die Sturmabteilungen der N. S. D. A. P.* (commonly known as the "SA"); and the *General Staff and High Command of the German Armed Forces*.

The individual defendants were served with the indictment immediately. The defendant Robert Ley committed suicide in prison on October 25, 1945. Because of his physical and mental condition, the Tribunal decided that the defendant Gustav Krupp von Bollen could not be tried. On November 17, 1945, the Tribunal ruled it would try the defendant Martin Bormann *in absentia*, pursuant to Article 12 of the Charter.

**Mechanics of the Trial.** The actual trial itself began on November 20, 1945 at Nuremberg, Germany. Nuremberg, a city of 400,000 people before the war, had been almost totally destroyed by Allied bombing raids because of its importance as a communications center and also because of its propaganda value as the Nazi shrine. What remained of the medieval walled city was completely finished by Allied artillery aimed against an SS Division which had elected to make its final stand against American infantry within its walls. The trial was held in the reconstructed Court House.

The individual defendants were given counsel of their own choosing or, when they so requested,

were represented by counsel selected for them by the Tribunal. If they selected their own counsel these lawyers could be members of the Nazi Party, but the Tribunal selected only non-party members. Among those appointed by the Tribunal were several distinguished members of the German Bar in the days of the Weimar Republic, inactive during the Hitler regime. The indicted organizations were also represented by counsel.

The most difficult problem was the procurement of witnesses and documents. Unlike long-established courts in civilized and peaceful countries, the Tribunal was forced to create its own system for searching out and finding its witnesses and documents for the defense. Not only was the entire German communication system, such as telephone and telegraph, non-existent but there was in many areas no functioning local government at hand to locate such witnesses, many of whom had not been heard from for many years, or to produce requested documents. Without the aid of the occupation armies it would have been impossible to conduct the trial. After a witness was located, for instance, he had to be brought to Nuremberg with American Army escort and by Army transportation; the Army had to lodge and feed him in a devastated city already overcrowded with a floating German population and, when his usefulness to the trial was over, to return him once again to his own locality. It was necessary to procure secretaries, translators, and relevant law books for defense counsel.

The trial took place in four languages: English, French, Russian and German. The first extensive use of "simultaneous translation," the earphone system, cut the length of the trial immeasurably. Although this system of "simultaneous translation" had occasionally been used in the past by the League of Nations for long prepared speeches, this was the first time it had been attempted in the give-and-take atmosphere of the court room. Its success was immediate. A Russian lawyer, for instance, could ask in Russian a question of a French witness. The latter would immediately hear the question in French although the English judge heard it in English, and the German lawyer, because he heard the German translation, was equipped to make his legal objections immediately.

The differences in legal systems however were more pervasive and proved more difficult. The Charter itself had provided in general for certain rules which rules were a compromise between the Anglo-American and Continental systems of law. The differences between even English and American jurisprudence were often marked and, when compared with the French, Russian and German systems, the differences were acute. For example, the art of cross-examination, which is the touchstone of Anglo-American law is unknown to the French, Russians, and Germans, and the Continental habit of continual interrogation from the bench is equally unknown in American and English jurisprudence. But, through the acceptable process of trial-and-error, the judges, prosecution lawyers and defense counsel soon evolved a workable procedure accepted and understood on all sides.

The hearing of evidence and the speeches of counsel concluded on August 31, 1946, after ten months of sessions. The Tribunal held 403 public sessions and heard 33 prosecution witnesses against the individual defendants; 61 witnesses, in addition to 19 of the defendants, gave evidence for the defense. The defense also introduced interrogatories from 143 additional witnesses. Most prosecution evidence was documentary. The documents

had been captured in German Army Headquarters, German Government buildings, salt mines, Nazi castles and elsewhere. The authenticity of this evidence was never seriously questioned.

On September 30 and October 1, 1946, the Tribunal handed down its 300-page opinion. It found guilty all defendants except three and declared four of the seven indicted organizations to be criminal organizations.

According to Article 29 of the Charter, the Allied Control Council for Germany was charged with carrying out the sentences of the International Military Tribunal. The Control Council executed those defendants sentenced to death by hanging on October 16, 1946.

**The Opinion of the Tribunal. Aggressive War.** The defendants were indicted under Article 6 of the Charter which specified the international crimes of which the Tribunal had jurisdiction. Article 6(a) reads:

"Crimes against peace: Namely, planning, preparation, initiation, or waging of a war of aggression, or a war in violation of international treaties, agreements, or assurances, or participation in a common plan or conspiracy for the accomplishment of any of the foregoing"

Count One of the indictment listed the charges relating to the common plan or conspiracy to plan, prepare, initiate, and wage wars of aggression. Count Two listed the substantive crimes against peace,—the actual preparing and waging of these wars. Although some of the defendants were acquitted on the first count and convicted on the second count, the prosecution submitted the evidence on the two counts together and the opinion of the Tribunal also discussed both counts together. The opinion of the Tribunal first summarized and discussed the evidence as to aggressive war, during which it reached many conclusions and made numerous findings as to the facts. It then discussed the points of international law raised by the trial.

**The Facts.** After a resumé of the origin and aims of the Nazi Party, the Tribunal discussed its seizure and consolidation of power. Having come to power in 1933, the Party consolidated its holding on every phase of German life by creating the Gestapo, using concentration camps and abolishing other political parties and representative assemblies. The civil service was purged, trade unions were abolished, and the Jews driven out of the economic life of Germany. The jurisdiction of the courts was severely limited and the churches were attacked. The military was purged by the removal of conservative leaders and consolidation of the armed forces directly under Hitler himself. An air force was built and the German army expanded, as was the Navy, particularly the U-Boat arm, all contrary to the Versailles Treaty.

The first acts (not wars) of aggression charged by the indictment were the seizure of Austria and Czechoslovakia, the first war of aggression charged by the indictment was the war against Poland which began on September 1, 1939. Before reviewing these crimes against peace, the Tribunal stated:

"War is essentially an evil thing. Its consequences are not confined to the belligerent states alone, but affect the whole world. To initiate a war of aggression, therefore, is not only an international crime, it is the supreme international crime differing only from other war crimes in that it contains within itself the accumulated evil of the whole."

The Tribunal found on the evidence Hitler's purpose was to unite the German people in the consciousness of their destiny. To achieve this two things were essential: to disrupt the European

order as it existed under the Treaty of Versailles, and to create a greater Germany beyond the frontiers of 1914, which, of course, required seizing foreign territory. In its opinion, the Tribunal placed great emphasis on the captured notes of four secret meetings which Hitler held with his military leaders. These notes, said the Tribunal, made it clear beyond any doubt that the Nazis deliberately planned aggressive war.

These four meetings were held on November 5, 1937, and on May 23, August 22, and November 23 of 1939.

The meeting of November 5, 1937 (the so-called "Hoszbach Conference" because the notes were kept by Hitler's personal adjutant, Lt. Colonel Hoszbach) was held at the Reich Chancellery in Berlin.

Hitler told this conference, which included defendants Goering, Raeder, and von Neurath, that Germany must have living space, that this space could be acquired only by force, and that he would seize Austria and Czechoslovakia as soon as possible. Austria was, in fact, seized six months later, in March 1938. On May 30, 1938, a military directive by Hitler declared his "unalterable decision to smash Czechoslovakia by military action in the near future." The attack on Czechoslovakia was planned in detail long before the Munich Conference and troops were ready to march, according to the German military plan captured and put in evidence, but the Munich pact was signed on September 29, 1938. Less than a month later, Hitler had already signed a military directive to seize the rest of Czechoslovakia; on March 14, 1939, the Czech President submitted to Hitler's threats and surrendered Bohemia and Moravia.

The second secret meeting on which the Tribunal relied because of the captured notes submitted in evidence took place on May 23, 1939, when Hitler announced his decision to attack Poland, though he realized this probably meant war with England and France. It was at this meeting that he said,

"There is, therefore, no question of sparing Poland, and we are left with the decision to attack Poland at the first suitable opportunity. We cannot expect a repetition of the Czech affair. There will be war."

War preparations began immediately. The third meeting regarded as important by the opinion took place August 22, 1939, when Hitler spoke to his commanders in chief and the field generals. One set of notes on this meeting contained his statement:

"I shall give a propagandist cause for starting the war—never mind whether it be plausible or not. The victor shall not be asked later on whether we told the truth or not. In starting and making a war, not the Right is what matters, but Victory."

For the next week Hitler tried to prevent Great Britain and France from aiding Poland; finally convinced he could not, he ordered war nonetheless on September 1. The Tribunal's opinion stated:

"The Tribunal is fully satisfied by the evidence that the war initiated by Germany against Poland on September 1, 1939, was most plainly an aggressive war, which was to develop in due course into a war which embraced almost the whole world, and resulted in the commission of countless crimes, both against the laws and customs of war, and against humanity."

On November 23, 1939, Hitler held his fourth secret conference. With Poland crushed and with Austria and Czechoslovakia already incorporated into the Reich, and the war against Great Britain and France temporarily static, Hitler reviewed the past with his military commanders. He told them that every step so far taken had been according to

plan; he said his intentions were aggressive from the beginning:

"Basically I did not organize the armed forces in order not to strike. The decision to strike was always in me. Earlier or later I wanted to solve the problem. Under pressure it was decided that the East was to be attacked first."

On April 9, 1940, Norway and Denmark were invaded by Germany. The Tribunal held that the conception of attacking these countries originated with defendants Raeder and Rosenberg, and that, according to the evidence, they finally convinced Hitler, originally opposed to this extension of the war. Although the defense had introduced evidence that England planned to invade Norway and therefore that Germany was compelled to attack in order to forestall this Allied invasion, the Judgment did not accept this view. It held:

"In the light of all the available evidence it is impossible to accept the contention that the invasions of Denmark and Norway were defensive, and in the opinion of the Tribunal they were acts of aggressive war."

The Tribunal also held that the invasions of Belgium, the Netherlands, and Luxemborg on May 10, 1940, were entirely without justification and were planned acts of aggressive war. This conclusion was in part based on Hitler's statement in May, 1939, to his military commanders that "Dutch and Belgian air bases must be occupied. . . declarations of neutrality must be ignored."

On April 6, 1941, German forces invaded Greece and Yugoslavia without warning. After reviewing the evidence of long military planning against these two countries the opinion said:

"It is clear from this narrative that aggressive war against Greece and Yugoslavia had long been in contemplation, certainly as early as August of 1939."

The Tribunal also found that the war against the Soviet Union was an aggressive war. Despite its non-aggression pact with the Union of Soviet Socialist Republics of August 23, 1939, Germany had begun to plan for war in the late summer of 1940, according to prosecution evidence. It attacked on June 22, 1941. "It was plain aggression."

As to the war against the United States, the opinion read:

"When Japan attacked the United States fleet in Pearl Harbor and thus made aggressive war against the United States, the Nazi Government caused Germany to enter that war at once on the side of Japan by declaring war themselves on the United States."

On its review of the evidence and findings of fact, the Judgment of Nuremberg held that the German government had committed crimes against peace by planning, preparing, initiating, and engaging in wars of aggression against ten nations, and committed acts of aggression against two others, Austria and Czechoslovakia. (The latter were not charged in the indictment as "wars.")

**The Law.** Although the Tribunal declared it was bound by the law stated in the Charter, since the making of the Charter was a lawful exercise of their sovereign legislative power by those nations to which Germany surrendered unconditionally, it nevertheless expressed its view on the questions of international law which had been argued by the prosecution and defense.

The opinion rejected the *ex post facto* argument by the defense, that there can be no punishment of crime without a pre-existing law. It did so on several grounds. The *ex post facto* rule is not a limitation of sovereignty, it pointed out, but a principle of justice; and to assert it is unjust to punish those who in disregard of their own treaties have attacked neighboring countries without warning is

completely untrue, since the attacker must know he is doing wrong. The Tribunal said further that the Pact of Paris (The General Treaty for the Renunciation of War, of August 27, 1928), which was binding on Germany, Italy, and Japan, had expressly renounced war as an instrument of policy, and therefore, that such a war is illegal in international law. Those who plan and wage such an illegal war thus commit a crime.

To the defense contention that the Pact of Paris did not expressly say that wars are criminal, nor did it set up courts to try war makers, the Tribunal replied that this had also been true with regard to the laws of war codified in the Hague Convention of 1907; and that for many years competent military tribunals had, without objections being raised, tried and punished individuals guilty of violating those rules of land warfare.

The Tribunal then rejected as bad law the twin contentions that international law deals only with states and can not punish individuals and that such individuals are protected by the doctrine of the sovereignty of the state. "Crimes against international law are committed by men, not by abstract entities." It further rejected the doctrine of superior orders as an excuse and pointed out that such a doctrine has never been accepted by international law or the law of any nation. "The true test, which is found in varying degrees of the criminal laws of most nations, is not the existence of the order, but whether moral choice was in fact possible."

In their discussion of the law on the common plan or conspiracy, however, the judges severely limited the prosecution contention that any significant participation in the affairs of the Nazi party or government from the beginning of its rise to power in 1920 was valid evidence of participation in a criminal conspiracy. The Tribunal said: "That plans were made to wage wars, as early as November 5th, 1937, and probably before that, is apparent," but in effect it refused to go back any further than 1937. It insisted in the Judgment that the conspiracy would have to be clearly outlined as to its criminal purpose; nor could the conspiracy be too far removed from the time of decision and of action if it was to be regarded as criminal. The acquittal of certain defendants on Count One—the conspiracy count—makes it clear also that the conspirators must either have participated in the planning of the wars first-hand or have had knowledge of such planning and acted thereon.

**War Crimes and Crimes Against Humanity.** Count Three of the indictment submitted by the prosecution dealt with war crimes. Count Four was concerned with crimes against humanity. Article 6 (b) and (c) of the Charter read as follows:

"(b) War Crimes. Namely, violations of the laws or customs of war. Such violations shall include, but not be limited to, murder, ill-treatment or deportation to slave labor or for any other purpose of civilian population of or in occupied territory, murder or ill-treatment of prisoners of war or persons on the seas, killing of hostages, plunder of public or private property, wanton destruction of cities, towns, or villages, or devastation not justified by military necessity;

(c) Crimes against humanity. Namely, murder, extermination, enslavement, deportation, and other inhumane acts committed against any civilian population, before or during the war, or persecutions on political, racial, or religious grounds in execution of or in connection with any crime within the jurisdiction of the Tribunal, whether or not in violation of the domestic law of the country where perpetrated."

The evidence sustaining Counts Three and Four as to war crimes and crimes against humanity was introduced at the same time and since the Charter provided that the Tribunal had jurisdiction as to crimes against humanity when these were com-

mitted "in execution of or in connection with any crime in the jurisdiction of the Tribunal," and since the jurisdiction of the Tribunal consisted of crimes against peace (aggressive war) and war crimes, the Tribunal lumped both counts together in its opinion both as a matter of law and also as a matter of convenience.

Many weeks were devoted to evidence relating to such crimes and the opinion states that it is impossible to review this evidence adequately. "The truth remains," it said, "that war crimes were committed on a vast scale never before seen in the history of War":

"They were perpetrated in all the countries occupied by Germany, and on the high seas, and were attended by every conceivable circumstance of cruelty and horror. There can be no doubt that the majority of them arose from the Nazi conception of 'total war,' with which the aggressive wars were waged. They were for the most part the result of cold and criminal calculation."

**Murder and Ill-Treatment of Prisoners of War.** The Tribunal found that many Allied soldiers who surrendered were executed, often as a matter of deliberate and high official policy. The "Commando Order" of October 18, 1942, was authorized by Hitler and signed by Field Marshal Keitel, the Chief of the German General Staff. The German Army issued the "Bullet Decree" of March, 1944, which provided for the execution of all escaped officers. Allied airmen were killed by the civilian population at the direct instigation of the Nazi leaders.

Treatment of Soviet prisoners of war was particularly inhumane. The German Army directed that Soviet soldiers were not protected by the Geneva Convention and that all "unbearable" elements among them should be executed. The prosecution showed that Gestapo teams screened all Soviet prisoners of war for the purpose of executing any showing education; in some cases prisoners were ordered branded. They were used in 1943 as subjects for medical experiment in bacteriological warfare.

**Murder and Ill-Treatment of Civilian Population.** The Tribunal found overwhelming evidence of a systematic rule of violence, brutality and terror in the occupied territories. On December 7, 1941, for instance, Hitler issued his "Night and Fog Decree"—all persons suspected of offenses against the German forces were to be deported to German concentration camps without warning or information to their families. In Poland all male relatives of suspected saboteurs were ordered shot, and all female relatives ordered to concentration camps. The Germans continually executed hostages to punish civil disorder. Defendant Keitel ordered fifty to one hundred Russians shot for any German killed: "it should be remembered that a human life in unsettled countries frequently counts for nothing." Entire towns, as was Lidice, were destroyed in several cases. Millions of persons were destroyed in the concentration camps. They were given hard physical labor and inadequate food, clothing and shelter, and subjected to the private whim of the individual guards. Some of the camps were equipped with gas chambers and furnaces: these were used for the extermination of Jews as part of the "final solution" of the Jewish problem.

The murder and ill-treatment of civilians reached its height in the Soviet Union and Poland. Special task forces of the "SD," (called *Einsatz* groups) were sent into Russia. One such group leader testified to the Tribunal that he "liquidated" 90,000 men, women and children. Keitel ordered such tactics to spread terror of the armed forces. But these mass murders and cruelties were not committed

solely to stamp out opposition. They were part of the plan to get rid of certain native populations so their territory could be colonized by the Germans. Defendant Bormann's policy in the east was summarized: "The slaves are to work for us; insofar as we do not need them, they may die." And Himmler said: "What happens to a Russian, a Czech, does not interest me in the slightest." In Poland, the intelligentsia had been marked for extermination as early as 1939.

Property as well as human beings was exploited for the German war effort, according to the Tribunal's findings. There was a systematic "plunder of public or private property." The methods varied from country to country and became more efficient with the passage of time. Raw materials and industries and agricultural products were confiscated without regard to whether the populations would starve; they did so starve in Poland and in the Union of Soviet Socialist Republics. Wholesale seizure was made of art treasures and similar articles in all the invaded countries. The specialized staffs had by July, 1944, shipped 137 freight cars and more than 4,000 cases of articles to Germany.

**Slave Labor Policy.** The law of the Charter making forced labor a war crime is based on the Hague Convention. At least five million persons were deported to Germany to work in industry and agriculture. Defendant Sauckel said, "Out of the five million workers who arrived in Germany, not even 200,000 came voluntarily." Conscription of labor was accompanied by drastic manumits in the streets, in churches, and in private homes. Sauckel's policy was simple "All the men must be fed, sheltered, and treated in such a way as to exploit them to the highest possible extent, at the lowest conceivable degree of expenditure." Allied prisoners of war were employed as a source of slave labor, and, during the latter stages of the war, the inmates of concentration camps were continually used. Prisoners of war were even put to work in munitions factories, loading bombers, digging trenches, carrying ammunition, and manning anti-aircraft, contrary to the Geneva Convention. Once unable to work and so useless to the German war machine, foreign laborers were transferred to special institutions where they were killed.

**Persecution of the Jews.** The defendant Frank testified, "We have fought against Jewry, we have fought against it for years, a thousand years will pass and this guilt of Germany will still not be eased." Although the persecution of the Jews, after the seizure of power was severe in Germany, its severity, the Tribunal found, could not compare with the policy pursued in the occupied territories. In December 1941, Goering, Himmler, and Heydrich reported that 135,000 Jews were killed in three months in the Baltic States alone. The SS Brigadier General who destroyed the Warsaw Ghetto claimed, in his report: "A proved total of 56,065 people. To that we have to add the number of those killed through blasting, fire, etc., which cannot be counted."

The most successful mass method, however, was the gathering of Jews from all German-occupied Europe into concentration camps. Those fit to work were then used as slave laborers. The unfit were destroyed in gas chambers. The commandant of one camp estimated that during his tenure of office three million persons were exterminated. The Tribunal found that the policy of the so-called "final solution" resulted, by the end of the war, in the death of six million Jews. Of these, four million had been killed in extermination institutions.

**Criminal Organizations.** The Committee of Prose-

cutors asked the Tribunal to declare criminal seven organizations.

Because of the large number who were members of these organizations—some estimates ran as high as 6,000,000—the problem of giving all interested persons a hearing presented considerable difficulty. The Tribunal appointed Commissioners to hear defense evidence relating to the organizations. For the defense, 101 witnesses were heard and 1,809 affidavits from other witnesses were put into evidence. Also submitted to the Commissioners in summarized form were 38,000 affidavits signed by 155,000 persons on behalf of the political leaders of the Nazi Party; 136,213 on behalf of the SS; 10,000 on behalf of the SA; 7,000 on behalf of the SD; 3,000 on behalf of the General Staff and High Command, and 2,000 on behalf of the Gestapo. The Tribunal itself heard in public session 22 defense witnesses for the organizations. The reports of its staff and of the Commissioners were introduced into evidence and made part of the official record. The only effect of the declaration of criminality is that the criminal nature of the organization was considered proved.

Of the seven indicted organizations, the Tribunal refused to declare three criminal, and it severely limited its declaration as to the other four. It excluded all persons who ceased to be members of the organizations prior to September 1, 1939, the outbreak of war.

It excluded:

"... persons who had no knowledge of the criminal purposes or acts of the organization and those who were drafted by the State for membership, unless they were personally implicated . . . Membership alone is not enough . . ."

**Leadership Corps of the Nazi Party.** The Leadership Corps was used, the Tribunal held, for criminal purposes such as the persecution of the Jews, administration of the slave labor program and mistreatment of prisoners of war. The finding was limited to members of the Reichsleitung and persons who held positions as *Gauleiter*, *Kreisleiter*, and *Orsgruppenleiter*, and as heads of staff organizations of the Leadership Corps.

**Gestapo and SD.** These organizations were considered together since in the latter stages of the Nazi régime they were, for all practical purposes, organizationally the same. Both were held to be used for criminal purposes involving the persecution and extermination of the Jews, brutalities and killings in concentration camps, administration of the slave labor program and mistreatment and murder of prisoners of war and of civilians in occupied territories.

**The SS.** The Tribunal said "it is impossible to single out any one portion of the SS which was not involved in these criminal activities." The SS had started as an elite corps to protect Hitler personally but had, by the end of the war, reached the size of 40 SS divisions and almost 600,000 troops. The Tribunal found that the SS was utilized for such criminal purposes as the persecution and extermination of the Jews, brutalities, and killings in concentration camps, excesses in the administration of occupied territories, administration of the slave labor program, and mistreatment and murder of prisoners of war.

The other three organizations the Tribunal refused to declare criminal:

**The SA.** This was a formation of the Party organized along military lines but after the Roehm purge it was reduced to a group of unimportant hangers-on. Although some units did commit war crimes and crimes against humanity, the Tribunal held

that its members did not generally participate in or have knowledge of criminal acts.

**The Reich Cabinet.** The Judgment said there was no showing that after 1937 the Cabinet ever acted as a group and, further, the number of persons was so small they could be conveniently tried as individuals. The Russian Judge dissented.

**General Staff and High Command.** The Tribunal, the Soviet Judge dissenting, refused to declare the General Staff and High Command a criminal organization or group for the same reasons that applied to the Reich Cabinet, saying that the 130 military leaders did not function as a "group"; also because their number was so small, they should be tried individually. But the opinion said as to these leaders:

"They have been responsible in large measure for the miseries and suffering that have fallen on millions of men, women and children. They have been a disgrace to the honorable profession of arms. Without their military guidance, the aggressive ambitions of Hitler and his fellow Nazis would have been academic and sterile. . . . The contemporary German militarism flourished briefly with its recent ally, National Socialism, as well as or better than it had in the generations of the past."

**The Individual Defendants.** The Tribunal then made its findings on the individual defendants. Each defendant was indicted on one or more of four Counts: One—The common plan or conspiracy; Two—Crimes against peace (aggressive war); Three—War crimes; Four—Crimes against humanity.

**Goering.** The Commander in Chief of the Luftwaffe, Plenipotentiary of the Four Year Plan and second most prominent man in the Nazi régime, he was indicted and convicted on all four counts. The Tribunal said: "He was the leading war aggressor, both as political and as military leader; he was the director of the slave labor program and the creator of the oppressive program against the Jews and other races, at home and abroad. All of these crimes he has frankly admitted." He was sentenced to death by hanging.

**Hess.** Hess, Deputy to the Fuehrer and his successor designate, was indicted on all four counts but found guilty only on the first two. The Tribunal found he "was an informed and willing participant in German aggression against Austria, Czechoslovakia, and Poland." He was sentenced to life imprisonment. General Nikitchenko, the Soviet judge, dissented, on the ground Hess deserved death.

**Ribbentrop.** The Reichsminister for Foreign Affairs, he was indicted and convicted on all four counts. The Judgment said: "Ribbentrop participated in all of the Nazi aggressions from the oppression of Austria to the invasion of the Soviet Union. . . . In the administration of territories over which Germany acquired control by illegal invasion, Ribbentrop also assisted in carrying out criminal policies. . . ." Death by hanging.

**Keitel.** Chief of the High Command of the Armed Forces, Keitel was found guilty on all four counts. The Tribunal held that, under Hitler, he planned the invasions. He signed the notorious "Commando Order" that Allied commandos be put to death when captured even though in uniform; he ordered that 50 to 100 Communists should be put to death for every attack on a German soldier. He signed the "night and fog" decree. The Tribunal said "Superior orders, even to a soldier cannot be considered in mitigation where crimes as shocking and extensive have been committed consciously, ruthlessly, and without military excuse or justification." Death by hanging.

**Kaltenbrunner.** Indicted on counts 1, 3, and 4, he

was found guilty as to counts 3 and 4. As highest SS and Police leader under Himmler, he was responsible for the activities of the Gestapo and SD in their extermination of approximately 4,000,000 Jews. Death by hanging.

**Rosenberg.** The Party ideologist and *Reichsminister* for the occupied eastern territories, Rosenberg was found guilty on all four counts and sentenced to death by hanging. The Tribunal found he bore a large responsibility for the formulation and execution of occupation policies in the East, and was also in charge of the system of organized plunder of the invaded territories. Although he occasionally objected to the atrocities committed by his subordinates, he did not prevent their mass killings.

**Frank.** He was indicted on counts of 1, 3, and 4 and found guilty on only 3 and 4. As Governor-General of Poland, he was responsible for the dissection of Poland as a national entity and for the reign of terror which resulted in the murder of 3,000,000 Jews. Death by hanging.

**Frick.** He was indicted on all four counts but found not guilty only on Count One. Prussian Minister of the Interior, and Reich Protector of Bohemia and Moravia and an avid Nazi, he was helpful in bringing Germany under the complete control of the Party. He was responsible for the notorious Nuremberg decrees extended to occupied territories and active enforcing of them against the Jews and paving the way for the "final solution," the euphemism for their extermination. Under his jurisdiction were the insane, sick, and aged people who were systematically put to death. Death by hanging.

**Streicher.** One of the earliest members of the Nazi Party, *Gaulciter* of Franconia and publisher of *Der Sturmer*, Streicher was indicted on Counts 1 and 4, and found guilty on Count Four. With knowledge of the extermination of the Jews in occupied territories, he continued to write and publish in his paper the propaganda of death. His incitement to murder and extermination, the Tribunal found, was a crime against humanity and he was sentenced to death by hanging.

**Funk.** Walter Funk was indicted on four counts and found guilty on 2, 3, and 4. The Tribunal said he had participated in the economic planning of aggressive war, particularly against Poland and the Soviet Union. Originally a press chief in the Reich government, he replaced Schacht as Minister of Economics and as president of the Reichsbank. The Tribunal said he was never a leading figure in planning aggressive war and that while he had knowledge of war crimes and crimes against humanity, he did not participate. He was sentenced to life imprisonment.

**Schacht.** Indicted only on counts 1 and 2, Schacht was found not guilty. Although he played a vigorous role in the rearmament program, the opinion stated that the case against Schacht depended on the inference that he knew of Hitler's plans for aggressive war. . . . "On this all-important question, evidence has been given for the prosecution, and a considerable volume of evidence for the defense. The Tribunal has considered the whole of this evidence with great care, and comes to the conclusion that this necessary inference has not been established beyond a reasonable doubt." The Soviet Judge dissented. Schacht, who was Minister of the Reichsbank, was eventually replaced by Funk and after the bomb plot against Hitler, was confined in a concentration camp until the end of the war. The Tribunal also found that he participated in plans to get rid of Hitler.

**Doenitz.** He was indicted on Counts 1, 2, and 3,

was found guilty on counts 2 and 3. Although he did not become Commander in Chief of the German Navy until 1943, the Tribunal found that Admiral Doenitz did wage aggressive war from the beginning, as commander of the U-boat arm. Although found guilty of waging unrestricted submarine warfare, the Tribunal did not sentence him on this charge since the British and American Navies also waged unrestricted submarine warfare. He was sentenced to 10 years imprisonment.

**Raeder.** Admiral Raeder, indicted on Counts 1, 2 and 3, was found guilty on all three. The Tribunal found that the invasion of Norway was his conception; and that he planned and waged aggressive war and was guilty of war crimes, including passing on to his subordinates the "commando order." He was sentenced to life imprisonment.

**Schirach.** Youth leader of the Nazi Party and *Gauleiter* of Vienna, Schirach was tried on Counts 1 and 4 but convicted only on Count Four. He participated in the deportation of Jews from Vienna while aware they would be used as slave labor. He was sentenced to 20 years imprisonment.

**Sauckel.** Although indicted on all four counts, Sauckel, who had over-all responsibility for the slave labor program, was convicted only on counts 3 and 4. He stated that, of the five million persons deported and used as slave labor in Germany, not more than 200,000 were volunteers. Death by hanging.

**Jodl.** Tried on all four counts, Jodl who was the chief of the Operations Staff of the High Command of the Armed Forces, was convicted on all four and sentenced to death by hanging. In the strict military sense he was the planner. He planned the aggressive wars, signed orders which led to war crimes and crimes against humanity, including supplements to the "commando order." The Tribunal said "participation in such crimes as these has never been required of any soldier and he cannot now shield himself behind a mythical requirement of soldierly obedience at all costs as his excuse for commission of these crimes."

**Papen.** Franz von Papen, indicted under counts 1 and 2, was Minister to Vienna and later Ambassador to Turkey. He was found not guilty, the Soviet Judge dissenting. The Tribunal said "Under the Charter, von Papen can be held guilty only if he was a party to the planning of aggressive war. There is no showing that he was a party to the plans under which the occupation of Austria was a step in the direction of further aggressive action, or even that he participated in plans to occupy Austria by aggressive war, if necessary."

**Seyss-Inquart.** Arthur Seyss-Inquart, who became Reich Governor of Austria after Anschluss, then Deputy Governor of Poland and later Reich Commissar for the occupied Netherlands, was tried on all four counts and found guilty on 2, 3, and 4. The Tribunal found he was ruthless in applying terrorism and in sending Jews to concentration camps and that he committed other war crimes. He was sentenced to death by hanging.

**Speer.** Indicted on all four counts, Speer, who was *Reichminister* for Armaments and War Production, the economic czar of Germany, was convicted on counts 3 and 4. He had, said the opinion, no knowledge or participation in initiating wars of aggression but was convicted because of his participation in the slave labor program. Although he had no administrative responsibility for the program, he did put pressure on Sauckel to get him more slave labor for his industries. He was sentenced to 20 years imprisonment.

**Neurath.** He was indicted and convicted on all

four counts. Although he resigned as Foreign Minister in 1938, he had knowledge of the planning for aggressive wars; nevertheless, he retained formal relationship with the Nazi régime. He became Reich Protector for Bohemia and Moravia and, although the oppressive measures carried out there were done by other persons, he did remain until 1941. He was sentenced to 15 years imprisonment.

**Hans Fritzsche.** Indicted on counts 1, 3, and 4, Fritzsche, who was head of the Radio Division at the Propaganda Ministry, was found not guilty on all three counts, on the ground that he did not incite the German people to atrocities and that he had no knowledge of the planning for aggressive war. The Soviet judge dissented.

**Bormann.** Indicted on Counts 1, 3, and 4, Bormann, who replaced Hess as Deputy to the Fuehrer and later became Head of the Party Chancellery and had great influence on Hitler, was tried in absentia because the evidence as to his death was not conclusive. He was found guilty on Count Four and sentenced to death by hanging. He was active in the slave labor program and other war crimes against humanity but since he came to power late in the régime, had no knowledge of the planning for aggression.

**The Significance of Nuremberg.** There appears to be unanimity of opinion that the significance of the Judgment of Nuremberg was the Tribunal's holding that planning, preparing, initiating, or waging aggressive war is an international crime. This is the first judicial formulation of the proposition that aggressive war is criminal and will be so treated.

The final verdict on the Judgment of Nuremberg awaits the historians. Before the trial began and during the course of the proceedings, there was considerable criticism by able and disinterested persons, as well as by those whose motives were not so disinterested. Much of that criticism seems to have abated since the opinion was announced. Informed criticism had not been directed to the trial and conviction of individuals for war crimes and crimes against humanity, since it had long been accepted in international law that these crimes could be punished by properly constituted military tribunals. Nor, rather surprisingly, has there been much note taken of the novel experiment of declaring entire organizations criminal. Criticism was primarily directed at trying and convicting persons for preparing, initiating, and waging aggressive war. It is probable that argument on this point will continue for some years. The former Secretary of State and Secretary of War, Henry Stimson, who has great standing as an international lawyer, recently commented:

"International law is still limited by international politics, and we must not pretend that either can live and grow without the other. But in the judgment of Nuremberg there is affirmed the simple principle of peace—that the man who makes or plans to make aggressive war is a criminal. A standard has been raised to which Americans, at least, must repair; for it is only as this standard is accepted, supported, and enforced, that we can move onward to a world of law and peace" (*Foreign Affairs*, January 1947.)

In his report to President Truman, Judge Francis Biddle said:

"The conclusions of Nuremberg may be ephemeral or may be significant. That depends on whether we now take the next step. It is not enough to set one great precedent that brands as criminal aggressive wars between nations . . .

I suggest, therefore, that immediate consideration be given to drafting such a code (of international criminal law) to be adopted after the most careful study and consideration by the governments of the United Nations."

JAMES ROWE, JR.

**NYASALAND.** A British protectorate in southeastern Africa, grouped with British Central Africa territories. Area, 37,374 square miles. Population (1940 estimate), 1,686,045. Capital, Zomba. The protectorate is administered under the Colonial Office by a governor and commander in chief, assisted by an executive council (nominated) and a legislative council (nominated). Nyasaland has been granted £2,000,000 from the Colonial Development and Welfare Fund.

The country is self-supporting in agriculture except for sugar and wheat. Tobacco is raised extensively and forms a high proportion of total exports. Tea, coffee, cotton, pulses, groundnuts and tung oil are also exported. Imports (£1,682,940) in 1944 were slightly larger than exports (£1,502,154) in the same year.

**OPINION RESEARCH CENTER, National.** An institution established in 1941 by the Field Foundation, Inc., of New York City, in association with the University of Denver, as the first nonprofit, noncommercial organization in the United States devoted to ascertaining public opinion. During 1946 the Center's research was concentrated largely upon securing attitudes in the United States toward (1) the fundamental causes of war, (2) the United Nations, (3) control of the atomic bomb, (4) world trade and tariffs, (5) the responsibilities of government, business, and labor in solving the economic problems of the postwar period, and (6) minority problems in the United States. Detailed reports covering public opinion in these areas are being published by the Center.

A special study undertaken this year reported the public's attitudes toward such civil rights as freedom of speech and freedom of press, as compared to the public's information about the Bill of Rights. Another special report, based on a study of the atomic bomb, its implications to future peace, and the industrial use of atomic energy, analyzed public information and attitudes, and also presented the opinions of experts in the field. NORC's latest report, concerning Japan and the postwar world, covers public opinion on many aspects of this all-important question and also presents selected expert opinion for comparison. Other reports and reprints by NORC staff members and associates concern such subjects as the public's understanding of tariff and trade problems, the development of an NORC cross-section, and analyses of certain ethnic aspects of white attitudes toward Negroes. Attitudes regarding the loyalty of the Japanese and Japanese-Americans have been studied and reported.

Part of the Center's activities are devoted to discovering, testing, and perfecting new techniques, methods, and devices for ascertaining the status of public opinion. In this connection the Center serves as an organization available to research workers in academic fields for the study of such problems as interviewing techniques, analysis of data, and the interpretation of survey results. As part of the program to further develop opinion research as a science, NORC, in July, 1946, sponsored the first national conference of opinion experts.

Another purpose of the Center is to review and analyze the results of surveys made by other polling organizations. The publication, *Opinion News*, fulfills this function. Designed for the use of business men, government officials, educators, librarians, and others who must follow closely the trends of public opinion, *Opinion News* summarizes the findings of all the leading polling and public opinion

surveying organizations, both in the United States and abroad.

The National Opinion Research Center has made surveys, or worked in cooperation with a number of other nonprofit and commercial organizations, including several agencies and departments of the U.S. Government. Acting Director: Gordon Connelly. Office: University of Denver, Denver 10, Colorado. Eastern office: 280 Madison Ave., New York 16, New York.

**PALAU ISLANDS.** A group of islands (143° 10' E. and 6° 50' N.) in the western Carolines of the Japanese Pacific Islands: The chief islands of the group are Palau proper, or Babeldoab (143 sq. mi.), Angaur (3 sq. mi.), and Korror (3 sq. mi.). Total area, 184 square miles. Civil population (1938), 12,798. Angaur supplied 20 percent of Japan's phosphate needs—the total deposits of the island being estimated at 2,400,000 tons. The laterite deposits contain a large amount of bauxite. There are many good anchorages for ships and a large harbor at Malakai. During September, 1944, United States armed forces captured the islands of Palau and Angaur. After the defeat of Japan all the islands passed under United States control. On November 6, 1946, the United States requested that the islands be placed under United Nations trusteeship with the United States as administering authority.

**PALESTINE.** A part of the former Turkish province of Syria, governed by Great Britain as Mandatory Power since Sept. 29, 1923. Area: 10,429 square miles. Capital: Jerusalem.

**The People.** The number of inhabitants in Palestine can only be estimated. There were probably more than 1,800,000 at the end of 1945, divided approximately as follows: Moslems, 1,100,000; Jews, 600,000; Christians, 140,000. During the last twenty-five years the population of Palestine has increased 300 percent due to the large-scale immigration by both Jews and Arabs and to the high birth rate of the latter. The Moslems and most of the Christians are Arabs and speak Arabic as their native tongue. Hebrew is widely used among the Jews, though many of those who migrate to Palestine from Europe have to learn it as an entirely new language. The adaptability of the ancient Hebrew tongue to modern uses has been one of the interesting by-products of Zionist colonization.

There are still many nomads or semi-nomads, chiefly in the south. Due to the tremendous urban development of recent years, nearly half the population now lives in towns or cities. The larger cities, with their estimated populations, are: Tel Aviv, 175,000; Jerusalem, 160,000; Haifa, 130,000; Jaffa, 100,000. Tel Aviv is an all-Jewish city, while half or more of the inhabitants of Haifa and Jerusalem are Jewish.

In 1943-4 the Government operated 422 schools for the Arabs, and 327 non-government ones. Education for Moslem girls is making rapid strides. There were also 161 private Moslem schools. In the Hebrew educational system there were 551 schools, including a number of secondary and technical institutions. Jewish private schools numbered 324. The Christian communities operated 181 schools. On Mount Scopus near Jerusalem is the Hebrew University, which is one of the foremost centers of higher learning in the Middle East.

**The Economy.** Most of Palestine presents a picture of barren hills and treeless steppes. The succession of peoples who have lived in the country since the beginning of historic time have denuded its once

extensive resources of soil and forest. Today this process is gradually being reversed. The influx of Jewish colonists and capital has led to a remarkable agricultural and industrial revival, in which the Arab population has also widely shared. The results of Jewish settlement on the land are especially noticeable on the maritime plain, the Emek (or the valley of Esdraelon) and in the northern Jordan valley. Some 410,000 acres were in Jewish possession in 1943. Further acquisitions were virtually prohibited by the White Paper of 1939.

The volume of the country's agricultural production is shown by the following figures: 13,000,000 cases of oranges and 2,000,000 cases of grapefruit were exported in 1938-9 (exports dropped during the war but are picking up again); milk production in 1943, 120,000,000 litres; average output of olive oil, 7,000 tons. Other crops for 1944 were: wheat, 57,456 tons; barley, 41,482 tons; fresh non-citrus fruit, 201,561 tons; vegetables, 192,887 tons. In 1943 there were 242,945 cattle, 244,062 sheep, 325,376 goats, 29,736 camels and 107,736 donkeys. Many other products could be mentioned by way of illustrating the considerable diversification attained by the country's agricultural and pastoral economy. Reforestation has also been undertaken on a small scale.

The manufacture of many small items has increased greatly, due to the immigration of skilled workmen and artisans from Europe (for statistics see YEAR BOOK for 1944, p. 457). There are extensive oil refineries in Haifa at the western terminus of the pipeline from Iraq. The vast mineral resources of the Dead Sea are exploited by the Palestine Potash Company, which in 1944 produced 105,050 metric tons of potash.

In 1944 imports (principally foodstuffs, textiles and machinery) were valued at £36,223,716 and exports were £14,638,464. Haifa has the only modern harbor in Palestine. At Jaffa and Tel Aviv vessels of any size must anchor out and be serviced by lighters. The railway mileage is 367 kilometers of standard gauge and 144 kilometers of narrow gauge. The completion of the line from Haifa through Beirut to Tripoli during the war put Palestine into direct rail communication with Istanbul. The road system of Palestine has been greatly improved and extended under British administration.

**Government.** Palestine became a Class A Mandate under the League of Nations in 1923. Whether this regime is to be replaced by a United Nations trusteeship is as yet undecided. Palestine is administered by a British High Commissioner, who is assisted by various officials—British, Jewish, and Arab. The country has been divided into six districts, each under a district commissioner.

In governing Palestine the British have found it advisable to give considerable autonomy in certain matters to the Moslem, Jewish, and Christian communities. The religious affairs of the Moslems are controlled by the Moslem Supreme Council, and questions involving their personal status are under the jurisdiction of the Shari'a courts. The Jewish community is organized under an elected assembly and a general council (*Va'ad Leumi*). The community operates its own schools and has courts with jurisdiction over certain matters of personal status. Much the same situation exists for the several Christian communities.

There is also a Jewish Agency, a quasi-governmental body, which concerns itself with the establishment of the Jewish National Home, promised in the Balfour Declaration of Nov. 2, 1917. Finally, there is a regular hierarchy of courts instituted by the Mandatory Power to sit in criminal cases and in

such civil suits as do not come before the religious tribunals. The police force is composed of British, Arab, and Jewish elements. Since the formation of Jewish underground terrorist groups, Britain has also had to use her armed forces to help maintain order. The official languages are English, Arabic, and Hebrew.

**Events, 1946.** The political situation deteriorated steadily throughout the year. It opened with sporadic violence on the part of Jewish terrorists and with countervailing police raids, arms searches and curfews by the mandatory authorities. The Palestine railways were a common target of terrorist action. On January 12 a train was held up between Haifa and Jaffa and a payroll of \$140,000 taken. Five days later, a British police official was killed during a flareup of bombing and shooting. The Zionist resistance forces completely took over Tel Aviv for six hours on February 24 during the funeral of four men killed in an attack on British forces. Two days later, Jewish raiders destroyed 22 R.A.F. planes. Further attacks on British soldiers, resulting in the death of at least seven of them, led to a house-to-house search for terrorists in Tel Aviv on April 26, during which some 1,200 suspected persons were rounded up. Major-General A. J. H. Cassels, commander of the military district containing Tel Aviv, declared the whole Jewish community there responsible for the killing of his men and reimposed a curfew. A number of irresponsible British soldiers, seeking revenge for their comrades' deaths, smashed several Jewish houses in a nearby village.

The cause of Zionist bitterness was the virtual closing of the doors of Palestine to further Jewish immigration. On January 2 the Chief Secretary of the mandatory regime confirmed the report that all visas allowed under the 1939 *White Paper* had been issued, though some four or five thousand immigrants bearing them were yet to arrive. This, of course, came at a time when scores of thousands of Jews were clamoring for escape from Central Europe and for whom Palestine offered about the only available haven. According to General Frederick Morgan of UNRRA, there was in Central Europe a well-organized movement to get Jewish displaced persons started on the road to Palestine despite the absence of legal permits for entrance there. His charges were vehemently denied, but the fact remained that Jewish refugees continued to congregate in certain Mediterranean ports, especially in Italy, to embark for Haifa, sometimes in decrepit and unsanitary vessels. British officials estimated in November that there were 100 craft engaged in this traffic.

One of the principal questions to be investigated by the joint Anglo-American Committee of Inquiry, appointed late in 1945 (see YEAR BOOK for 1945, p. 438) was that of further Jewish immigration into Palestine. In order to preserve the status quo during the committee's sittings, the High Commissioner, General Sir Alan Cunningham, announced on January 30 that the government was "provisionally" going to permit the entry of 1,500 Jews a month despite the refusal of the Arab Higher Committee to acquiesce. The latter body had already, on January 9, rejected any concessions and had called for the end of the mandate. Now it protested to the United Nations against the High Commissioner's decision.

At this moment (February 7) one of the Arabs' most trusted leaders, Jamal el Hussein, cousin of the Grand Mufti, returned from several years' involuntary exile in Southern Rhodesia. On the 11th he declared that Arabs would appear before the

Anglo-American Committee only if all their leaders were liberated and returned to Palestine.

The Committee convened at the State Department in Washington on January 4 and began taking testimony from witnesses. Hearings were suspended on the 14th and reopened in London on the 25th. On March 2 the Committee was in Cairo, later transferring to Palestine and sending subcommittees to various parts of the Middle East. The hearings ended on March 26 after the Zionists and the Arabs had once again reiterated their well-known conflicting and uncompromising positions. On one point they were agreed: that if British troops were withdrawn from Palestine, they could take care of themselves.

The Committee's report was released on April 30. It contained ten major recommendations, including the immediate admission of 100,000 Jewish victims of Fascist and Nazi persecution. As for the political future of Palestine, the Committee stated that:

"In order to dispose, once and for all, of the exclusive claims of Jews and Arabs to Palestine, we regard it as essential that a clear statement of the following principles should be made (1) that Jew shall not dominate Arab and Arab shall not dominate Jew in Palestine; (2) that Palestine shall be neither a Jewish State nor an Arab State, (3) that the form of government ultimately to be established shall, under international guarantees, fully protect and preserve the interests in the Holy Land of Christendom and of the Moslem and Jewish faiths. Thus Palestine must ultimately become a State which guards the rights and interests of Moslems, Jews and Christians alike, and accords to the inhabitants, as a whole, the fullest measure of self-government, consistent with the three paramount principles set forth above

"We have reached the conclusion that the hostility between Jews and Arabs and, in particular, the determination of each to achieve domination, if necessary by violence, make it almost certain that, now and for some time to come, any attempt to establish either an independent Palestinian State or independent Palestinian States would result in civil strife such as might threaten the peace of the world. We therefore recommend that, until this hostility disappears, the government of Palestine be continued as at present under mandate pending the execution of a trusteeship agreement under the United Nations . . .

"We recommend that the mandatory or trustee should proclaim the principle that Arab economic, educational and political advancement in Palestine is of equal importance with that of the Jews, and should at once prepare measures designed to bridge the gap which now exists and raise the Arab standard of living to that of the Jews; and so bring the two peoples to a full appreciation of their common interest and common destiny in the land where both belong "

Other recommendations favored removal of restrictions on land transfers, the economic development of both the Jewish and Arab communities, the reform of education, and the suppression of terrorism and violence.

President Truman expressed satisfaction with the report, particularly with the recommendation that 100,000 Jews be admitted to Palestine forthwith. The Zionists were likewise pleased at this recommendation, but were far from happy at being denied a Jewish state.

It was the Arabs who took the most positive stand against the report. On May 2 the Arab Higher Committee sent a letter to the British Cabinet threatening to resume the "national struggle" if the recommendations were effected. The following day saw a strike of the Arabs in Palestine, Syria and the Lebanon. On the 8th Jamal declared that the Arab Higher Committee had cabled Stalin for his aid in preventing the report from being implemented. On the 10th Under-Secretary of State Dean Acheson informed the representatives of five Arab states that the United States would adhere to the late President Roosevelt's pledge to consult both Arabs and Jews in regard to Palestine. On May 15 the Arab Higher Committee asked for the

dissolution of the Jewish Agency and on the 24th it demanded the end of Jewish immigration, the withdrawal of foreign troops and the formation of an "independent Arab state of Palestine."

The official British response to the publication of the report was somewhat mixed. Prime Minister Attlee, addressing the Commons on May 1, made it clear that Britain would not carry out the recommendations singlehanded. Other British sources pointedly asked whether the United States would open its own doors to Jewish refugees or would send troops to Palestine to aid in disarming the Jewish underground forces, said to number 60,000. Britain already had 100,000 troops in the Holy Land and was fearful that any increase would drive the Arabs into the arms of Russia. In mid-May the American and British governments began consulting the Arab states, as well as both Arab and Jewish unofficial groups, to see what measures could be taken to follow up the report. On June 11 President Truman created a special Cabinet committee to help him formulate a Palestine policy. It consisted of Secretaries Byrnes (State), Snyder (Treasury) and Patterson (War). A day later, Foreign Secretary Bevin, addressing the annual Labour Party Conference at Bournemouth, said that if he were to let 100,000 Jews enter Palestine he would have to put another division of troops there, "and I am not prepared to do that." He also made a few caustic remarks about the unwillingness of the United States to take any of the Jewish refugees over whom it expressed such concern.

Meanwhile the British authorities in Palestine exacerbated Arab opinion, without placating the Zionists, by lifting the monthly quota of immigration certificates for Jews from 1,500 to 2,000. This small increase was wholly inadequate to provide certification for the shiploads of illegal immigrants that were put in detention camps as fast as they arrived. This unauthorized influx of Jews naturally angered the Arab leaders. There seems, however, to have been some difference of opinion as to how best to meet the danger. The Husseini Party, which early in May won five out of the eight seats in the Jerusalem Municipal Council, was for strong action. Apparently the five other Arab parties wanted a less strenuous policy, since they were reported on May 29 to be abandoning the Higher Committee to form a Higher Front which would submit the case to the United Nations.

At this juncture the Arab League held a Council meeting at Bludan in Syria, and Haj Amin el Husseini, the Grand Mufti of Jerusalem, escaped from France and made his way to Egypt (see PAN ARAB AFFAIRS).

A new series of terrorist outbreaks was marked by the blowing up of five bridges across the Jordan River on June 16. The British authorities at once organized a vast man-hunt for the perpetrators. On the following day fires and explosions wrecked bridges, railway lines, shops, and many other structures, by way of demonstrating to Mr. Bevin that it would take more than another division to keep the Jewish refugees out of Palestine. On the 18th two British officers were shot in Jerusalem and five were kidnapped at Tel Aviv. Two of the latter were soon released, but the other three were kept as hostages by the Irgun Zvai Leumi until July 4—during the trial of thirty-one of their members accused of carrying firearms illegally; thirty were given sentences of fifteen years and the other one, of life. By June 29 the British campaign to locate the leadership of the Haganah led them to seize the Jewish Agency building and its contents (including files) in Jerusalem and to arrest a number

of its leaders, such as Moshe Shertok. Altogether about a thousand Jews were detained.

These measures evoked a call on July 1 from some 250 Jewish leaders for a passive war on British authority in Palestine. Meanwhile, the search for arms caches in Jewish centers and settlements had turned up a large supply, which however probably represented only a small part of the munitions and weapons hidden by the Jewish resistance movement. On the same day Prime Minister Attlee made a lengthy statement on Palestine in the House of Commons, in which he asserted that the government had evidence of a connection between the Jewish Agency and the terrorists, and between the Irgun Zvai Leumi and the Haganah. The Agency denied this, but on July 24 the government published a *White Paper* purportedly proving the existence of these links.

On July 17 the Jewish population of Palestine, with notable solidarity, staged a one-day sympathy strike for the men held in the detention camps. Five days later, the Irgun blew up a wing of the King David Hotel in Jerusalem, killing 91, wounding 45 and leaving 29 missing. About half of the government staff, which was using the hotel as its headquarters, was wiped out. This naturally led to new searches for arms and round-ups of suspected terrorists.

By July 25 it was reported in London that the Anglo-American joint Cabinet Committee was proposing the partition and federalization of Palestine. According to this plan the Zionists would gain autonomy in a narrow belt of land running along the coast as far north as Haifa, then cutting inland to include the Valley of Esdraelon and finally turning north again along the upper Jordan valley to include the Galilee and Huleh Lake areas. The Arab districts would comprise the rest of the country, minus Jerusalem, Bethlehem and the and Negev triangle in the south. Jaffa would constitute an Arab enclave in the Jewish zone, in order that the Arabs might have a port of their own. The long, crooked, narrow Jewish-controlled strip would contain about 1,500 square miles, compared with the 2,600 square miles suggested in the partition plan broached by the Peel Commission before World War II. This 1946 plan did not propose the creation of Jewish and Arab states, for the central executive power of the British was to be strong, thus leaving relatively little autonomy to the federal units.

At the same time the British government revealed plans for a conference to be attended in London by Arab and Jewish leaders. The latter said they would not come if Arab consent were made a condition for permitting the 100,000 refugees to enter Palestine. The Palestine Arabs, presumably on the orders of the Grand Mufti, then residing in Alexandria, rejected the invitation on August 8. They later sought to get the Mufti accepted by the British as a delegate, and again (August 31) refused to attend when London turned down this request.

When the partition plan became known in the United States, it was widely criticized and Mr. Byrnes said that it was a British, not an American, proposal. A statement issued by the White House on July 2 had already indicated that the United States was prepared to shoulder the technical and financial responsibility for transporting the 100,000 Jews from Europe to Palestine. On July 31, Herbert Morrison told the Commons that Britain would accept the Joint Committee's recommendations as a basis for negotiation only if it were sure of American cooperation in putting them into effect. A two-

day debate ensued during which the Tories decried further delay in settling the problem.

The Conference was opened in London on September 10 by Mr. Attlee, who asserted that Britain would not insist on federation but hoped for some form of Arab-Jewish compromise. Since neither the Palestine Arabs nor the Zionists would attend, the conferees consisted of British officials and representatives of the seven Arab states. From the start the latter refused to consider partition—as did the Zionists, for that matter—and reiterated their old demand for a democratic Arab state, in which they offered the Jews the permanent status and guaranteed rights of a minority on condition that Zionist immigration be stopped once and for all. The deadlock was soon apparent, and on October 2 the Conference was adjourned to December 16. In a message to Mr. Attlee on October 4, President Truman expressed regret at the failure of the Conference to provide for the admission of the 100,000 Jews. In the end the conference was postponed once again, this time until 1947.

The continued arrival of unauthorized Jewish immigrants finally obliged the Palestine authorities after August 12 to prevent their landing by force and to ship them to detention camps in Cyprus. In enforcing this rule persons were not infrequently killed or hurt. The Irgun answered this "blockade" on August 14 by calling on the Haganah and Sternists to form a Jewish Army and take over the rule of Palestine. Another source of exasperation was added on the 16th when eighteen Zionists were sentenced to death for participating in the destruction of the Haifa railway shops, though these sentences were commuted on August 29. A revival of terrorist activities resulted in the reimposition of the curfew, but this did not stop the attacks and the killings.

By now the Arabs, to whom a firmer policy had been imparted by the Mufti's arrival in Egypt, were thoroughly angry over Jewish terrorism and redoubled their efforts to organize and equip military forces of their own. Early in the fall a "shadow" Arab government was set up in Palestine under Jamal el Hussein and directed from Egypt by the Mufti. In order not to have to depend any longer on financial help from the Arab states, it was planned to impose taxes on the Arabs in Palestine to support this extra-constitutional regime. The Arabs marked November 2 with a one-day strike against the Balfour Declaration.

A new wave of Jewish violence—sporadic but apparently well organized and often leading to fatalities—got under way in mid-October. In addition to the usual sabotage of railways, mining of roads, bombing of buildings, assassination of officials and the like, the long-dormant conflict with the Arabs over the land was renewed. Eight "detained" leaders of the Jewish Agency were finally freed on November 5, but the acts of violence continued. Between July and October 31 Britishers were killed, and the tempo of killing speeded up during November. There was a moratorium on violence during the time the World Zionist Congress was in session at Basel—December 9 to 24—but it was resumed thereafter. On December 29 the Irgun kidnapped and flogged a British major and three sergeants.

The Basel Congress met under none too happy auspices. Dr. Chaim Weizmann, elected presiding officer of the sessions, restated the case for a Jewish state but deplored terrorism. The arguments over partition and the policy of cooperating with Britain were long and bitter, and so split the Congress that it was unable to elect a new president of

the Zionist Executive to replace Weizmann. An increased budget for the Jewish Agency was adopted—\$50,000,000 for the coming year. Figures were also released showing that, despite the restrictive regulations of 1940, some 100,000 acres had been purchased by Zionist enterprises in Palestine since 1939, for which purpose \$42,000,000 had been raised.

Despite the unsettled condition of public security, the economic life of the country managed to rock along. Trade with the United States rose in value, much of it represented by the diamond trade. In September the Palestine Citrus Marketing Board arranged for the sale to Great Britain of 6,500,000 boxes of fruit from the current season's harvest. Added to the amounts destined for Ireland and the Continent, some 10,000,000 boxes were expected to be sold, giving the industry a profit for the first time since the war began. However, several good seasons were needed in order that the growers might pay back the £4,000,000 which had been advanced to them by the government when export markets had been curtailed by the war.

On the Arab side, plans were formulated for creating a land bank, capitalized at a million pounds, to assist Arab landowners in resisting the lure of high prices offered by the Zionists.

Early in January the Palestine government granted a concession to the American-owned Trans-Arabian Pipeline Co. to construct a pipeline across the country en route from the oil fields of Saudi Arabia to the Mediterranean Sea.

ROBERT GALE WOOLBERT.

**PALMYRA ISLAND.** An atoll in the Central Pacific, belonging to the United States. Lying 1,109 air miles southwest of Honolulu and 1,513 miles northeast of Pago Pago in American Samoa, it is an important station on the Hawaii-Samoa air route. Land area, 1½ square miles. Population (1940 census), 32. The United States Navy Department which has jurisdiction over the island, converted it into a naval air station.

**PANAMA.** A republic of Central America. Area: 28,575 square miles, excluding the Canal Zone of 553 square miles. Population: 631,637 (1940). Capital: Panamá.

Most of the surface of Panama is covered by low mountains and hills; a gap between the mountain ranges provides the lowland through which the Canal passes. The climate is mostly hot and humid, but on the Pacific side of the mountains it is drier and more healthful. The mean annual temperature is 80 degrees.

**The People.** Fifty-eight percent of the total population of Panama is mestizo, 17 percent of European descent, 15 percent Negro, and 9 percent Indian. The largest concentration of population is in the vicinity of the Canal Zone and in the north-central region. The largest cities are: Panamá, 111,893; Colón, 44,393; and David, 9,222. The small foreign population forms the dominant economic group.

Spanish is the official language. Roman Catholicism is the predominant religion.

According to the census of 1940, 64.7 percent of the population over 10 years of age (excluding Indians) is literate. In 1942 there were 74,039 students enrolled in 670 elementary schools; 8,407 students in 29 intermediate schools; and 857 in the University of Panama. During 1945 the Panamanian Government provided funds for 86 new schools.

**National Economy.** The economic life of the coun-

try is influenced to a large extent by the Panama Canal. Major economic activities are associated with the passage of goods through the Canal, and in recent years construction activities in the Canal Zone and provision of commercial services for military and civilian personnel have played an important part in the economy of the rest of Panama. Agriculture is the chief occupation. Bananas are the principal export crop, and cocoa and abacá are also raised for export. Rice, corn, coffee, sugar, tobacco, beans and fruits are grown for local use. Cattle raising, rubber production, and exploitation of forest products are also important.

Industrial development has been limited by the small size of the local market. Sugar and rice are processed, and shoes, soap, beverages, hats, furniture, and clothing are manufactured.

**Foreign Trade.** Exports during 1945 were valued at \$4,507,137, compared with \$2,809,982 in 1944; this reflected increased shipments of bananas and abacá. Total exports of bananas in 1945 amounted to \$2,000,000; of abacá, \$1,121,000. Rubber exports to the United States in 1945 totaled about 750,000 pounds.

Panama's imports for 1945 were valued at \$45,648,125, of which 66 percent originated in the United States. Manufactured goods and foodstuffs were the chief imports.

**Government.** Panama is a centralized republic of 7 provinces and 1 intendencia. The Constitution of 1940 provided for a unicameral National Assembly of 32 members, to meet annually for four months, beginning on Jan. 2. The President and members of the Assembly were elected directly and concurrently for 6-year terms. The president was aided by a Cabinet of 6 members. President Ricardo Adolfo de la Guardia dissolved the Assembly in December, 1944, and called elections for a Constituent Assembly, which convened in June, 1945, and selected Enrique A. Jiménez Provisional President.

**Events, 1946.** Provisional President Enrique A. Jiménez's term of office was extended to September 30, 1948 early in the year by the Constituent Assembly, which changed itself into a Legislative Assembly on February 28. The Legislative Assembly also voted in a new Constitution which prohibited United States nationals from opening retail business in Panama and permitted other foreigners to open businesses only if 80 percent permanent employment was given to Panamanians and residence was established in Panama instead of in the Canal Zone.

A three-months session of the Assembly was opened on May 15 by President Jiménez who reported that under his administration since June 15, 1945, an extensive public works program had been inaugurated and good relations had been carried on with the United States with regard to wartime military bases in Panama. A considerable portion of his report was devoted to the activities and supporters of Dr. Arnulfo Arias, deposed President (1940-1941) of Panama. After an attack on the Colón police station on December 21, 1945 in which five people were killed and several wounded, Dr. Arias and many of his followers were imprisoned. The President charged the followers of Dr. Arias with "unjustified agitation of the masses."

The issues surrounding the status of United States wartime military bases provided Panama with an important international problem. Under the terms of the original agreement, the United States was authorized to occupy 83 Panamanian bases until September 1. Sixty of the bases had been returned prior to the termination date. Al-

though the United States reportedly requested a conference to discuss a new defense agreement with Panama, President Jiménez on September 3 said that no agreement for the occupation of defense sites by the United States would be negotiated until the sites occupied were returned.

On September 12 both nations issued a joint statement declaring that the question of bases would be worked out through friendly negotiations. United States reluctance to withdraw from several of the bases hinged on the desire to provide adequate defenses for the Panama Canal. The joint statement said that both Governments had agreed to consult "on the most effective means for assuring the defense of the Panama Canal" with respect to the basic treaty of 1936 and Defense Sites Agreement of 1942. During December a solution to the problem of bases appeared imminent with the conference between Panama's Minister of Foreign Relations, Ricardo J. Alfaro, and United States Secretary of State, James F. Byrnes, in Washington.

Panama's annual share of \$133,333 to the United Nations Relief and Rehabilitation Administration would not be paid for 1946, President Jiménez said in November, because UNRRA was not willing to accept payment in coffee at a price agreeable to Panama. Panama's budget for the last six months of 1946 contained no allotment of funds for the international organization.

The entire Cabinet, with the exception of Minister of Foreign Relations Alfaro, resigned on December 2 after a clash had arisen between the Minister of Public Works and Education during a meeting to determine the site of a trade school. The resignations were unexpected; originally the Cabinet meeting had been called to discuss the Government economy plan.

Panama's high cost of living prompted the Government during December to consider plans for the establishment of Government stores which would sell such items as rice, cooking oil, sugar, lard, and flour at prices commensurate with the incomes of the working classes. The Retail Businessmen's Association was invited to the conference to determine if the merchants themselves would lower prices on necessities. If reduction in prices could not be effected the Government threatened to open retail stores. In an effort to save \$5,000,000 in the 1947 budget the Government had scheduled for January 1, 1947, reductions in the salaries of all Federal employees.

The status of women in Panama was advanced in late December when the Government announced that women would be included in the jury lists. This marked the first time in Panama's history that women were eligible for jury duty.

**PANAMA CANAL ZONE.** A strip of land crossing the Isthmus of Panama and extending about five miles on each side of the center line of the Canal and three marine miles beyond low water mark in the Atlantic and Pacific oceans. By the Hay-Bunau Varilla Treaty concluded in 1903, the Republic of Panama granted to the United States in perpetuity the use, occupation, and control of the Canal Zone for the construction, maintenance, operation, sanitation, and protection of the Canal. The treaty provided for the payment to Panama of a lump sum on the exchange of ratifications of the treaty, and also an annual payment (which is an annuity and not rental) beginning nine years after the date aforesaid. A new treaty was signed on March 2, 1936, which makes various amendments and additions. Total area of the Canal Zone is 553.12 square

miles, including 190.94 square miles of water. Balboa Heights is the administrative center.

**Population.** The 1940 United States census reported 51,827 persons in the Canal Zone of whom 32,856 were white. According to the annual police census of the Canal Zone taken between March 1 and 31, 1946, the population was 48,352, of which 19,620 were Americans. On June 28, 1946, the force employed by The Panama Canal and the Panama Railroad Company numbered 5,239 on the "gold" roll (chiefly Americans) and 14,899 on the "silver" roll (chiefly natives of the tropics).

**Panama Canal Finances.** For the fiscal year ended June 30, 1946, there was a net revenue from tolls and other sources of \$52,970.49. The net capital investment in the Canal, after depreciation, as of June 30, 1946, was \$660,895,798.50, including \$128,991,063 interest on funds borrowed to construct the Canal up to the formal opening on July 12, 1920.

**Economic Conditions.** The Canal Zone is in effect a U.S. military reservation whose principal industry is the maintenance and operation of the Panama Canal; operation of the auxiliary enterprises necessary to provide adequately for the needs of slugging and of the Canal operating forces; and government of the Canal Zone, populated by American civilians, native or tropical workers and their families, and United States Army and Navy defense forces. Transits in the fiscal year ended June 30, 1946 totaled 9,586, the greatest number of any year in the history of the Canal.

**Government.** A civil government was authorized by Congress by the Panama Canal Act of 1912. Administration rests in the hands of a Governor appointed by the President, by and with the advice and consent of the Senate, for a period of four years, but in wartime it is by Executive Order placed under the authority of the Commanding General of the Panama Canal Department, U.S.A. Subject to such superior authority the scope of government goes much beyond the functions of the government in the other territories. The Governor's duties can be compared to those of an executive in the management of a vast business organization.

**Events, 1946.** During the United Nations discussions of trusteeship territories, Panama voiced objection to the United States report on its non-self-governing territories that included the Canal Zone. Claiming Panamanian sovereignty over the Canal Zone, Dr. R. J. Alfaro, Foreign Minister of Panama, said that the Canal Zone was not "leased" to the United States and the United States annual payment of \$250,000 in gold currency was in lieu of all taxes and not compensation for a lease. The United States recognized Panama's sovereignty over the Canal Zone, but submitted the territory in its report because of the responsibility inherent in its exclusive administration.

The Board of Consultants for the Isthmian Canal Studies which met in Balboa Heights, Canal Zone, during November announced that the original twenty-two routes and plans for the improvement of the Panama Canal had been reduced to eight. Col. James H. Stratton, supervisor of the Panama Canal revaluation project, estimated that by February, 1947, more than half of the remaining eight may have been eliminated by further study.

Outside of Panama, two canal possibilities included the Nicaragua route and the Atrato route, which originates in Columbia. Panamanian possibilities were the San Blas, Caledonia, and Chorrera-Lagarto alignments. The most advantageous choice is the Chorrera route which could be exca-

vated almost entirely "in the dry," a large financial gain over dredging, and would not interfere with the operations of the existing canal.

To permit the largest Navy airplane carriers to pass through the Canal locks, the Navy Department proposed widening the locks to more than 140 feet and building a third set of locks. Between July 1, 1940 and June 30, 1946, about \$75,771,090 of the \$227,000,000 authorized by Congress has been spent on this project.

**PAN AMERICAN ACTIVITIES.** Modifications in the Inter-American System to adjust it to the postwar situation, and coordination of the regional system with the world organization, were among the principal problems confronting the American Republics in their international relations during 1946.

**Reorganization of Inter-American System.** At the Inter-American Conference on Problems of War and Peace held at Mexico City in 1945 provision was made for a comprehensive reorganization of the Inter-American System to adapt it to the changed international situation following the war. Although it was necessary to await the Ninth International Conference of American States which was scheduled to meet at Bogotá, Colombia, for many of the contemplated modifications, some were put into effect at least provisionally during the year.

In accordance with the resolution adopted at Mexico City several governments appointed special ambassadors to represent them on the Governing Board of the Pan American Union. Heretofore, such representation had devolved upon the diplomatic representatives in Washington, and the Secretary of State of the United States. The Mexico City resolution sought to make such special appointments obligatory, but following consultation with the governments it was decided to leave it optional until the Ninth International Conference of American States could give further consideration to the matter. Special ambassadors were appointed by Argentina, Brazil, Colombia, Mexico, Peru, the United States, and Uruguay. Guatemala and Haiti also named special representatives, but both were superseded by the diplomatic representatives of the respective countries in Washington.

The Governing Board also put into effect that provision of the Mexico City resolution prohibiting the re-election of the Chairman for the immediately succeeding term. Although annual elections have been held since 1923, the Secretary of State of the United States had always been elected to the office. For the year 1946 the Ambassador of Brazil, Dr. Carlos Martins, was elected Chairman and following the appointment by Brazil of a special ambassador on the Board, he was succeeded by the Vice Chairman, Dr. Guillermo Sevilla Sacasa, Ambassador of Nicaragua. At elections held on November 6, 1946, the special ambassador of Colombia, Dr. Antonio Rocha, was elected chairman for 1947.

The Inter-American Economic and Social Council, likewise provided for in the resolution adopted at Mexico City, completed its organization and began to function at the Pan American Union during the past year. It is composed of representatives appointed by the 21 governments and is charged with the study of economic and social problems affecting the nations of the Western Hemisphere. The Hon. Spruille Braden, Assistant Secretary of State and Representative of the United States, served as Chairman of the Council during 1946. On November 6, 1946, the Council elected as its Chairman for 1947 the representative of Costa Rica, Dr. J. Rafael Oreamuno.

**Postponement of Conferences.** The application of other features of the contemplated reorganization of the Inter-American System was delayed by the postponement of several important conferences which had been scheduled for the past year.

The Inter-American Conference on the Maintenance of Continental Peace and Security, scheduled to meet at Rio de Janeiro, was twice postponed owing to the unwillingness of the Government of the United States to sign a mutual defense pact with the government of Argentina. The purpose of the meeting is to give permanent form to the principles of mutual assistance contained in the Act of Chapultepec signed at Mexico City in March 1945. The Act is of a provisional nature, intended to operate only during the period of the war emergency. The Rio de Janeiro conference was originally planned for October 1945 and then postponed to April 1946. At the time of the second postponement the Governing Board of the Pan American Union entrusted to the Brazilian Government the selection of the date, but as of the end of the year no announcement of a new date had been made. In anticipation of the meeting eight governments have submitted proposals with reference to the provisions to be incorporated in a continental treaty of mutual assistance.

The Ninth International Conference of American States also was postponed. It had been planned for Bogotá, Colombia in December 1946, but was postponed and is now scheduled for December 1947. The principal items on the agenda of the conference will relate to the reorganization of the Inter-American System.

In preparation for the Bogotá conference several important projects were drawn up during the year. The Governing Board of the Pan American Union drafted a project of Organic Pact of the Inter-American System, a Declaration of the Rights and Duties of American States, and proposals for the establishment of an Inter-American Council of Cultural Cooperation and an Inter-American Council of Jurists. The Inter-American Juridical Committee formulated a coordinated Inter-American Peace System and a draft Declaration of the International Rights and Duties of Man. These were distributed among the governments of the 21 republics, and on the basis of the comments received definitive projects will be prepared and submitted to the Ninth Conference.

The Inter-American Technical Economic Conference, scheduled for the Pan American Union in April 1946, was also postponed. This action was taken partly because of the establishment of the Inter-American Economic and Social Council. In view of the postponement the Council was requested to undertake a study of the topics appearing on the conference agenda.

**Relations with World Organization.** All the American Republics are members of the United Nations and are taking an active part in the work of the world organization and its various agencies.

During the past year the Governing Board of the Pan American Union considered the question of the relations that should exist between inter-American agencies and similar agencies operating on a world level. In the field of international peace and security the charter signed at San Francisco specifically recognizes "the existence of regional arrangements or agencies for dealing with such matters relating to the maintenance of international peace and security as are appropriate for regional action." With respect to regional forms of cooperation in social, economic and related fields the San Francisco conference decided that it would be un-

necessary to include any specific provision of this sort in the Charter.

On this point the Governing Board at the session of November 6, 1946, adopted the following principles intended to govern such relations. (1) The specialized inter-American organizations that function within the Inter-American System shall establish the closest cooperative relations with similar world organizations; (2) on entering into agreements with international organizations of a worldwide character, specialized inter-American organizations shall maintain their identity and position as an integral part of the Inter-American System; (3) the Governing Board of the Pan American Union shall intervene whenever it may deem it necessary in the negotiation of any agreement between the specialized organizations of the Inter-American System and similar organizations of the world system.

L. S. ROWE.

**PAN ARAB AFFAIRS.** The year saw a strengthening of the political influence of the Arab League and, through it, a tightening of the bonds of Arab solidarity. Unquestionably the predominant factor in impelling the Arab countries toward closer cooperation was the danger of a Jewish state in Palestine. It is not inaccurate or unfair to say that without political Zionism, the Arab League would not have become an effective instrument.

A boycott of Jewish business and products was supposed to get under way in all the Arab League countries at the first of the year, but was not effective everywhere or at once. The governments of several of them adopted measures to halt the flow of Jewish-made goods into their territories. Syria declared it treason to smuggle Palestine goods into the country.

At the opening of the new permanent headquarters of the Arab League in the Monastirli Palace at Cairo, the Egyptian Prime Minister, Nokrashy Pasha, read a joint statement on behalf of King Farouk and King Ibn Saud, then on a visit in Egypt (see ARABIA), asserting that Palestine must remain an Arab country.

The third regular meeting of the Council of the Arab League opened in Cairo on March 25. Most of the matters that came before it were of a technical nature. Among other things it approved the creation of an Arab bank in Palestine, to be capitalized initially at one million pounds, which would provide funds for keeping Arab-owned lands from being sold to Jewish colonists or Zionist organizations (see PALESTINE). At the final sitting of the Council, on April 13, it approved a definition of common Arab citizenship for submission to the member states. If adopted it would mean in effect that the inhabitants of these seven countries would have a double loyalty, which in time might prepare the way for an over-all Arab nationalism. Such a common citizenship would also facilitate freedom of movement among the member states and provide a common equality under the law for the nationals of one in the territory of all the others. At the same time the Council decided not to discuss the delicate question, raised by the Lebanon, as to whether Trans-Jordan's new treaty with Great Britain gave the former real independence (see TRANS-JORDAN).

The recommendations of the Joint Anglo-American Committee on the Jewish problem and its reflex in Palestine, published at the end of April (see PALESTINE), of course enraged Arabs throughout the Middle East and brought on a rash of protests, strikes, and even threats to abrogate existing treaties

with Britain. In this crisis, two extraordinary meetings were called among the Arabs. The first, convening near Cairo on May 28, comprised the rulers of the seven Arab states or members of their families. Present were two kings (Egypt and Trans-Jordan), one Regent (Iraq), two royal princes (Saudi Arabia and the Yemen), and two presidents (Syria and the Lebanon). Though brought together by the urgency of the Palestine Problem, the conference also had on its agenda these other points: reconciliation of the Hashimite and Saudi families, the revision of the Anglo-Egyptian Treaty, the attitude of the Great Powers toward the Arab states, and the representation of the latter at the coming peace conference in Paris. After a two-day session, it was announced on the 30th that the conference, in a remarkable display of unity, had unanimously agreed: to oppose the reopening of Palestine to Jewish immigration; to favor the independence of Libya and of all Arab countries, and to recommend the completion of Egyptian independence.

The second conference called under the impact of the Anglo-American Committee report was that of the Arab League, meeting in extraordinary session at Bludan in Syria on June 8, simultaneously with an announcement by the French Foreign Ministry that the Grand Mufti, supposedly being detained in France, had left the country. Naturally observers saw more than a coincidence in the timing of the Mufti's departure, and the British Foreign Office gave signs of extreme annoyance. For a number of days the Mufti's whereabouts was shrouded in mystery. Several apparently circumstantial reports placed him in Syria, where he was said to be guiding the discussions at Bludan. Only after several days did it become known that he had flown to Egypt and was living there more or less as a guest of the Egyptian government. On July 5 he was reported to have taken a villa in Alexandria. Though supposedly forbidden by the Egyptian authorities to engage in political activities, it was soon evident that the Mufti was up to his ears in intrigue and was in effect directing the Arab Higher Committee of Palestine by remote control.

At Bludan the delegates voted unanimously on June 12 to push for the creation of a United Nations trusteeship in Palestine to replace the League of Nations mandate. They also ordered the Arab Higher Committee and the Higher Front in Palestine (see PALESTINE) to dissolve and be replaced with an over-all executive committee, with the Mufti as its spiritual head. Following the conference, the Arab League sent notes to the British and American governments in regard to the Palestine situation. The note to Washington challenged the legal right of the United States to intervene in the Holy Land and warned that if the Zionists continued to arm, the Arabs "would not stand by with their arms folded."

On behalf of the other Arab states, the Egyptian Foreign Minister on June 20 addressed a note to the British government inviting the latter to negotiate with the League members "an arrangement destined to end the present situation in Palestine and to install a new regime in accordance with the provisions and the aims expressed in the Charter of the United Nations." A copy of this note was sent to the United Nations Secretariat on June 25, and was published on July 23.

The London Conference, called by the British government in the hope of getting the Palestine Problem threshed out around the table, was attended by delegates of the Arab states on the spe-

cific understanding that they came with completely free hands. The conference met on September 10, but without representatives of the Palestine Arabs or Zionists. A deadlock soon became apparent and on October 2 the conference was adjourned until December 16, and later until 1947 (see PALESTINE). Meanwhile the Arabs were becoming growingly exasperated with Jewish terrorism in Palestine and with what they regarded as Britain's ineffectual attempts to cope with it. They also resented repeated statements by President Truman in favor of opening Palestine to 100,000 Jewish refugees from Europe.

A regular meeting—the fourth—of the Council of the Arab League began at Cairo on November 18. The Mufti was not invited to attend, the Palestine Arabs being represented by Jamal el Huseini. The Palestine question, as usual, was uppermost in the delegates' minds, but there was little new to be said or done, and the inclination seemed to be to await the deliberations of the adjourned meeting of the London Conference. The Council voted to extend recognition to the Indonesian Republic and to call upon France to liberate the ageing Moroccan Riffian leader, Abd-el-Krim, as well as the deposed Bey of Tunis, Mohammed Moncef Pasha.

ROBERT GALE WOOLBERT.

**PANTELLERIA.** An Italian island (32 sq. mi; pop., 9,000) in the Mediterranean 45 miles from the coast of Tunisia and 62 miles from the Sicilian coast. Strategically situated to dominate the shipping route between the eastern and western Mediterranean, it was fortified by Italy during 1935-37. The island has two small ports. On June 11, 1943, the island was surrendered to Allied armed forces.

**PAPUA.** A territory (formerly called British New Guinea) of Australia, comprising the southeastern part of the island of New Guinea (87,786 square miles) and the islands of the d'Entrecasteaux, Louisiade, Trobriand, Conflict and Laughlin groups, also Woodlark. Total area, 90,540 square miles. Population (1940 estimate), 339,000, of whom 1,822 were Europeans. Capital, Port Moresby.

**Government.** The civil government is headed by an Administrator appointed by the Australian Government. The Administrator is assisted by an executive council of 5-9 members and a legislative council made up of the executive councillors and 5 unofficial members. Papua was under Japanese invasion from December 1941 to December 1942, and civil government was suspended from February 1942 to October 1945. A bill for the full restoration and improvement of civil administration in Papua was introduced in the Australian House of Representatives in July 1946 (see AUSTRALIA).

**Life of the People.** Coconuts, rubber, and sago are important products. Gold and other minerals are mined and exported. Schools are in the hands of Christian missions aided by government grants.

**PARAGUAY.** A republic of South America. Area: 60,990 square miles. Population: 1,141,332 (1945) Capital: Asunción.

The eastern third of Paraguay consists of a plateau of 1,000 to 2,000 feet elevation, to the west of which is an area of low flat plains and hilly uplands. Westward from the Paraguay River stretches the vast alluvial plain of the Gran Chaco, reaching an elevation of between 800 and 1,000 feet along the Bolivian border. The climate is sub-tropical, with considerable variation in the weather and in the amount and seasonal periodicity of rainfall.

**Population.** The population of Paraguay is com-

posed almost entirely of persons of mixed European and Indian descent. The west-central region around Asunción is the most densely populated; north-western and eastern areas are sparsely settled. The largest cities are: Asunción, 100,000; Villarrica, 50,000; and Coronel Oviedo, 30,000.

Both Spanish and Guaraní are spoken in Paraguay, but Spanish is the official language. Roman Catholicism is the predominant religion.

Recent surveys indicate that most of the population over 10 years old have at least an elementary knowledge of reading and writing. In 1944 there were 173,274 students in 1,248 primary schools; about 9,926 in 70 intermediate schools, and more than 1,000 students in the National University.

**National Economy.** Paraguayan economy is agricultural. Cotton is the leading export crop. Some tobacco is exported, and forest products, yerba maté and quebracho are exported in quantity. Sugar and rice are the chief crops grown for domestic consumption, with limited production of coffee and beans. Agricultural production figures for 1944 (in kilograms) are: quebracho, 47,266,433; sugar, 9,891,600; rice, 8,243,410. Maté production reached 16,657 metric tons.

Cattle-raising is an important industry; there are now some 5,000,000 head of livestock in the country. In 1944, about 513,200 head of cattle were slaughtered, about 69 percent for home consumption. Total slaughtering in 1944 by the three frigoríficos (principally for production of canned corned beef) totaled 161,024 head, of which 64,265 were imported.

There is little manufacturing in Paraguay, but industrial activity showed a general increase in 1944. Leading industries are: textiles, glass, and fiber hats. Foodstuffs, beverages, tobacco products, leather goods, paper manufactures, etc., are made in small quantities.

**Foreign Trade.** Paraguayan exports in 1944 were valued at 42,300,000 guaraníes (19 percent above 1943 exports) and exceeded imports by 11 percent. The value of export groups in gold reserve pesos for 1944 were: animal products, 10,483,556; forest products, 7,336,740, and agricultural products, 5,473,620. Principal exports for 1944 (in kilograms) totaled: quebracho, 27,273,701; canned meat, 14,491,724; cotton, 6,801,631; maté, 4,193,516; tobacco, 2,511,536, whole hides, 442,997; and grain, 201,737. Lumber exports (chiefly logs and beams) amounted to 6,864 metric tons in 1944; corned beef exports totaled 14,496 metric tons.

Imports were valued at 38,100,000 guaraníes in 1944, an increase of 3 percent over 1943. Foodstuffs, cotton and metal manufactures, and machinery were among the leading items imported.

**Government.** Paraguay is a centralized republic of 12 departments. Under the Constitution of 1940 a unicameral Congress of 40 members is provided for. The President is directly elected for a 5-year term, and is eligible only once for reelection. The President is aided by a Cabinet of 8 ministers. A plebiscite on Feb. 15, 1943 extended the term of President Higinio Morínigo for 5 years.

**Events, 1946.** The first signs of defection in the administration of President Higinio Morínigo occurred on June 9 when a brief report from Asunción said that two officers and three enlisted men of the Paraguayan First Cavalry Division had been killed in a clash. The Government relieved Col. Victoriano Benítez Vera, commander of the Division, of his command. On June 11 it was reported that Col. Benítez Vera had fled to the Brazilian Embassy.

The background of the clash showed that Presi-

dent Morinigo had been in conflict with Benítez Vera, who headed the Paraguayan military clique and allegedly coveted ambitions to lead the Government. When the Colonel was in Buenos Aires attending President Perón's inaugural ceremonies, President Morinigo assumed personal command of two regiments and surrounded the Colonel's unit. Benítez Vera immediately flew by plane from Argentina, but arrived too late to avoid the surrender of his unit and his own downfall.

As revolutionists in Bolivia successfully took control of their Government and killed President Gualberto Villarroel on July 21, President Morinigo indicated his desire to step down from the Presidency. At the same time, the Cabinet resigned and the National Press Association in Asunción reported that the President had invited into the Cabinet members of the leftist National Republican (Colorado) party and the Febrerista party, which had been recently restored to legal status. In later reports the President denied any intention of resigning. By August 1 the President made further concessions to political freedom by legalizing the Communist party and publicly announced that he desired to remain in power only until free elections could be held. He also said that decrees were in preparation to give a third major party, the Liberals, legal rights. The Liberal party traditionally was associated with the military, but the President said that the army was prepared to stay out of politics.

Among the political exiles who returned to Paraguay was former President José P. Guggiari, favorite of the Liberal party. Guggiari was considered an enemy, however, by the university students because of a clash between students and Guggiari's police in 1931 when demonstrating students were shot down. In a parade commemorating Guggiari's return in early September, students and Liberals met in a riot that was dispersed by the police. The result was two dead and thirty-nine injured. Public activities of the Liberal party were suspended for one month by President Morinigo. On September 25 activities of the Communist party were suspended for one month by the Ministry of the Interior on the grounds that the party had "not collaborated as a legitimate opposition."

During a meeting to resolve a Cabinet crisis, the Government claimed that an attempted coup by "anarchist elements" had been suppressed. A demonstration by university students was broken up by gunfire. By December 14 the political crisis appeared over with the Colorado and Febrerista parties accepting the army's demand that they cease quibbling and support President Morinigo until a constitutional convention was called.

**PARIS PEACE CONFERENCE.** The Paris Peace Conference—the first full-fledged peace conference following World War II—was held in Paris from July 29 to October 15. It deliberated on the peace treaties with Germany's five ex-satellites: Italy, Hungary, Rumania, Bulgaria, and Finland.

**Preparatory Work Done By the Council of Foreign Ministers.** At the Potsdam Conference which ended on August 2, 1945, President Truman, Prime Minister Attlee and Generalissimo Stalin agreed that a "Council of Foreign Ministers," composed of the Foreign Ministers of the United States, Great Britain, and the Union of Soviet Socialist Republics as well as of France and China, should "continue the necessary preparatory work for the peace settlements"; first, the Council was to frame, "with a view to their submission to the united nations," draft treaties for the allies of Germany.

At the first session of the Council (London, September 11 to October 2, 1945), the Soviet government proposed that the preparation of these treaties be entrusted, as had been done in the case of the armistices concluded in 1943 and 1944, to those countries which had defeated a given enemy State. Secretary of State Byrnes accepted the suggestion under the condition that the draft treaties thus prepared be submitted to a peace conference composed of the five Big Powers, all European members of the United Nations, and those non-European members of the United Nations "which supplied substantial military contingents in the war against the European members of the Axis." At the Moscow Conference of the Foreign Ministers of the United States, Great Britain, and Russia (December 16 to 26, 1945), it was, in essence, agreed that the treaties were to be prepared, for Italy, by the United States, France, Great Britain, and the Union of Soviet Socialist Republics; for Hungary, Rumania and Bulgaria, by the United States, Great Britain and the Union of Soviet Socialist Republics; and for Finland (with which the United States had not been at war), by Britain and Russia. Once the drafts were ready, a 21-nation conference was to be held in order to consider them, composed of China, France, Great Britain, the United States, the Union of Soviet Socialist Republics, and "all members of the United Nations which actively waged war with substantial military force against European enemy States," namely, Australia, Belgium, Byelorussian Soviet Republics, Brazil, Canada, Czechoslovakia, Ethiopia, Greece, India, the Netherlands, New Zealand, Norway, Poland, the Ukrainian Soviet Republics, Union of South Africa, and Yugoslavia. This formula (somewhat different from the one originally suggested by Mr. Byrnes) was elaborated in a note sent by the United States, on behalf of the Big Three, to France in January 1946. The note stated that the Peace Conference would hold discussions as broad as possible, and that the Foreign Ministers (of the Big Powers) when afterwards writing the final texts of the five peace treaties, would give fullest consideration to the recommendations of the Peace Conference.

It was decided at Moscow to convene the Peace Conference within four months—"not later than on May 1, 1946." However, the Council of Foreign Ministers itself did not reassemble until the end of April 1946, and needed more time than had been anticipated to find solutions for the main controversial issues. Hence, the second session of the Council (London, April 25 to May 16) was followed by a third (Paris, June 15 to July 12). By the beginning of July, the Big Four represented on the Council of Foreign Ministers had reached agreements on the principal points and had laid down their agreements in five draft treaties, for Italy, Hungary, Rumania, Bulgaria, and Finland, respectively. The draft treaties dealt with territorial questions (including the hard-won compromise on the Italian-Yugoslav frontier and on Trieste), demilitarization, reparations, and various other subjects. The draft treaties also showed the areas on which the Big Four had not yet agreed, e.g. the governmental set-up of Trieste, and certain economic clauses in the treaties with the Balkan States, such as the future regime of the Danube, and the indemnification of Allied citizens and corporations for war damages and for losses sustained by nationalization since the end of the war. Having, after arduous discussion, achieved agreement on numerous other points, the Council decided to deal with these remaining questions after, and on

the basis of, the deliberations of the Peace Conference.

Now it was possible to convene the full Conference, i.e. to call in the other Allies, because it had been agreed in Potsdam in 1945 that the Big Powers should achieve unanimity at least on the larger issues, before the draft treaties would be formally laid before the other nations.

**The Task of the Conference.** The Paris Peace Conference had to prepare, rather than to make decisions. It followed three sessions of the Council of Foreign Ministers, the proposals of which formed the basis for the discussions of the Conference; and the Conference was, in turn, followed by another session of the Council of Foreign Ministers (November 4 to December 12) at which, with due consideration to the recommendations of the Peace Conference, the final treaties were drafted. In addition to giving opportunity to China and the 16 other Allies to scrutinize, to alter, and to complete the drafts prepared by the Big Four, the Conference permitted the ex-enemy countries concerned to make their voices heard. In other words, the procedure for preparing these peace treaties consisted of three stages of which the Peace Conference was the second; and the whole procedure can be described as follows: A partnership composed of a few big and almost a score of smaller partners wished to settle its accounts with 5 opposite parties; first, the big partners made draft proposals; then the big partners called in their other partners and, as the occasion warranted, also the opposite parties for discussion and completion of these drafts; and, afterwards, sat down again amongst themselves to write the final documents, taking into account the wishes of their smaller partners and, to some extent, of the opposite parties.

As has been the case throughout history whenever a coalition of victorious nations had to translate victory into a peace settlement, delicate questions, involving not only the relations between the victors and the defeated, but the relations among the victors themselves, had to be solved. A further and special characteristic of the 1946 Peace Conference was that the enemy countries had, during the later stages of the war, "changed sides" and had, by the time of the Conference, developed ties of friendship, but of markedly differing degrees, with the various victor states, while at the same time other members of the coalition, owing to their particular experiences during the war, were slower in "forgiving." This was especially noticeable in the case of Italy, which, as an ex-enemy state that since 1943 had valuably helped the Allied cause, found herself often supported at the Conference by the United States and Britain against claims from Allied Yugoslavia, and in the case of Bulgaria, which, as one of the weakest of Hitler's former satellites and one that was at war with the Soviet Union only for a day or two, was backed by the Soviet Union against the war-time ally, Greece. Thus, the alignments in Paris were less clear-cut and more complicated than a straight division between victors and defeated would have suggested.

**Participants and Size of the Conference.** The Conference was, from its beginning, attended by all 21 nations mentioned in the Moscow agreement of December 1945. The delegations of most countries were headed by their Foreign Ministers. But during the first few days, the place of Mr. Ernest Bevin, British Foreign Secretary, was, owing to an indisposition of Mr. Bevin, taken by Prime Minister Attlee. Canada was represented by its Prime Minister, Mr. Mackenzie King, Greece's chief delegate

was her Prime Minister, Mr. Tsaldaris. General Smuts, Premier of the Union of South Africa, made an important speech to the Conference on October 7, immediately prior to the final vote-taking. The only head of state present was Mr. George Bidault, Premier-President and Foreign Minister of France. The chief associates of Mr. Byrnes were Senator Tom Connally, Democratic chairman of the Foreign Relations Committee, and Senator Arthur H. Vandenberg, spokesman for the Republican Party in foreign affairs. The highest-ranking members of the British delegation, under Mr. Bevin, were Mr. Philip J. Noel-Baker, Minister of State, and the newly-appointed Defence Minister, Mr. Albert V. Alexander. The chief deputy of Mr. Vyacheslav M. Molotov, Russia's Foreign Minister, was Mr. Alexander Vishinsky, Vice-Foreign Minister. All delegations, and particularly those from the larger countries, were accompanied by government officials, experts, consultants, interpreters, etc. Even the Committee meetings, several of which would usually take place simultaneously, were attended by 200 to 400 persons, including delegates, advisors, interpreters, secretaries, stenographers, newspaper reporters, and admitted guests. After the end of the Conference, the International Information Service stated that there were altogether 1,385 official participants at the Conference, including the secretarial staff, approximately 2,000 journalists and 1,040 guards and similar personnel. The total cost of the Conference, which was borne in its entirety by France (the host country), amounted to 136,250,000 French francs, of which 97 million were spent for materials and 28 million for wages and salaries. On particularly "heavy" days, the Conference used as much as 5 tons of paper.

During the earlier part of the Conference, it was decided to allow four countries which were not originally invited, namely, Albania, Cuba, Egypt, and Mexico to give their views on the Italian treaty. The admission of Albania (whose government was, at the time of the Conference, not recognized by the United States, Great Britain, and a number of other participants) gave rise to a vivid discussion. Austria was permitted to give her views on all five treaties.

The Conference was held at the historic Palais Luxembourg which had suffered some damage—since repaired—during the days of the liberation of Paris in August 1944. The plenary meetings took place in the "Hall of Clemenceau" where the French Senate used to convene. It seats 500 delegates in a large, elaborately decorated Amphitheatre, overlooked by a high rostrum. The Conference languages were French, English, and Russian. Hence, each speech had to be translated into the other two languages. In fact, when, e.g. Mr. Alcide de Gasperi, the Prime Minister of the Republic of Italy, addressed the assembly in Italian, three translations were needed.

The Paris Peace Conference was probably one of the most hard-working international gatherings ever held. Officials would often attend two or three meetings per day, totaling 16 to 18 hours of discussion. Many meetings broke up only in the early morning hours; some lasted, with short intervals, for 24 consecutive hours and even longer. Nevertheless, time had to be found for the receptions and parties which were tendered by the host country and by various delegations and which are always important parts of an international conference because they provide opportunities for smoothing out controversies over the dinner table.

**The Conference First Debated Its Own Rules of Procedure.** At the end of the session of the Council of

Foreign Ministers which preceded the Conference, Mr. Molotov proposed that, before sending out the invitations to the Conference, the four Ministers should agree in advance on the procedure which the conference was to follow. Thereupon, on July 9, the Council decided to suggest—but not to prescribe—to the Peace Conference, when it opened on the 29th of July, the following rules: the plenary conference should refer the detailed discussions to 9 commissions, one for each of the five ex-enemy countries, and four “functional” committees—one on military, one on legal, and two on economic matters. On the first five commissions, those States should be represented which had actually declared war on the country with which the respective committee was to deal, but France was to sit, though without vote, in all of them. The committees should decide by two-thirds majority; but each committee member whose views had not obtained such majority, should still be entitled to present his proposals to the full conference and to ask for a decision on it. The full conference should also reach its decisions by two-thirds votes, except on procedural matters where a simple majority would suffice. The four Ministers agreed “whenever possible” to support unitedly the adoption of the chief features of these proposals by the Peace Conference, but reserving the right to support any amendment passed by the latter.

On the very opening day of the Conference, a technical suggestion by the Chairman, M. Bidault, produced an immediate protest from Mr. Herbert V. Evatt, Australia's Minister for External Affairs. Criticizing the role of the Big Four in drafting the treaties, he asserted that his and other nations had the same right to participate in the final decisions on the treaties. “I do not want there to be any doubt about that.” He then demanded the simple majority rule for all deliberations of the Conference, so that any 11 votes should be sufficient to make formal recommendations to the Council of Foreign Ministers.

On the next day, July 30, Mr. Byrnes made his first address to the Conference: “At long last, we are assembled here to consider the first treaties of peace to be made since the military defeat of the Axis conspiracy to dominate the world by force. . . . Let us not, who fought on freedom's side, forget how near the shadows we came. . . . Of course, after six long years of exhaustive war, it is difficult for each nation not to think that its own ideas of peace must prevail. . . . However difficult may be the path of inter-nation cooperation, the United States is determined not to return to a policy of isolation. . . . We must work together until we find solutions which, while not perfect, are solutions which can be defended.” Then, the Secretary of State strongly stressed the importance of the preparatory work of the Council of Foreign Ministers: “If the principal allied States had not attempted to harmonize their views before this conference, I hesitate to say how many months this conference would have to go on. . . . It is not easy for any sizable deliberative body . . . to function effectively without having the measures which it is to consider drafted in advance and drafted with a view of meeting the views of those whose support is deemed essential.” Since the proposals of the Big Four represented “a very real effort to reach a common understanding,” the United States would stand by them unless the Conference should “by a two-thirds vote of the Governments here represented make a contrary recommendation”—then the United States would strive to have such recommendation adopted by the Council.

Thus, Mr. Byrnes threw the weight of the United States in the scales for a two-thirds voting procedure as proposed by the Big Four, instead of a simple majority principle proposed by Australia.

Mr. Attlee also stressed the significance of the fact that the Big Four had been able to agree on many items: “This is in itself a matter for rejoicing and not for criticism. For, quite frankly, without such an agreement the chances of producing acceptable peace treaties would have been remote.” Mr. Attlee asked the Conference not to forget that Germany and Japan, though broken, still had a very real capacity for making trouble in the case of any disunion in the allied ranks; and declared that, “having agreed to the drafts ourselves, we shall naturally support them at this Conference, but criticisms, suggestions, and recommendations made here must be given full consideration when the final drafts are framed.”

Mr. Molotov, in his first speech (July 31) reminded the Conference that the Council of Foreign Ministers had been set up upon recommendation by the United States at the Potsdam Conference of 1945. The draft treaties now submitted showed that the Council had achieved some positive results; and whereas, in the Russian view, these drafts did not adequately reflect all the just aspirations of the Allied peoples, the collaboration of the great powers should not be made the target of “reactionary” attacks. He promised that the views of the Conference “will be heard with due respect and may prove of considerable value in the final consideration of the treaties. To the voices of Germany's ex-satellites, too, we shall listen with due attention.”

These declarations by the chief United States, British and Russian delegates did not, however, satisfy the delegations of Australia and some other smaller nations. The Yugoslav speaker backed the two-thirds vote proposal, but insisted that no ethnic problem should be settled without the consent of the allied country directly concerned, and called the suggested Italian-Yugoslav frontier a negation of all fundamental principles for which the Yugoslavs had fought. A Netherlands motion that all countries (irrespective of whether they had been at war with the ex-enemy in question) should equally participate in all commissions, was defeated by 11 votes, with Great Britain, France and Russia against, and the United States abstaining. Finally, the Conference adopted Mr. Molotov's suggestion that any country which had not been at war with a particular ex-enemy could take part in the respective commissions but without voting. Also accepted was a Greek-Russian proposal to widen the scope of the Conference by permitting it to discuss any subject relating to the five treaties,—a provision which opened the way, e.g. for the keen debate, later on, about the changes of the Greek-Albanian frontier.

After several days of discussion on the voting procedure it was clear that there was considerable—though not unanimous—opposition among the smaller nations against the two-thirds rule offered by the Big Four. While none of the Big Four desired to have their carefully deliberated compromises jeopardized, Mr. Molotov fought hardest against the simple majority rule. Both sides argued that their respective standpoint was more democratic: those speaking for the simple majority rule claiming that, particularly since this was only a consultative body, the smallest participating nation should count as much as the biggest; and those favoring the two-thirds majority principle insisting that if the simple majority rule were adopted, a

combination of nations which in terms of population, and of sacrifices in winning the war and protecting the peace, represented only a small minority, could actually dominate the majority.

On August 4, Mr. Bevin proposed a compromise: decisions taken by two-thirds majority should be considered as full-fledged recommendations of the Conference to the Council of Foreign Ministers, and decisions taken by simple majority should also be sent forward for the attention of the Council. This proposal led to what was probably the most ardent debate during the whole conference. The United States and China supported the suggestion. Australia, Belgium, Brazil, and New Zealand backed a Netherlands amendment asking that the two-thirds rule should be dropped altogether. Mr. Molotov moved a third amendment; only recommendations adopted by two-thirds majorities should automatically go to the Council of Foreign Ministers; but those States that had supported a simple majority recommendation should be free to send their views as a group to the Council for consideration. On August 7, at 2 a.m., the Committee on Procedures adopted the British proposal by a vote of 15 to 6, with the Slav countries against. Two days later, Mr. Molotov's motion that the plenary session reverse the decision of the Committee on Procedure, was defeated by the same vote.<sup>1</sup>

Earlier, a New Zealand proposal that all decisions of the Conference be submitted to the United Nations for approval before being finally incorporated in the treaties, was rejected 11 to 9, with all four Big Powers voting against, and Ethiopia abstaining.

The great emphasis laid, at the beginning of the Conference, on procedural questions can also be seen from the fact that a considerable discussion ensued before they were decided (12 to 8, with one abstention) as originally planned, to have the chairmanship of the Conference rotate among the United States, Britain, France, and Russia.

The subsequent course of the Conference showed that the differences of opinion on substantive issues were not as great as the tenacity of the discussion on procedure had made anticipate. On several issues which had been left open by the Big Four, notably concerning details on the future of Trieste, the vote turned out to be mostly 15 to 6, with the Slav States in a minority of less than one third; but the apprehension lest, on the one hand, the simple majority rule would lead to the rejection, by the Conference, of the compromises previously achieved by the Big Four, and, on the other hand, that the two-thirds rule would amount to the domination of the Conference by the Slav "bloc," proved both unfounded. Above all, the fact that the Council of Foreign Ministers was able, a few weeks after the end of the Paris Conference, to agree unanimously on the final treaties, with due consideration to the views of the Conference, shows that the discussion in Paris about the relative "weight" of its various recommendations to the Council, had been dictated by precautions which, fortunately, proved too great.

**The Italian Treaty.** Of the five ex-enemy countries, Italy was the only major power. Her population exceeds that of the four others combined. She was the only European Axis member which possessed colonies. For two decades, Mussolini's Italy

engaged on militaristic expansion and was one of the disturbing factors on the world scene; but she was also the first of Hitler's allies to break away from him. Bearer of an age-old culture, and holding a central geographic position, Italy is bound to play a significant role in postwar Europe.

For all of these reasons, the Italian treaty was the most important subject of the Conference. The other four treaties intended, generally speaking, to restore the countries concerned to the position they held before the war; the Italian treaty, notably by taking away many of her island possessions and all of her colonies, changed the structure of that State, and opened up the question of future power relations in the Mediterranean and parts of Africa.

**Colonies.** How much matters had changed was shown by the fact that the largest of Italy's overseas possessions, Ethiopia (Abyssinia), conquered by Mussolini in defiance of the League of Nations in 1936, was now one of the States deliberating on the fate of Italy.

As to Italy's other African possessions, the Council of Foreign Ministers had, after discussing several schemes, compromised on the British proposal to leave the final disposition in abeyance for a time (as had been done with certain Turkish possessions after the first world war): Italy was to renounce all claims and titles to her colonies, Great Britain should continue to administer them until the Big Four agreed on their final disposition; if no such agreement was reached within one year following the ratification of the Italian treaty, the problem should be referred to the General Assembly of the United Nations.

The Conference accepted this plan but not without misgivings. Various nations expressed dissatisfaction that the question had been taken out of the hands of the Conference. In particular, the Ethiopian delegate demanded "in view of even pre-fascist Italy's imperialist record," that the Conference decide about the colonies then and there (in order to prevent Italy from being appointed trustee over any of them). Mr. Aklilu also announced Ethiopian's general claim for parts of Eritrea and Italian Somaliland—the bases for Mussolini's attack on Ethiopia. Brazil asked for the earliest granting of independence to Libya. Dr. Wang (China) demanded that self-government be granted, or promised, to at least some of the colonies, because this would inspire confidence in millions of colonial peoples elsewhere "awaiting full realization of their legitimate aspirations." The same demand was made by India, "vitaly interested in the stability of the Mediterranean and the Red Sea." Dr. Evatt (Australia) asked that the decision about the Italian colonies be made, not by the Big Four, but by all countries which had helped in liberating them (under this formula the Soviet Union and possibly the United States would not participate in the decision but Australia would, because of her valiant contribution to the British campaigns in North Africa). A representative of Egypt asked the Conference to authorize the Arab League to administer Libya, until Libya be declared independent, and to return to Egypt the oasis of Jarabub, an important center of the Senussi tribe, which Egypt had ceded to Italy in 1925.

**Island Possessions.** The Dodecanese Islands in the Aegean Sea—a group of 13 islands (not 12, as the name implies), covering approximately 1,000 square miles with an overwhelmingly Greek population of over 100,000—were "temporarily" occupied by Italy during her war against Turkey in 1912. Immediately after World War I, Italy promised Greece 12 of the islands and conditionally, even the

<sup>1</sup> Thus, the Conference acted under the following rule: "Recommendations of the plenary conference shall be of two kinds (a) those adopted by a two-thirds majority vote; (b) those which obtain a majority of more than one half but less than two-thirds of the members of the conference. Both types of recommendation shall be submitted to the Council of Foreign Ministers for their consideration."

thirteenth, the island of Rhodes. However, the final Peace Treaty with Turkey allotted all 13 islands to Italy.

Following the proposals of the Big Four, the Conference recommended the transfer of the islands to Greece, with the proviso that no fortifications be erected on them. The decision on the Dodecanese archipelago was to satisfy an old aspiration of Greece which the settlement after World War I had left unfulfilled; and to remove, thereby, an element of considerable irritation in South-Eastern Europe, aggravated by the fact that the islands lie near the Turkish mainland, midway between the Dardanelles and the Suez Canal.

The Conference also recommended that Italy cede small islands near the Albanian coast, to Albania, and certain other small islands near the Dalmatian coast, to Yugoslavia.

Whereas these questions (except the demilitarization of the Dodecanese) caused hardly any discussion, the two main issues between Yugoslavia and Italy, namely, the drawing of their new land frontier, and their respective influence on the "Free Territory of Trieste" proved to be the most formidable problems for the Conference.

**The New Italo-Yugoslav Frontier (Venezia Giulia).** In regard to the Italian mainland, the only major territorial change asked by the Big Four was the cession of the larger part of the Venezia Giulia province to Yugoslavia, and of Trieste to a new international entity, the "Free Territory of Trieste." In view of the great attention which this topic has received, the background of the question may be briefly outlined.

Venezia Giulia was the name given by Italy to a part of the territory annexed by her from the dissolved Hapsburg empire after World War I. Bordering in the East on Yugoslavia and in the South on the Adriatic, it covered about 4,000 square miles. Its population, partly Italian and partly Slav (Croats and Slovenes)—with the Italians mainly inhabiting the cities and the Slavs living mainly in the countryside surrounding these cities—was about one million. The principal city of the region, Trieste, is, after Venice, the most important port of the Adriatic and, until 1918, was the main port of the Hapsburg Empire. This is historic soil; under the name of Tergeste, the port was important even in Roman-Illyrian times. Almost as soon as Italy achieved unification (1870), the "irredenta movement"—a systematic propaganda and agitation campaign for the secession of these parts from the Austro-Hungarian monarchy—was started both within the (then Austrian) region as well as from Italy across the border. It was crowned with success when, in 1919, the territory fell to Italy. However, a similar though less vociferous claim had also been laid on this remarkably beautiful piece of land by the nationally conscious Slavs of the region who, in turn, were backed by their brothers living in Serbia across old Austria's South-Eastern border. It is not forgotten that the shots fired in the Bosnian city of Sarajevo by a South-Slav extremist against the heir of Hapsburg's throne, led to the outbreak of World War I in the summer of 1914.

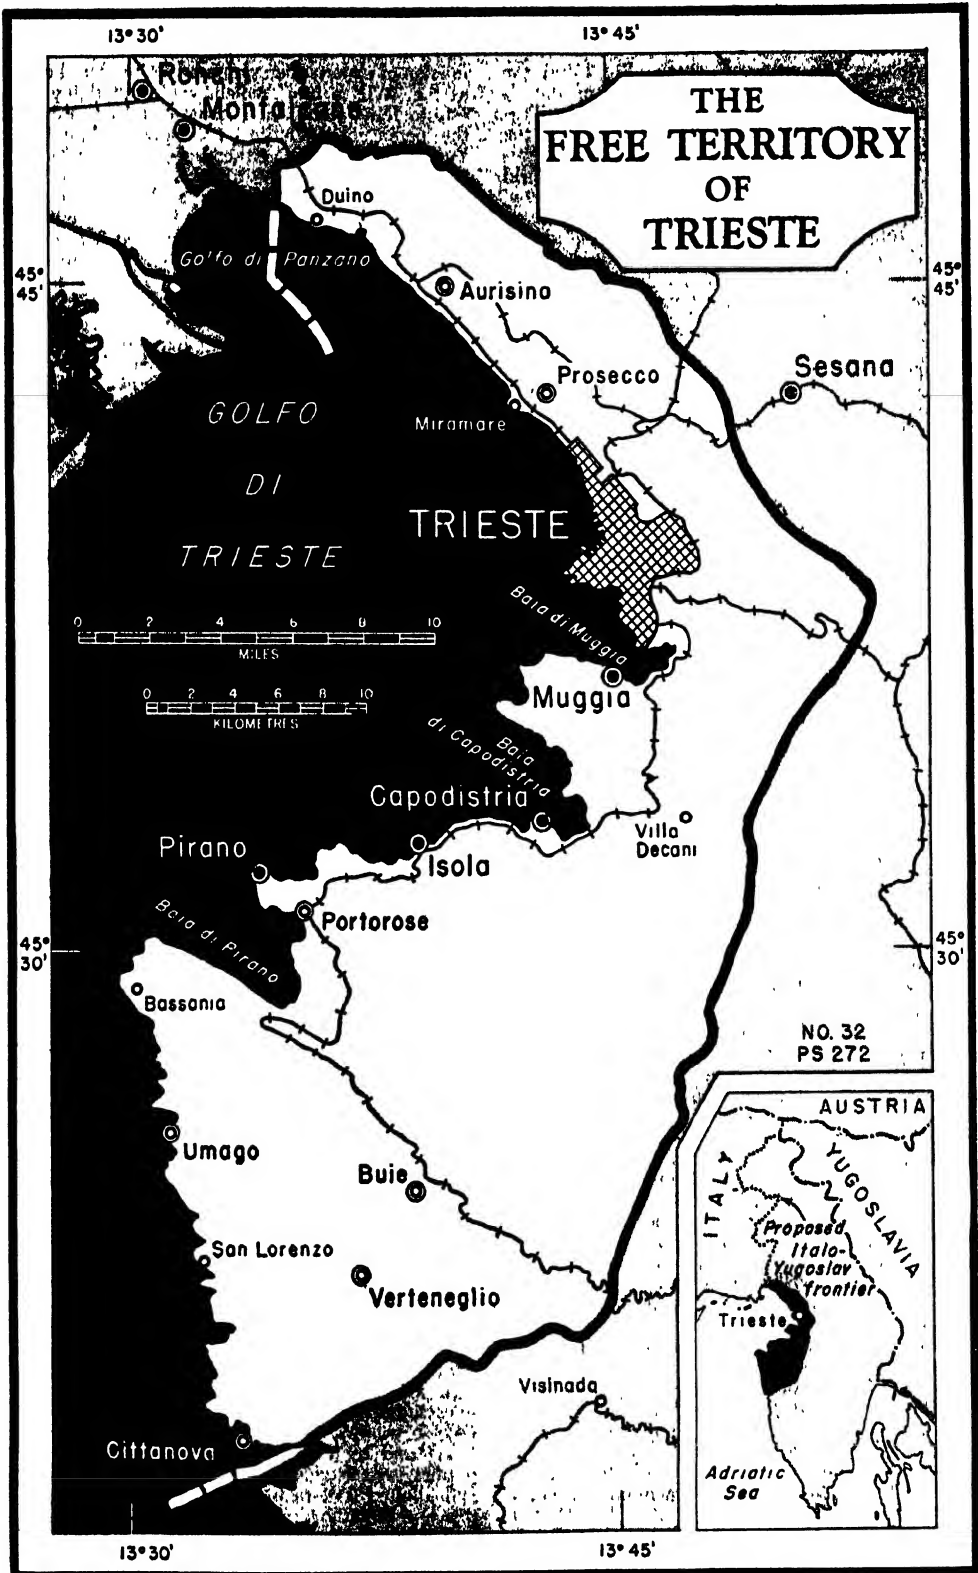

In April 1915, a secret treaty was signed in London between Great Britain and Italy, after consultation with France and (Czarist) Russia, in which Italy was promised, as prize for entering the war on the Allied side, very large territorial gains from the Hapsburg Empire, including Venezia Giulia, Trieste, Fiume and Dalmatia. The United States was not a party to the treaty; in fact, President Wilson learned of its existence only when ar-

riving in Paris for the Peace Conference in 1919, and immediately protested against it as contrary to national self-determination. An American commission of experts then proposed a boundary known as the "Wilson line" which, while adjudging Trieste to Italy, would have given about one third of the peninsula, including the port of Fiume, to Yugoslavia. In 1919, neither Italy nor Yugoslavia—both were then on the allied side—accepted the Wilson line. Italy asked for a boundary farther East; Yugoslavia demanded, as in 1946, the whole of Venezia Giulia. Their views proved irreconcilable. The Peace Conference of 1919 had to close without solving the question. More than a year later, an attempt at solving it was made, after prolonged direct Italian-Yugoslav negotiations, in the Italian-Yugoslav Treaty of Rapallo. That treaty granted Italy less new territory than she had secretly been promised in 1915, because it allotted Dalmatia (except the city of Zara) to Yugoslavia; but it gave Italy very considerably more than the 1919 Peace Conference had been willing to concede her, and over 250,000 Slavs came thus under Italian domination. Concerning Fiume, third-largest Adriatic port, the Treaty of Rapallo provided that it would be a free city, independent of both Italy and Yugoslavia, under the supervision of the League of Nations.

Yet, a few weeks after the signing of the Treaty of Rapallo, the Italian poet and friend of Mussolini, Gabriele d'Annunzio, at the head of a group of fascists, conquered Fiume by a coup, and Fiume was annexed to Italy. After the Fascists came into power in Italy, they carried out a regime of suppression against the Slav minority. In World War II, Italy launched the invasion of Yugoslavia from this region, and subjected the parts of Yugoslavia which she occupied, to even worse violence.

Thus, if the question of the Italo-Yugoslav frontier proved hard to solve at the 1946 Peace Conference, it should be remembered that it formed an even more difficult question after the first war—so difficult, indeed, that the 1919 Peace Conference (at which Russia did not participate) had to give up on this point, and that the intervening years had seen a serious deterioration of Italo-Yugoslav relations. The Conference acknowledged that the Italian Republic of 1946 could not be blamed for the wrong wrought by Mussolini's Italy on her Eastern neighbor; but several delegates were reminded of the case of Fiume, and it was also pointed out that the Fascist party had gained power in 1922 when it held a mere 35 seats out of the 574 in the Italian Parliament.

The injustice of the frontier, as it existed between the wars, has been widely admitted, and when the Foreign Ministers of the Big Four came to discuss the topic, they readily agreed on the principle that Yugoslavia should acquire a considerable part of Venezia Giulia; but it was more difficult for them to find a mutually acceptable line. In the end, they agreed to recommend to the Paris Peace Conference a line which approximately followed what has become known as the "French line" because it was proposed by Mr. George Bidault, the French member on the Council of Foreign Ministers. It is a compromise between the lines suggested by the Americans and the British (which would have drawn the frontier farther East) and by the Union of Soviet Socialist Republics (which would have drawn it farther West and allotted Trieste to Yugoslavia). According to this line Yugoslavia was to receive, from the territory which Italy had acquired from Austria after the first world war, an area of about 3,000 square

miles with a population of about half a million, of whom three quarters (376,000) were estimated to be Slavs and the rest (128,000) Italians. According to the same compromise, the center of the region, Trieste, was to be given neither to Italy nor to Yugoslavia; instead, an area of about 300 square miles, including the city and harbor of Trieste, with a mixed Italo-Slovene population of some 320,000 (the majority, Italians), was to be carved out of the territory and made into the "Free Territory of Trieste."

**The Statute (Constitution) of the Free Territory of Trieste.** After compromising on the creation of the "Free Territory of Trieste," the Council of Foreign Ministers did not draw up detailed plans concerning its governmental structure; it merely recommended that the integrity and independence of the Territory be guaranteed by the Security Council of the United Nations, that the Security Council was to appoint the "Governor" of the Territory; and that the "Statute" (constitution) of the Territory should provide for the establishment of a legislative and executive authority "on democratic lines." Beginning on September 13, 1946, the Italian Territorial and Political Committee endeavored, for more than 3 weeks, to fill this rather loose frame for the constitution of the first "Free Territory" to be set up under the auspices of the United Nations.

Yugoslavia, bitterly disappointed that her claim for the whole of Venezia Giulia had been cut, and for Trieste rejected, made vigorous efforts to persuade the Committee that the Free Territory should be connected with her by a customs union, and similar administrative ties; that Yugoslavia should have the right to designate the governor for Trieste, and be responsible for the conduct of the foreign affairs of the Territory. Her main arguments were that the prosperity of the port would depend on its close connection with Yugoslavia, its main hinterland, and that she had far greater interest in Trieste than Italy, because Yugoslavia possessed no other harbor which she would be able to develop, whereas Italy possessed a number of first-class harbors, and, in fact, Trieste had withered during the 25 years of Italian administration. The Czechoslovakian delegate declared that his country, as a principal user of Trieste and interested in its tranquillity, would have considered as the best solution to make Trieste a federal unit within the Yugoslav Federation. Since this was not desired, a customs union between Trieste and Yugoslavia, the common administration of the railways, and the participation of Yugoslavia in the choice of governor should be guaranteed. It was clear from the outset that many—but not all—of Yugoslavia's demands regarding Trieste were backed by Czechoslovakia, Poland, the Soviet Union, Byelorussia, and the Ukraine, but that they were opposed by the other participating countries.

It is to be noted that on these points, the Conference had at its disposal few recommendations of the Big Four, and that it was just here, in the endeavor to fill out the details for the Big Four's basic plan for Trieste, that bitter arguments arose. Evidently, the debate was more heated than the intrinsic significance of the questions would have warranted; and this was so because, behind the arguments, lay the fear lest Yugoslavia would gain predominance in the strategically located port and, thereby, somehow pave the way for Russia's penetration into the Adriatic; and, on the other hand, the fear lest Trieste might somehow become a military outpost of Western "capitalism" at the very flank of the Balkans.

The main bone of contention was the distribu-

tion of powers between the Governor on the one hand, and the Legislature (Parliament) of Trieste on the other. What prerogatives should the Governor, who was to be elected by the Security Council, possess? To what extent, and under what safeguards, should he have the right to veto the decisions of the popularly elected Assembly, and to dissolve it? Should he have the power to rule by decree? Should the police be under him, or under the Government of the Territory? The Conference had only one precedent to look to, namely, the Free City of Danzig which was administered under the auspices of the League of Nations. The day-to-day administration of that Baltic port confronted the League with many a complex problem; and in the end, the safeguards in the Danzig Constitution had proved too weak to withstand the pressure of the Nazis outside and inside the region.

The conclusions to be drawn from the Danzig experiences differed widely, e.g. the French delegate, disagreeing with Czechoslovakia, asked for a system which would combine true sovereignty of the Territory with the principle of supervision by the Security Council. The Australian delegate expressed grave doubts that the Security Council would be able to guarantee the integrity and independence of the Territory, as demanded by the Big Four; instead, all signatories to the peace treaty should pledge themselves to respect the independence of the Territory. The British delegate asked, on the contrary, for the widest possible powers for the Governor as the representative of the Security Council. The view of the United States was succinctly summed up by Senator Connally: "In our conception, the Governor is the agent of the Security Council in the free territory. He can in no sense, as has been suggested, be regarded as a dictator or as the agent for any foreign group of powers striving to use Trieste for their own ends. . . . He is the instrument of the international organization charged with the maintenance of peace and security. He must have sufficient powers to fulfill his responsibilities." Mr. Molotov proposed a nine-point program for the administration of Trieste (September 14): (1) The Free Territory must be completely demilitarized and neutral; (2) All foreign troops must leave the Territory within 30 days after the signing of the treaty; (3) In order to foster the economic prosperity of the Territory there should be close economic collaboration with Yugoslavia, through a customs union, common currency, common administration of railroads, etc.; (4) All countries should receive the same rights in the port of Trieste, but Italy and Yugoslavia should receive "free zones" within the limits of the port; (5) The task of the Governor should be to guarantee the observance of the "Statute" of the Territory; (6) The legislative authority should be exercised by popular Assembly, elected by secret, general, direct, and equal suffrage on the principle of proportional representation; (7) The executive power should be exercised by the Government of the Free Territory, elected by the Assembly and responsible to it; all branches of the administration of the Territory, including the border police and the coast guard, should be under that Government; (8) Italian citizens residing in the Territory on and since June 10, 1940 should acquire citizenship of the Territory; however, various categories, such as active members of the Fascist Party, war criminals, etc., should be excluded; (9) As a transitional measure, a commission of the Big Four should appoint a provisional government which, in turn, should arrange for elections of the Assembly within three months.

Two of these proposals were accepted without opposition; that the Governor should be responsible for safeguarding the observance of the constitution of the Free Territory; and that legislative authority should rest with a popular Assembly freely elected by proportional representation (on the second point, Canada, Great Britain, Greece, India, and New Zealand abstained). Mr. Molotov's point no 2 (withdrawal of the American and British occupation forces from Trieste) was defeated; instead, it was decided by a vote of 15 against 6 that United States and British troops would be entitled to stay in Trieste until the Security Council would decide on a date for their withdrawal. Otherwise, and on the hotly debated question of the prerogatives of the Governor, a number of clauses were adopted as put forward by French compromise proposals and summarized as follows in the just-mentioned speech by Senator Connally: "The recommendations propose the establishment of a thoroughly democratic government—the Governor under the direction of the Security Council is to preserve the territory's integrity and independence and to preserve public order and the rights and freedoms of the inhabitants; his powers are delimited. A legislative assembly elected by the people through universal suffrage without discrimination is to be established. It has wide powers. It elects the Council of Government and enjoys legislative authority. It may file protests with the Security Council against any act of the Governor. A system of independent courts is set up to administer justice according to law. The French proposal sets up a plan which assures the people a free and independent governmental system under which Trieste and its people will be able to prosper and progress and develop."

Yugoslavia (whose government and opposition parties were united in their demand for Trieste) and the other five Slav participants of the Conference did not see it in this light. For the final vote-taking, in the plenary session, the rules of the Conference permitted the re-introducing of amendments even if they had been rejected in committee, and the calling for a separate vote on each subsection of any treaty article. Hence, more than 30 votes were taken on Art. 16 (dealing with Trieste) until it was accepted as a whole, 15-6.

**Territorial Concessions to France.** As suggested by the Council of Foreign Ministers, the Conference agreed on the cession to France of small areas on Italy's northwestern border, one in the Mount Cenis region, and the others around the little towns of Briga and Tenda, near Nice; the latter region contains hydro-electric developments, and France was to be required to safeguard Italian interests in the sources of the electric power.

**Italo-Austrian Agreement on the South Tyrol.** During the months preceding the Peace Conference, high hopes were aroused in Austria by the allegation that Italy (which had received this Alpine region, famous for its grandeur, in 1919) would be asked to return the part of South Tyrol which is inhabited by approximately 250,000 German-speaking persons. But by the time the Austrian Foreign Minister, Mr. Gruber, was permitted to address the Conference, he no longer entertained these hopes and merely pleaded for a solution which would be freely acceptable to the inhabitants of the South Tyrol "who still considered themselves Austrians." Encouraged by the United States and other Allies, the Austrian and the Italian delegations then entered into direct negotiations on administrative and other problems in the South Tyrol, which led to an Italo-Austrian agreement signed on September

15, 1946. The Agreement was officially hailed by Secretary of State, Mr. Byrnes, as a constructive step toward amicable relations between Italy and Austria; and upon a Belgian-Netherlands motion, the Italian Territorial and Political Commission recommended that it be incorporated into the Italian peace treaty; the six Slav States voted against, arguing that Austria should not enter into an international agreement of this sort before her own peace treaty had been signed.

**Reparations and Restitution.** Contrary to expectation, the financial clauses of the Italian treaty caused comparatively few difficulties. The Council of Foreign Ministers submitted only one specific proposal, namely that the Soviet Union should receive \$100,000,000 from Italy, in partial reparation for the damages (estimated by the Union of Soviet Socialist Republics at six and a half billion dollars) inflicted by Italian troops during the invasion of the Ukraine, but left it to the Conference to consider the reparations claims of other countries attacked by Italy, such as Greece, Yugoslavia, and Ethiopia. The United States and Britain, while recognizing that the damages inflicted by Italy were far higher than the claim made by the Soviet Union, strongly backed Italy's plea to reduce the reparations sum in view of Italy's bad economic condition, and pointed out that they themselves did not ask for any reparation although the United States and Great Britain would be able to put forward claims for twenty and twelve billion dollars respectively, as the cost of their military operations against Italy. The Italian ambassador in Washington, Signor Tarchiani, asked the Italian Economic Committee to set the reparation total not higher than three hundred million dollars; to give preference to payment in goods; and to distribute the reparations fairly over a definite period of time. These requests were practically met; in accordance with a British proposal, the Conference recommended unanimously to assess one hundred million dollars reparations each to the Union of Soviet Socialist Republics, Greece, and Yugoslavia, and twenty-five million dollars to Ethiopia, as far as the reparations for Russia were concerned, they should come out of Italy's current industrial production with Russia supplying the raw materials, and should be distributed over seven years. The Yugoslav motion to fix Italy's reparations to Albania at twenty-five million dollars was defeated by a vote of 12 to 6; instead, it was decided to leave the determination of Albania's claim to the Council of Foreign Ministers.

From the question of reparations—indemnification for damages suffered by the attacked nations on their own territories—must be distinguished the question of restitution—indemnification for damages suffered by the attacked nations within the territory of the aggressor nation itself. On the latter point, the Council of Foreign Ministers had not found an agreement. Instead, two proposals were submitted to the Conference; one, sponsored by the United States, calling for compensation, at 100 percent of the cost of replacement, to owners (if they are citizens of a United Nation) of lost, destroyed, or damaged property. The other, put forward by the Union of Soviet Socialist Republics, asked for analogous compensation to the extent of 33 percent. At the Conference, the United States proposed a reduction to 25 percent compensation, but argued that United Nations citizens "who held property in Italy through the medium of corporations organized under Italian law"—e.g. Italian corporations owned by American interests—should be treated in the same way as United Nations citi-

zens "who held property in Italy directly." On a basis of a compromise again suggested by France, the compensation for Allied property was fixed at 75 percent of the damage. This formula was adopted not only for Italy but for all five ex-enemy countries. In view of the comparatively heavy capital investments, especially of American, British, and French interests, in Italy and the Balkans, computations made at the Conference showed that the obligations of the ex-enemy countries under the title of restitution of property would greatly exceed the payments to be made under the title of reparations. The Conference also accepted an Article authorizing any Allied Power to seize Italian property (whether property of the Italian State or private Italian property) within its own territory up to the limit of any claim presented by an Allied Power, other than claims covered by the provisions concerning reparations or restitution.

One important question which was particularly stressed by the Italian Prime Minister, Signor de Gasperi, when he addressed the Conference, was not settled in Paris: should Italy be allowed to demand reparations from Germany, and if so, in what manner and to what extent? The Italian Government provisionally estimated Italy's claim at over two hundred billion lire—a sum exceeding many times the reparations demanded from Italy.

In the light of this problem—which grew out of the fact that Italy, at first Hitler's strongest European Axis member, in 1943 declared war on Germany, while in the North of the country Mussolini's "Fascist Republic" fought with the Nazis against the Allied Armies and the Italian partisans—it is understandable that the wording of the preamble to the Italian treaty caused a great deal of discussion at the Paris Conference; the question was how to assess, in the preamble, on the one hand the measure of war guilt of Fascist Italy, and, on the other, the recognition of post-fascist Italy's services to the Allied cause. It was remarkable that, despite the deep bitterness still alive in the countries which had experienced the weight of Italy's aggression, the Conference was able unanimously to adopt a revised preamble which, later, may provide important clues for the answer to such questions as the right of the new Italian Republic to demand reparations from Germany. See **REPARATIONS**.

**Military Clauses.** On the other hand, the Conference was unanimous in its determination to ask for Italy's demilitarization. In accordance with the recommendations of the Big Four, it decided, with no dissenting vote, to recommend the reduction of Italy's army (including the Carabinieri corps) to 250,000, her air force to 25,000 and her navy (which henceforth is to consist only of two small battleships, four cruisers and some smaller craft) to 22,500; she is to be allowed a maximum of 200 medium and heavy tanks, no submarines, no bombing aircraft. The frontier areas with France and Yugoslavia must be demilitarized to a depth of 12 miles, extensive other land areas and all her islands must be wholly or partially demilitarized.

**The Final Vote.** The plenary session took more than 80 votes on the Italian treaty; the procedure lasted from 3 p.m. on October 9, until the wee hours of October 10. On many important issues (all financial and military clauses; Italy's renunciation of her colonies; the transfer of the Dodecanese Islands; the preamble to the Treaty, etc.) the vote was unanimous. However, on most clauses which had remained controversial, first of all on Trieste, the vote was 15 to 6, with Czechoslovakia, Poland, Yugoslavia, and the three Soviet delegations on the

losing side, but the Union of Soviet Socialist Republics carefully avoiding to vote against provisions it had consented to in the Council of Foreign Ministers and, therefore, repeatedly voting against Yugoslav amendments. Yugoslavia was especially dissatisfied with the clauses granting extensive powers to the Governor, and the obligation imposed upon her to grant political liberties to all persons in the territory to be ceded to her, a provision which she called "an offense," since these rights were contained in her constitution. It was clauses such as this which induced Yugoslavia to declare that she would be unable to sign the treaty unless modifications were made.

**The Rumanian, Bulgarian, Hungarian, and Finnish Treaties. Territorial Provisions Concerning Rumania.** The evaluation of the changes recommended by the Conference, following the draft of the Big Four, in the map of Rumania depends on whether a comparison is made with her size before the first world war, or between the wars, or at the time of the peak of Hitler's power. The territory conceded to her in Paris is considerably larger than that which she possessed in 1914 because the rich land of Transylvania (22,300 square miles, 3,200,000 population)—which she received from Hungary in 1919 but four-fifths of which (17,300 square miles, 2,400,000 inhabitants) Hitler "awarded" back to Hungary in 1940—was again allotted to Rumania. However, Bessarabia (17,300 square miles) and Northern Bukovina (2,000 square miles) with a combined population of 3,750,000 which Rumania held between 1919 and 1940 were to be left with Russia, and the often-contested province of Southern Dobruja (3,000 square miles, 410,000 population) which had formed part of Rumania between 1913 and 1940, was to be left with Bulgaria.<sup>2</sup> Thus, Rumania would now be larger, by the four-fifths of Transylvania (17,300 square miles), than she was during her alliance with Hitler when she had to cede that area to Hungary; and this addition would offset the loss of the far less developed and fertile regions of Bessarabia and Northern Bukovina (together 19,200 square miles). On the other hand, Rumania would by those 19,200 square miles be smaller than at the time of her greatest expanse, i.e. between 1919 and 1940 when, due to the weakness of Russia at the aftermath of World War I, Rumania had been able to annex Bessarabia from Russia, and Northern Bukovina, with a preponderantly Ukrainian population, from the remnants of the Hapsburg empire. In other words, Rumania (which in World War I sided with, and in World War II against the Allies) was allowed to keep the more valuable half of the gains she had made after the World War I.

It is noteworthy, in view of the complicated ethnical situation and the strength of national aspirations in South-Eastern Europe, that the Peace Conference was able to reach unanimous agreements on all those clauses.<sup>3</sup>

**Territorial Provisions Concerning Bulgaria.** The Bul-

<sup>2</sup> Rumania ceded the Southern Dobruja to Bulgaria in 1940. The Peace Conference approved of the deal because it makes the Danube the frontier between the two countries. As long as Rumania possessed not only the northern but the southern bench of the Danube (on which Southern Dobruja is situated) she was theoretically in a position to close the mouth of the river.

<sup>3</sup> The Conference, after careful consideration, rejected, first, a Hungarian demand for a section (8,000 square miles) of Transylvania and, afterwards, a Hungarian compromise proposal for a border rectification by which Hungary would have gained an area of approximately 1,500 square miles inhabited by approximately 500,000 of whom, she claimed, 67 percent are ethnically Hungarian. In the final vote on Transylvania, Australia, and South Africa abstained.

garian territorial clauses proved to be more controversial, although the areas involved were very much smaller. In the end, only one change was recommended with respect to that country, namely the just-mentioned consent to the transfer of the Southern Dobrudja from Rumania to Bulgaria.

The controversies flared up over a Greek request for a border rectification from Bulgaria, and a Bulgarian demand for a border rectification and access to the sea at the expense of Greece. These discussions were strongly colored by the fact that the Greek situation formed one of the most controversial topics of world politics in 1946 (while the Conference was sitting in Paris, the Security Council in New York rejected a Ukrainian complaint against Greece, charging that the "irresponsible" policy of the Greek Government had created a "situation" which gravely endangered the peace and security in the Balkans; see articles on GREECE and UNITED NATIONS).

Although representing an ex-enemy country, Bulgaria's Foreign Minister demanded as "legitimate and vital" the "restitution of Western Thrace" which would give his country an outlet on the Aegean Sea (the Treaty of Bucharest [1913] did, in fact, allot Western Thrace [the provinces of Rodopi and Evros] to Bulgaria). The claim was backed by the Union of Soviet Socialist Republics (Mr. Vishinsky quoting Mr. Winston Churchill's previous support for Bulgaria on this point), Poland and the Ukraine, but repudiated by most of the other member states; Prime Minister Tsaldaris of Greece called it, with "profound indignation" a "recrudescence of Bulgarian expansionism." Greece, in turn, strongly backed by Great Britain, asked for about 800 square miles of Bulgarian territory, inhabited by about 40,000 people, in order to improve her defensive position against Bulgaria which "had attacked her thrice during this century." This brought forth the accusation that Greece was "stretching her avid hand toward Bulgaria's capital" (since the end of the war, street demonstrations in Athens frequently clamored for "Sophia"), and that the new "Bulgarian people's democracy" was treated with undeserved hostility by the Western Powers although it could not be made responsible for the deeds of "the criminal band entrenched round the Bulgarian throne." Before the final vote was taken on the Bulgarian treaty (October 11), Mr. Caffery, United States ambassador to France, declared that the United States, after long consideration, rejected the Greek demand because her border could better be safeguarded by prohibiting Bulgaria to install long-range weapons along that frontier, and that, first of all, the territorial integrity of Greece was well protected by the United Nations. Yet, the full Conference overruled both the Council of Foreign Ministers and its own Bulgarian Committee when only 9 States (including France, United States and Union of Soviet Socialist Republics) voted in favor of leaving the Bulgarian-Greek frontier unaltered (thus dismissing both the Greek and the Bulgarian claims), but all other 12 nations (including Britain and Greece) abstained.<sup>4</sup> Thereupon, Mr. Byrnes, in the chair, announced that the question would have to be dealt with again by the Foreign Ministers of the Big Four.

**Greek Territorial Claims Against Albania.** The Conference having authorized the participating States to raise matters not directly arising out of the peace

treaties, Greece formally submitted to the Conference a demand for the southern third (3,000 square miles) of the territory of her northwestern neighbor, Albania. Greece had asked for this area, known as "Northern Epirus," ever since 1878, decades before Albania gained independence from Turkey in 1912, and with special emphasis at the 1919 Peace Conference which ended in a stalemate on the question. In fact, not until seven years after the end of the 1919 Conference were the Albanian frontiers defined in an international treaty to which Greece was, however, not a signatory. That treaty left the southern part of Albania which Greece had demanded, to Albania, after a neutral Commission of Inquiry of the League of Nations had reported that "an independent Albania is only possible if the Southern provinces are included."

At the 1946 Peace Conference Albania emphatically rejected the Greek claim and, on the contrary, asked, for ethnic reasons, that some Greek territory beyond the present border be adjudged to Albania. While not succeeding with her own claim, Albania scored the success that, on September 26, after a vigorous debate lasting over three weeks, the Conference decided not to take any action on the Greek-Albanian border.

**Territorial Provisions Concerning Hungary.** Apart from the return of Transylvania to Rumania (see above) the only matter before the Conference involving Hungarian territory was a Czechoslovak demand for a small stretch of land (5 villages, population 8,000) on the right bank of the Danube opposite Bratislava. The proposal was dictated exclusively, the Czechoslovak delegate declared, by stringent economic considerations. Czechoslovakia has no access to the sea; her only important Danube port is Bratislava where a winter harbor is vitally needed; but there was not sufficient room for it on the Bratislava (left) side of the river, and, therefore, the demand for the necessary space on the right bank. After considerable discussion, in the Hungarian Committee and in a special subcommittee, the Czechoslovak proposal was accepted by the Conference without a vote.

**Transfer of Hungarian Minority from Czechoslovakia.** Ever since Czechoslovakia was founded in 1918, she was the target of militant revisionist propaganda from her German and Hungarian minorities (supported, respectively, by Germany and Hungary)—movements which led, after the Munich pact of 1938, to the dismemberment of Czechoslovakia and the annexation, by Hungary, of the major part of Slovakia. The draft treaty of the Big Four declared that annexation null and void. The Conference accepted two Czechoslovakian amendments, one establishing Czechoslovakia's claims against Hungary for economic and financial damages resulting from the Hungarian occupation, and the other forbidding Hungary to make revisionist propaganda, "especially" if "aimed at Hungary's neighbors." Violations of this provision shall immediately be brought to the attention of the Security Council of the United Nations by Hungary's neighbors.

But in view of her experiences, Czechoslovakia asked for a clause permitting her to hand over to Hungary up to 200,000 persons of Magyar extraction. A vivid debate followed. Hungary pleaded for the rejection of the proposal; Czechoslovakia insisted on the irritation caused by the unassimilable part of the Hungarian minority, emphasized the brutalities committed by the Hungarian army in Slovakia, and assured the Conference that the transfer would be carried out humanely and, if desired, under United Nations' supervision. Endorsed by

<sup>4</sup> Commenting on this vote in the House of Commons on October 22, 1946, Mr. Bevin declared that "we and a number of other delegations felt that the claims of Greece had not been studied sufficiently and that a final decision should be deferred."

Mr. Vishinsky, Czechoslovak Foreign Minister Mr. Masaryk pointed out that Hungary had begun to send her German minority of 500,000 to Germany, and should therefore receive her fellow-Hungarians with open arms. The United States and British delegates, expressing their appreciation of Czechoslovakia's desire to solve the minority problem once and for all, objected to the compulsory transfer and recommended direct Czecho-Hungarian negotiations. Czechoslovakia accepted the suggestion and withdrew its amendment, for which she received warm praise.

**Territorial Provisions Concerning Finland.** When, in September, 1944, Great Britain and the Soviet Union concluded an armistice with Finland, it was understood that the final peace treaty would contain virtually the same conditions as that armistice. Accordingly, and in conformity with the draft of the Council of Foreign Ministers, the Finnish Committee (in which the United States, not having been at war with Finland, was not represented) recommended the cession, to Russia, of the Karelian Isthmus above Leningrad, and of the arctic port of Petsamo; in the Baltic Sea, the Soviet lease of the naval base at Hangö was to be renounced (as also provided in the armistice) in exchange of similar rights at Porkkala. When the Finnish treaty came to a vote at the last working day of the Conference (October 14) Mr. Bevin declared to propose no change. Senator Vandenberg criticized the territorial provisions, which then were carried by a vote of 20 to 0, with the United States abstaining.

**Navigation on the Danube.** At 9 a.m. on October 10, only six hours after finishing the vote on the Italian treaty, the plenary session started the final debate on the Rumanian treaty. Characteristically, it centered around Art. 34, providing for free navigation and commerce on the Danube, unrestricted by customs or other barriers set up by the countries on its banks; and upon the proposal to hold, within six months of the signing of the treaty, a conference of the four Big Powers and the riparian States to draw up a Danubian Convention. These clauses, and (on the following days) analogous clauses in the Hungarian and Bulgarian treaties, were carried by more than a two-thirds majority against the opposition of Russia (which, through the reacquisition of Bessarabia, has become a riparian State) and the two other participating Danubian States, Czechoslovakia, and Yugoslavia. Bulgarian, Rumanian and, to a lesser extent, Hungarian opposition was also noticeable, but could not, of course, be expressed in the vote since ex-enemy States had no vote.

After Trieste, the question of the "Free Danube" was the most controversial of the Conference. Hence, some of the declarations made on October 10 may, as typical of numerous speeches on the subject, and of the whole atmosphere of the Conference, be briefly quoted:

Senator Vandenberg stated that a free Danube was indispensable to the economic health and, therefore, the peace of Central Europe. The United States had no direct commercial interest in the river, but had a temporary responsibility on account of the occupation of two Danubian States, Austria and Germany. That Danube commerce could not prosper if at the mercy of discriminatory administration, had been recognized since 1856 and even before, when international administration had been set up. Not to establish it now would be a step backward. "If we intend that the Danube shall resume the freedoms heretofore established and shall develop in peace and progress, this Con-

ference must say so now. . . . We shall not collide with any Danubian aspirations unless these aspirations collide with these freedoms. In such an event it is doubly necessary that we should anticipate the protective contract now."

Mr. Kardelj, Yugoslav Foreign Minister, declared that Yugoslavia was more interested in the Danube than any other country because almost half of the navigable Danubian system lay within her border. She "absolutely rejected" the proposals adopted in Committee by the votes of countries thousands of miles away from the river while the participating Danubian countries voted against them. The so-called principle of freedom of Danubian navigation has long since become "a vestige of the state of dependence and oppression in which the Danubian countries used to live." Now, these "dishonorable remnants of the past must not be allowed to continue."

Mr. Bevin called it "both unfair and unjust" to assert that Britain was seeking Rumania's "economic enslavement" by merely insisting that Britain be given exactly the same treatment as others. Nothing would do more to remove the suspicions concerning Russia's designs in that part of the world, and to remove the division between East and West which Mr. Molotov had called an absurdity, than acceptance of the freedom of Danubian navigation on equal terms.

Mr. Molotov replied that freedom of navigation should not be limited to the Danube and not dealt with in the peace treaties, but that the matter should be considered on a world-wide basis. Alluding to the Dardanelles (from the administration of which the Soviet Union is excluded), he said that "there are also sea rights" and rights of passage through waterways connecting seas, which are of greater importance than rivers, e.g. the Suez Canal and the Panama Canal. Also, the powerful States should not take advantage of the postwar difficulties of the poorer countries, either "under the guise of equal opportunities or of dollar diplomacy. Private capitalists can become the ventable owners of whole states where they can do what they wish as a result of the power their Dollars give them." The regime established for the Danube 90 years ago was "a typically imperialistic policy of the 19th century" which should not survive. Now to advocate a river regime to which the smaller Danubian States were opposed, was inconsistent with the principles of democracy.

Behind the controversy lay the fears, on the part of the Western Powers, lest, without joint action, the Soviet Union might achieve undue preponderance in the administration of the Danube and, thereby, in the economic and political development of the Danubian area; and lest the socialistic trends in those regions would lead to discrimination against Western capital and business. On the other hand, the countries immediately concerned were apprehensive that the prohibition of "barriers" would infringe upon their sovereignty, and result in too strong economic, and therefore political, influence of the Western Powers.<sup>5</sup> Russia also appeared to feel that, the Danube being the highway to the Black Sea (the mouth of the Danube is only a few hundred miles from Odessa) it could conceivably become the highway of aggression against her. Yet, as, e.g. the London *Observer* of October 12, 1946, pointed out, the Peace Confer-

<sup>5</sup> In that connection, the Slav countries time and again criticized the United States for holding the 800 Danube barges removed by the Nazis, the majority of which belonged to Yugoslavia, and alleged that this United States policy aimed at exercising pressure on the Danubian States.

ence did not discuss the *nature* of the contemplated "internationalization" of the Danube, and left, therefore, much room for compromises.

**Reparations and Economic Provisions.** Following the armistice agreements, the Big Four had set the reparations for Russia at \$300 million each from Rumania, Finland, and Hungary; in addition, Hungary should pay \$50 million each to Czechoslovakia and Yugoslavia. An Australian proposal to make the Rumanian reparations payable, not in commodities but in foreign exchange, met with strong Russian opposition and was defeated. The United States, in the words of Senator Vandenberg, did not desire to take from any Ally "one penny of the pitifully small percentage of reparation which it is wise for them to collect;" yet, in view of Finland's and Hungary's economic weakness, the United States advocated a reduction of their reparations by one third, but refrained from submitting to the full Conference formal amendments to this effect. As Mr. Byrnes said after the Conference, "our views are different from the views of countries whose territories were laid waste by military operations and whose peoples were brought under the yoke of alien armies and alien gestapos." In the final vote, the Finnish and Hungarian reparation clauses were carried by simple majorities, with the United States against, and the four other Big Powers for.

In regard to Bulgarian reparations (which the Big Four had left open) Greece presented a claim for \$200 million while Yugoslavia proposed to ask Bulgaria only for a nominal sum of \$25 million (16 for herself, and 9 for Greece). Interestingly, the United States suggested that Yugoslavia should, on the basis of equality of burden of the ex-enemies, receive more than Yugoslavia herself asked, namely 50 million, with another 50 million going to Greece. When this proposal was rejected, the British motion to set the Bulgarian reparations to the two Balkan allies at \$62.5 million each, was carried with American support.

On the question of restitution of Allied property in the four countries, the compromise figure suggested by France—75 percent—was inserted in the treaties, by votes of 12 to 6, with 3 abstentions. A United States-British proposal that the ex-enemy countries must, during the 18 months following the signing of the treaties, grant the most-favored-nation treatment to all Allies (a clause to prevent Eastern-European tariff blocs) was also accepted with only a simple majority, as was the recommendation that citizens and corporations of all Allies must receive identical protection of property and economic initiative. However, rather unexpectedly, the British demand for special protection of foreign oil corporations in Rumania (which would have embarrassed Rumania in view of her socialization measures) was defeated by a vote of 10 in favor, 9 against, and 2 abstentions. The right of the Allies to seize, within their own territories, property of ex-enemy governments and citizens, was established only in the case of Rumania.

**Military Provisions.** The figures for the maximum strength to be allowed to Rumania, Hungary, Bulgaria, and Finland, respectively, were, after little discussion, set as follows: Army (in the case of Hungary, including Danube river flotilla personnel): 125,000; 65,000; 56,800; 34,400; navy personnel: 5,000; none; 3,500; 4,500; navy tonnage: 15,000; none; 7,250; 10,000; air force personnel: 8,000; 5,000; 5,200, 3,000; number of aircraft: 150; 90; 90; 90. All four countries were forbidden to possess bombers, and certain types of military equipment and of naval craft; only on the right of

Bulgaria to possess motor torpedo boats, no agreement was reached.

All Allied occupation troops (which, in these countries, meant Soviet troops) would withdraw within 90 days of the coming into force of the respective treaties.

**Conference Ends Its Work.** After having extensively discussed, and voted on, the 223 articles and 33 annexes of the 5 treaties, the Conference ended its work on time, on October 15. Three days later, in his radio report to the American people, Mr. Byrnes summed up his opinion: "In a world where no sovereign state can be compelled to sign or ratify a peace treaty . . . these treaties are not written as we would write them if we had a free hand. They are not written as other governments would write them if they had a free hand. But they are as good as we can hope to get by general agreement now or within any reasonable length of time." Mr. Bevin, reporting to Parliament, stated "I think we can say that the Conference has successfully accomplished" its task.

**The Final Work of the Council of Foreign Ministers.** In fact, when the Foreign Ministers of the Big Four started, on November 4, to write the final treaty texts on the basis of the recommendations of the Peace Conference, they found that the basic compromises which they had hammered out before the Conference, had passed the scrutiny of the other nations. This session of the Foreign Ministers was held at the Waldorf-Astoria Hotel in New York, concurrently with but independent of the meeting of the United Nations General Assembly. It was marked by an atmosphere of harmony. By December 12, it finished its work, having reached mutually satisfactory solutions for the issues which had troubled the Conference, mainly the governmental machinery for Trieste, the withdrawal of United States and British troops from Trieste, the Danube, and Bulgarian reparations; and decided that the formal signing of the five peace treaties would take place in Paris on February 10, 1947.

**Comparison of Two Peace Conferences.** How successful was the 1946 Paris Peace Conference? How does it compare with the Paris Peace Conference of 1919? To answer these questions, several important points must be taken into account:

(1) Every evaluation of the 1946 Conference, and comparison with that of 1919, must start from the fact that World War II was of different dimensions from World War I. Huge as had been the losses and sufferings, the hatreds and antagonisms caused by World War I, the effects of World War II are far worse. It is, therefore, very noteworthy that while the 1946 Conference was acutely aware of, and colored by, the tensions created by the war, it was not confronted with a controversy of true magnitude, e.g., during World War II various far-reaching reforms in the very structure of Europe were advocated, such as the creation of the United States of Europe, or of several regional federations, among them a Balkan federation. If, as is well conceivable, the Conference had had to revolve around such issues, really fundamental differences of opinion would have emerged. In fact, it can be said that it was the absence of fundamental decisions which made the discussion on details sometimes so heated, because the tensions were unloaded on comparatively minor items.

(2) Furthermore, the seriousness with which these problems, including matters of procedure, were debated, was due to three main factors: (a) As Mr. Bidault emphasized in his valedictory speech, it was the first peace conference at which

nations, large and small, from the four corners of the globe, deliberated in parliamentary fashion. This created many entirely new problems, and was responsible for a certain nervism, particularly in the early stages of the Conference. (b) In addition, the Conference was also the first ever held which was entirely public, even in its committee meetings. Qualified observers were inclined to think that the principle of publicity was carried too far, because mutual concessions are more difficult to reach in the limelight, and the public heard more about the inevitably tortuous road to agreements than about the agreements themselves. (c) All delegations felt that the principles and techniques used at the 1946 Conference, would set precedents for the even more important conferences on the German and Japanese peace treaties which were still to come.

(3) Some critics maintained that it was a mistake to deal with the "periphery" of Europe while leaving the central issue, Germany, in suspense. But, as the turbulent history of the postwar era of World War I showed, the regions which the Conference endeavored to normalize as quickly as possible, are far from "unimportant." In Eastern and South-Eastern Europe, during the aftermath of World War I, armed clashes occurred for years from Finland to Albania, including two full-fledged, sanguineous wars, the Polish-Russian war and the Turkish-Greek war. In view of these experiences, the Allied leaders were justified when they believed that, by normalizing that area (much larger than Germany) which stretches from the French border to the Black Sea, and from the Arctic to the shores of Africa, would not only contribute to the stabilization and economic recovery of these regions but of the whole of Europe and, indeed, the world. Also, as subsequent events have irrefutably proved, the relative speed with which the 1919 Versailles Treaty was signed, cannot be said to have been beneficial. It was in recognition of the failure of the methods used in 1919, that, this time, the Allies decided to treat Germany differently. In 1919, they intentionally abstained from occupying Germany, and quickly concluded peace with her; since that method did not prevent Germany from unleashing World War II, this time the victors decided to keep Germany occupied for a lengthy period, and to hand power back to a German government (which alone can sign a peace treaty) only if and when they would be reasonably sure of a stable democratic development in Germany. (For similar reasons, they delayed the drawing of a formal peace treaty with Japan, although a Japanese government to sign such treaty would already exist.) On the other hand, the Allies were agreed that no need for delay existed in the case of Germany's ex-satellites in Europe.

(4) While there were deep cleavages at the 21-nation Conference of 1946—which were magnified by the unique method of public parliamentary procedure—the going was much rougher in 1919, although there were, in essence, only 4 participants (France, Great Britain, Italy, United States) who negotiated privately. As has been said before, the 1919 Conference, different from the 1946 Conference, had to break up without, e.g. settling the Italo-Yugoslav frontier. Nothing similar to President Woodrow Wilson's leaving the 1919 Conference in disgust before it had ended, happened at the 1946 Conference.

(5) In fact, the United States in 1946 scored many more successes than in 1919; and it is altogether improbable that the United States will, this time, as it did after World War I, refuse to sign

the peace treaties and, thereby, weaken decisively the stability of the whole postwar structure.

(6) Equally important is the changed position of Russia. The Soviet Union was not invited to the 1919 peace negotiations, and like the United States never signed the treaties. At that time, the Soviet System, hardly two years old, was struggling for its existence; German troops were still entrenched in various parts of Russia; and the apprehension lest the revolution spring over into Germany, was one reason for hastening the peace treaty with Germany. The Western Allies quickly settled their relations with Germany, at the price of leaving unsettled, not only Germany's but their own relations with Russia. Thus, a significant element of insecurity was introduced into the world system.

If, in 1919, Russia's weakness was permitted to leave her outside, in 1946 it was Russia's strength which created new problems. But now there was general agreement that it would be not only impossible but, from the standpoint of world peace unwise to settle matters without her. At the 1946 Conference, the differences between the Western Powers and the Soviet Union were much in appearance, but, as Mr. Byrnes said in his radio report on the Conference, there were "many questions on which the Soviet Union and the United States voted together," although this wide area of agreement "attracted little public attention." In the end, and profiting from the results of the Conference, the Big Four were able to have the treaties for Germany's ex-allies ready almost as soon as the other Big Four had been after World War I, and to achieve this in a spirit of greater harmony than in 1919. The collaboration of countries with different ideologies complicated, of course, the writing of the treaties, but that sharing of responsibilities was as unavoidable, in view of the distribution of power, as it was indispensable for world peace and stability.

For all of these reasons, the 1946 Peace Conference was a significant step toward a new, more democratic type of diplomacy, and compares favorably with the Paris Peace Conference of 1919.

JOHN H. E. FRIED.

**PATENT OFFICE, United States.** Applications for the registration of trade-marks filed in the twelve months ended June 30, 1946, outnumbered those received by the Office in any equivalent period in its history. Their total was 26,216. Concurrently there were received 88,905 applications for patents the maximum since 1930. Of these 10,800 were for designs and 165 for new varieties of plants.

In consequence of this heavy increase in new applications and for want of additional personnel the issuance of patents was necessarily curtailed. There were granted only 27,587, the minimum in any fiscal period in forty years. There were included in this total 3,384 for designs and 115 for re-issues.

Further evidence of greater activity on the part of inventors, industrialists, and merchants was afforded by the widespread interest in the Public Register initiated in May 1945 to promote and facilitate the sale and licensing of patents. In the first twelve months of its operation there were listed in the Register upward of 11,000 patents, among them a considerable number owned by two large corporations. All patents recorded in the Register are published in the weekly *Gazette of the Office* and information concerning them is furnished directly to more than 2,000 manufacturers and to some 200 trade journals.

Receipts of the Office in the fiscal year reached

\$4,852,773.30, or \$724,651.30 in excess of those in 1945. Expenditures were \$5,914,470.04. This rise in expenses was due to the higher cost of discharging the many duties of the Office.

In the calendar year 1946 there were filed 27,739 applications for the registration of trademarks, including 6,658 for renewals. That total was the largest received in any twelve months. The number of applications for patents filed in the same period was 91,994, exceeding that received in any year since 1930. Of these, 10,720 were for designs.

CASPER W. OOMS.

**PERMANENT CHARITY FUND.** A Fund established in 1915 by the Boston Safe Deposit and Trust Company to furnish a medium through which money may be left in trust to charity. The principal of the Fund is invested and the income distributed to existing organizations, usually of Boston and vicinity. Payments to charities during the fiscal year ended June 30, 1946, totaled \$243,252 and capital assets on that date were \$6,006,627. President: Roger Preston. Secretary: Arthur G. Rotch. Offices: 100 Franklin Street, Boston 10, Massachusetts.

**PERMANENT JOINT BOARD ON DEFENSE—United States and Canada.** A Board set up by President Roosevelt and Prime Minister W. L. Mackenzie King in pursuance of a joint communiqué dated Aug. 17, 1940, to "commence immediately studies relating to sea, land, and air problems including personnel and material" and "consider in the broad sense the defense of the north half of the Western Hemisphere." Chairman: U.S. Section, Fiorello H. LaGuardia; Canadian Section, Gen. Andrew G. McNaughton.

**PERU.** A republic of South America. Area: 482,258 square miles (1940). Population: 7,395,687 (1943). Capital: Lima.

The country is divided from west to east into three natural regions: the coastal area along the Pacific Ocean; the sierra, or central highland; and the montaña, a region east of the Andes including piedmont slopes and lowlands. The climate of the west coast is cloudy and cool, that of the highlands varies from very wet during the rainy season between October and April, to very dry; the montaña is excessively rainy and generally hot and humid. Temperatures vary according to exposure and altitude.

**Population.** According to the census of 1940, 53 percent of the population of Peru is white and mestizo, and 46 percent Indian. Densities per square mile vary from 0.4 in the Department of Madre de Dios to 56.4 in the Department of Lima. The three largest cities are: Lima, 769,000, Callao, 95,601; and Arequipa, 85,369.

Spanish is the official language, but about half of the population speak Indian languages. The Roman Catholic religion is protected by the state.

The 1940 census showed 42 percent of the population to be literate; the highest proportion of literacy was reported from the coastal region, the lowest from the jungle area. In 1944 the five universities had a total student body of 8,500. In 1945 primary school enrollment totaled 717,162. Four national high schools, 27 normal schools, and 35 advanced training centers for teachers have recently been established.

**National Economy.** Peru's economy is principally agricultural and pastoral, but mining and manufacturing contribute substantially to the national income. Peru is the second largest producer of cotton in Latin America, the 1944 crop reaching 67,114 metric tons. In addition to cotton, sugar is an im-

portant export crop, while wheat, rice, corn, barley, oats, and potatoes are grown for home consumption. Production of sugar in 1944 totaled 444,000 short tons; of rice, 916,305 bags of 100 kilograms each. The livestock industry provides most of the local demand for meat. There were about 14 million sheep and 2.3 million cattle in Peru according to the 1941 livestock census. Wool (sheep, alpaca, llama, and vicuña) is an important export product; some hides and skins are also exported. The chief forest products are rubber and cinchona.

The petroleum industry is one of the most important factors in the economic structure of Peru; petroleum and its derivatives account for about 30 percent of the total mineral output of the country. In 1944 crude petroleum production totaled 14,385,926 barrels. Copper, gold, lead and silver are next in importance. Peru is among the four principal silver-producing countries of the world, although silver production has declined during the past ten years because of increased mining costs and the use of lower grade ores. Total production in 1944 was 492,444 kilograms. Copper production in recent years has been about 37,000 metric tons per year; in 1940, 44,000 metric tons were produced, in 1943 output was estimated at 36,572 metric tons. Peru produces about one-half of the world output of vanadium, as well as coal and zinc. The total value of mineral production in 1944 reached 390,000,000 soles.

Peruvian manufacturing has developed considerably since 1929. Local industries now supply a large part of the home market for many types of consumer goods. The cotton textile industry is one of the most important manufacturing enterprises; other leading manufactures include woolen and leather goods, cement, chemicals, tobacco, glass, paper, foodstuffs, pharmaceuticals, and beverages.

**Foreign Trade.** The value of Peru's foreign trade in 1945 amounted to nearly 1,224,415,904 soles, an increase of about 15 percent over 1944. Leading export items were: sugar, petroleum derivatives, copper, cotton, lead, mineral concentrates, wool, gold, flax, bismuth, elastic gums, silver articles, hides and skins, and fish. The United States took 34 percent of the total value of exports; Chile 19 percent; Bolivia 6; Great Britain 6.

Leading imports in 1945 were: wheat, machinery, rice, butter, wood, iron and steel, piping, jute bags, trucks and chassis, fertilizers, tires, rails, automobile parts, petroleum lubricating oils, and agricultural tools. The United States supplied 56 percent of the total value of Peruvian imports, Argentina 32, Chile 6, and Canada 5 percent.

**Government.** Peru is a centralized republic of 22 departments, under its Constitution of 1933. It has a bicameral Congress: a Senate of 49 members, and a Chamber of Deputies of 152. The Congress meets annually on July 28 for regular sessions of 120 days. The President is assisted by a Cabinet of 11 ministers, and is elected for a 6-year term. Dr. José Luis Bustamante y Rivero was elected President on July 10, 1945, and took office on July 28.

**Events, 1946.** Peru opened 1946 with a Cabinet shake-up that ended with the assignment of three ministries to members of the APRA (People's Party). The event marked the first time members of Peru's strongest leftist party were given responsibility in the Government. Previous to the Cabinet crisis, the APRA party members, under the leadership of Victor Raúl Haya de la Torre, preferred to remain in the political background and exert their strong influence in promoting the passage of desired legislative measures. When President Busta-

SOUTH AMERICA AND HEMISPHERE DEFENSE

Courtesy of The New York Times

mante realized that Aprista strength could not be denied, he assigned ministries—Treasury and Commerce, Agriculture, and Public Works—to *Apristas* leaders.

The revamped Cabinet included: Dr. Julio Ernesto Portugal, Prime Minister and Public Health; Dr. Luis E. Valcárcel, Education; Dr. Ismael Bielich, Justice and Labor; Engineer Enrique Gónzaga y Pareja, Aviation; Dr. Manuel Vásquez Díaz, Treasury and Commerce; Engineer Luis R. Vgarte, Agriculture; Engineer César Elías, Public Works; Gen. Manuel E. Rodríguez, Interior; Dr. Enrique García Sayan, Foreign Affairs; Col. Antonio Luna, War; Rear Admiral Enrique Labarthe, Navy.

By April the APRA party was recognized as the power behind the Government. After fifteen years of underground activities, the *Apristas* vigorously

prepared to push their program leading to nationalization of land and industry, rehabilitation of the Indians and the creation of a National Economic Council for raising the general standard of living. On April 13, *Apristas* dispersed an anti-Government demonstration in Lima and attacked the offices of the conservative newspapers *Cascabel*, *Hoguera*, *Vanguardia* and *La Prensa*. After police broke up the angry mob, Government Minister General Manuel Rodríguez dismissed Police Chief Jorge Dulanto for neglecting his duty by not controlling the riot.

In the supplementary Congressional elections held on July 2 the position of the APRA party was strengthened by the election of two *Aprista* Senators and eleven Deputies, which left the opposition only two seats in the Senate and four in the

Chamber of Deputies. With indisputable control of both houses of Congress, the *Apristas* launched a campaign to borrow money from the United States. The opposition to the plan, mostly among the cotton and sugar plantation owners, fought against the scheme for fear that the funds would be used for APRA's industrialization and irrigation program. By November 9 Congress approved a bill authorizing the Government to borrow up to \$30,000,000 from the United States Export-Import Bank.

A minor diplomatic strain resulted from a clash between United States Army and Peruvian Navy personnel at Talara on July 28 that ended with serious injury to a Peruvian ensign and the fatal injury of an American noncommissioned officer. The United States Embassy apologized and agreed to place the United States soldiers involved at the disposal of the Peruvian courts.

In late October the United States returned to Peru the Talara airbase, one of the key stations in the wartime Panama Canal defense system. The first commercial air agreement between Peru and the United States was negotiated on December 28, authorizing the United States airlines to operate within Peru and granted reciprocal rights to Peruvian airlines.

A series of earthquakes beginning on November 10 lasted for 48 hours in the region 200 miles north of Lima, causing the deaths of at least 700 persons and destroying several towns. United States Army personnel participated in the rescue work by parachuting into inaccessible regions isolated by the work of the earthquake. The towns of Conchucos and Sihuas were destroyed.

**PETROLEUM CONSERVATION DIVISION.** A Division of the U.S. Department of the Interior, established in 1936 to assist the Secretary of the Interior in administering the Connally law, which prohibits the shipment in interstate and foreign commerce of petroleum or its products produced in excess of the amount permitted by State law. By Executive Order 9732, dated June 3, 1946, the President designated the Oil and Gas Division, in place of the Petroleum Conservation Division to assist the Secretary in administering the above law.

**PHILANTHROPY.** The upward swing in American philanthropy, which has been in progress during the war years, was continued in the first postwar year, according to indications in the annual study made by The John Price Jones Corporation.

This study, which covers publicly announced gifts and bequests in eight large cities, shows that for the first eleven months of 1946 gifts and bequests in these cities totalled \$246,637,329 as compared with a total of \$209,306,297 for the full year of 1945. This eleven-month report indicates an increase of 17.84 percent over the 12 months of 1945, which showed an increase of 18.57 percent over 1944.

Publicly announced bequests for 1946 in the cities studied—New York, Baltimore, Boston, Chicago, Los Angeles, Philadelphia, St. Louis and Washington, D.C.—totalled \$24,694,552, compared with \$18,171,649 in 1945, a gain of 35.90 percent.

Gifts in the first 11 months of 1946 were \$221,942,777 as compared with \$191,134,648 in 1945, an increase of 16.12 percent.

American interest in war projects and foreign relief, in the first rehabilitation year, was evidenced by the fact that the largest totals of gifts were classified as follows: \$55,830,280 to foreign relief; \$33,043,895 to combined community funds and

war chests; \$32,398,660 to American war organizations such as the USO and Red Cross. Gifts in other classifications were as follows: \$35,129,923 to education; \$41,177,840 to organized social work; \$17,079,547 to health and \$5,266,025 to religious purposes.

New York led other cities in gifts during 1946. The total gifts for the cities studied were: New York \$119,359,476; Baltimore, \$12,215,185; Boston, \$20,940,967; Chicago, \$10,978,589; Los Angeles, \$15,299,902; Philadelphia, \$18,968,460; St. Louis, \$10,425,888 and Washington, D.C., \$13,754,310.

**PHILIPPINE ISLANDS.** A group of islands in the Western Pacific Ocean, ceded to the United States by Spain on April 11, 1899, conquered by Japanese armed forces in 1942, and liberated in February 1945. The Tydings-McDuffie Act of March 24, 1934, created the Philippines an autonomous commonwealth, and provided for them to become fully independent on July 4, 1946.

**Area.** The combined area is 115,600 square miles. This comprises 7,083 islands, of which only 466 cover as much as one square mile apiece. Two islands, Luzon (40,814 square miles) and Mindanao (36,906 square miles) account for more than two-thirds of the whole area. Others, with their respective areas in square miles, are Samar, 5,124; Negros, 4,903; Palawan, 4,500; Panay, 4,448; Mindoro, 3,794; Leyte, 2,799; Cebu, 1,695; Bohol, 1,534; and Masbate, 1,255.

**Population.** According to the latest estimates of the Bureau of the Census and Statistics, the 1946 population of the Philippines was approximately 18,846,800, as compared with 7,635,426 in 1903; 10,314,310 in 1918; and 16,000,303 in 1939. The Christian Filipinos of Malay extraction constitute over 95 per cent of the total population. Several pagan tribes of semi-civilized Malays inhabit the mountainous regions in Luzon. The Moros, who profess the Mohammedan religion, are concentrated chiefly in Mindanao and the Sulu Islands.

**Government.** The Government of the Commonwealth is republican in form, of the presidential unitary type, based on the principle of the separation of powers. The executive power is vested in a President, the legislative power in a Congress composed of the Senate and House of Representatives, and the judicial power in a Supreme Court and other inferior courts. At the head of the Government is the President, who is elected by direct vote of the qualified electors of the country for a term of four years. He exercises control of all executive departments, bureaus, or offices, including provincial and municipal governments; determines general policies; guides legislation; and, with the consent of the Commission on Appointments of the Congress, appoints the heads of the executive departments and bureaus, the members of the Supreme Court and judges of inferior courts, and ranking officers of the Philippine Army, of which he is the Commander-in-Chief. In case the President dies, resigns, or is removed or unable to serve, his powers devolve upon the Vice-President, who is also elected by the direct vote of the people. The legislative power is vested in the Congress of the Philippines composed of two chambers—the Senate with 24 members elected at large by the direct vote of the qualified voters and the House of Representatives with 98 members (not to exceed 120) elected from the 98 Congressional Districts into which the Philippines is presently divided. The Senators are elected for a term of six years, while the Representatives hold office for four years.

**Events, 1946.** The people of the Philippines entered the most significant year in their history in 1946 as they prepared to elect a President and Congress in April and accept their independence as a republic on July 4. With the approach of sovereignty, the islands found themselves burdened by the creations of a war—a disrupted economy, poor communications, insufficient food, a severe housing shortage, and an inflated currency. The most critical problem among the inhabitants of the 7,000 islands was a shortage in staple foods. Sugar production met only one-tenth of domestic requirements and rice production was crippled because work animals had been used as food by the Japanese.

In addition, the Filipinos awaited some revision in the Tydings-McDuffie Act of 1934, which provided for their independence as a free state, but also stipulated that they would lose most of their preferential trade status with respect to the United States, their best customer. Paul V. McNutt, High Commissioner for the Philippines, urged Congress to aid the Philippines in their rehabilitation by speedy enactment of the Bell Act which would guarantee Philippine-American free trade for eight years and then institute a gradually rising tariff scale. On February 12 Brig. Gen. Carlos P. Romulo, Resident Commissioner of the Philippines, requested \$100,000,000 in United Nations Relief and Rehabilitation Administration supplies and food to take care of about 1,500,000 Filipinos.

The two major candidates in the election campaign were the incumbent President, Sergio Osmeña, who succeeded to the Presidency after Manuel L. Quezon died on Aug. 1, 1944, and Manuel A. Roxas, President of the Philippine Senate. The Nacionalista party supported both candidates. Mr. Roxas attempted to evade an election based merely on a personality issue by campaigning under the banner of "liberalism." However, the leftist and liberal groups supported Mr. Osmeña as the election approached. Mr. Roxas, a highly controversial figure because of his ex-officio cabinet post in the puppet Philippine Government during the Japanese occupation, gained the support of the more conservative elements among the voters. His claims to leadership of the wartime resistance movement were supported by Gen. Douglas A. MacArthur.

On April 23, three million eligible voters, of the 17,000,000 population, elected Manuel A. Roxas President and Senator Elpidio Quirino Vice-President.

The critical condition of Philippine economy brought assistance from the United States in the form of the Philippine Trade Act and the Philippine Rehabilitation Act, which were passed by the United States Congress on April 30. The Philippine Trade Act, also known as the Bell Act, was accepted by the Philippine state on July 3. The Trade Act provided for free trade between the two countries for eight years, after which incoming Philippine products are to be taxed at the rate of 5 per cent, with an additional 5 per cent each succeeding year, over a span of twenty years. At the end of the prescribed period Philippine products will be assessed full duties. The Rehabilitation Act provided for the granting to Philippine war damage claimants of \$400,000,000 in war damages, the disposal without reimbursement of \$100,000,000 in surplus property and the spending of \$120,000,000 in various rehabilitation and training projects.

President-elect Roxas announced his firm intention of strengthening relations with the United States and encouraging United States participation in Philippine economic life. In an interview on May

11 he extended an invitation to United States capital, predicting that his nation would need financial aid for five years. Shortly afterwards he guaranteed to the United States the continued existence of army, navy and air bases on Philippine territory and promised full cooperation in all defense and security measures.

Formal proclamation of the election of Manuel A. Roxas as President was delayed in the Philippines Senate on May 25 when minority members walked out after a dispute over the number of votes needed to organize the upper chamber. In the prewar Senate, sixteen members were required for a quorum. The Roxas Senators claimed the old rules were not valid; the minority contended they still applied. Underlying the argument caused by a lack of rules procedure was a further rift which arose when minority leader Tomas Confessor challenged the seating of three Roxas Senators on the grounds that they were under indictment on charges of collaborating with the Japanese. Despite the walkout twelve majority Senators on the following day proclaimed the election of Manuel A. Roxas and approved a resolution barring three Senate supporters of outgoing President Osmeña from taking oath of office.

President-elect Roxas took his oath of office on May 28 and appointed the following Cabinet:

Finance—Elpidio Quirino  
Interior—José Zulueta  
Justice—Judge Roman Ozaeta  
Agriculture and Commerce—Mariano Garchitorena  
Public Works—Ricardo Nepomuceno  
Public Instruction—Manuel Gallego  
Health and Welfare—Dr. Antonio Villarama  
Labor—Pedro Magalán  
National Defense—Ruperto Kangleon  
Chief of Executive Office—Emilio Abello

In submitting his 1946-1947 budget to the new Congress on June 8, President Roxas estimated that the Philippine Republic would be almost 248,000,000 pesos (\$124,000,000) in debt at the end of the first year's operation in July, 1947. He put total resources down to less than 6,000,000 pesos and predicted an unbalanced budget for at least five years with a major portion of the income depending on requested loans from the United States. Previous to his election victory, President Roxas visited Washington and requested a \$400,000,000 loan in five yearly installments from the United States Government and an additional loan of \$250,000,000 for self-liquidating reconstruction projects from the Export-Import Bank.

The Republic of the Philippines was born on July 4 to the accompaniment of a pledge from President Truman that the United States "will continue to assist the Philippines in every possible way." In Manila, President Roxas was formally inaugurated as the first President of the Republic in the presence of Gen. Douglas A. MacArthur, Supreme Allied commander in the Far East, and Paul V. McNutt, who had been nominated Ambassador to the islands by President Truman on June 14.

Attempts to repair the disabled economy were hampered by continued military activities forced by the presence of wandering bands of die-hard Japanese units among the Islands and serious civil unrest in central Luzon, where the Hukbalahaps refused to recognize the Roxas Government. The mopping up of an estimated 4,000 Japanese was conducted by Philippine troops, armed with United States weapons and commanded by United States Army officers.

The Hukbalahaps, who entrenched themselves in the rice-growing plains of Luzon, comprised about 150,000 ex-guerrillas who had waged fierce

warfare against the Japanese. After the defeat of Japan, they turned their fight against the absentee proprietors of the land and set up their own civil, military, and administrative procedures. Reporters from the American-owned *The Manila Daily Bulletin* made first-hand investigations and described the Hukbalahaps as an organization predicated upon pattern of communism. They set up their own courts, levied taxes, maintained their own marriage and divorce ceremonies, divided crops, and conscripted men for their armed forces.

The promise by the newly-installed Roxas Government of the swift surrender of 11,000 "Huks" on June 1 never materialized as intermittent fighting continued. José de León, a powerful chief of the dissidents agreed to cooperate with the pacification program if the Government first would seat the seven Congressmen of the Democratic Alliance (the political party of the Hukbalahaps), including the Hukbalahap supreme leader Luis Tarac, by declaring the April elections in central Luzon valid and then recognizing the Hukbalahap guerrillas for veterans' benefits. During the Summer, Tarac conferred with Government officials over the "Huk" demands, which were based on agrarian reforms. Claiming that they represented the tenant farmers, who for years had suffered under a fifty-fifty crop split with the landlords and had to pay all their own expenses, the "Huk" leaders demanded a sixty-forty crop split, with expenses shared equally by tenant and landlord.

President Roxas declared he would not "trade concessions for observance of law" and set an August 31 deadline for the relinquishment to the Government of all illegally held arms. On September 2 the Government began wholesale arrests of peasant leaders and used artillery against insurgent bands operating in the mountains sixty miles north of Manila.

President Roxas quickly moved to present a stalemate in the Judiciary Department on July 10 when the Congressional Committee on Appointments refused to confirm some 800 judicial appointees named during the Osmeña administration. The Committee members held that subject judges, prosecutors, peace justices, and minor officials had been appointed in temporary capacity, which was unconstitutional. Function of the judicial system immediately stopped and pending cases were suspended. On the same day President Roxas appointed 117 new and old judges, covering key positions vacated by the Committee's actions, then called the Committee into a special session to consider the appointments.

During the spring the United States Congress passed a bill approving a \$75,000,000 loan to the Philippines to meet the budgetary requirements of the new Republic. The bill in its original form provided for a \$100,000,000 loan, which was supported by Ambassador McNutt. However, the House Banking Committee acted on the advice of U.S. Treasury Secretary John W. Snyder and William N. Clayton, Assistant Secretary of State.

The Transfer to the Philippine Republic of "practically all United States surplus property now in the Islands" was announced by both governments on September 11. The sale was made at 21.4 percent of the original procurement value of \$630,000,000. Neither military equipment nor aircraft were included in the transfer.

The Philippine Trade Act contained a proviso that raised a flurry of controversy in the new Republic's Congress. Validity of the Act depended upon the Philippine's granting United States nationals equal rights with Filipinos in the develop-

ment of the country's national resources. Conflict with this stipulation arose in the provisions of the Philippine Constitution which stated that all corporations dealing with resources and utilities must have at least 60 per cent Filipino membership and capital. After vigorous opposition by part of the Nacionalista Congressmen on the grounds of "imperialist exploitation," both houses of Congress on September 15 approved a national plebiscite for a constitutional amendment complying with the Philippine Trade Act.

During a special session of Congress on September 25, President Roxas proposed a reconstruction plan aimed to hasten the agricultural and industrial development of the Philippines and make his country less dependent on the United States. He asked Congress for authority to create a Rehabilitation Finance Corporation, patterned after the American Reconstruction Finance Corporation. Capitalized at about \$150,000,000, the corporation would be empowered to grant loans to private individuals or corporations for the rehabilitation or development of agricultural, commercial, or industrial enterprises; to make loans to Government corporations for self-liquidating projects, including waterpower development, public utilities, irrigation systems, water works, resettlement projects and purchase and subdivision for sale of landed estates, to make loans to cities, towns and provinces for self-liquidating projects, to underwrite agricultural marketing and consumers' cooperatives and to grant home-building loans to individuals.

A war profits tax bill, imposing a graduated tax of 60 to 99 per cent on business profits in excess of 6,000 pesos from the beginning of the war to liberation, was signed by the President on Oct. 15.

During the term of the Japanese occupation, many prominent government officials and civic leaders were coerced or induced into joining the puppet regime sponsored by the Japanese. In early August charges of collaboration were filed in the People's Court against the former puppet President, José Laurel. Pleading for his release on bail, Laurel said that by October, 1942, "all Filipinos were collaborators," forced into submission by Japanese acts of duress, coercion and inhuman massacre. He brought the court's attention to the fact that President Roxas had served in the same puppet government. Since the United States was unable to defend the islands, he argued, it was necessary for Filipino officials to serve the Japanese in order to minimize the suffering of the whole people.

After his release from prison on bail, Laurel engaged in vehement denunciation of the proposed constitutional amendment to grant United States "parity rights" in the Philippines.

As the Philippines progressed from commonwealth status to a republic, relations between the Filipinos and the United States occupation forces became strained. General MacArthur attributed the ill-feeling to an "understandable feeling of nationalism on the part of the Filipinos." By October anti-American sentiment had reached a new high. In his report to United States Chief of Staff, General Dwight D. Eisenhower, General MacArthur placed responsibility on the low morale of raw recruits and resentment of Philippine nationals towards the presence of foreign troops. Added factors included the rise in criminal cases among the soldiers, the overcharging on purchases made by U.S. troops, and resentment over continued Army "squattling" on private property. On October 10 President Roxas claimed that some United States soldiers had engaged in spreading Communist propaganda in the Philippines.

The War Department took action on November 2 to remedy the condition by tightening discipline and improving the indoctrination of replacement troops, who would be, in the future, volunteers rather than draftees.

In early November Manila's city laborers began a strike—originally stimulated by a reduction in living allowances—that developed into a major issue concerning labor's right to strike against the Government. The workers, employed in the essential services of garbage collection, street cleaning, and burial of the dead had been receiving a supplemental allowance of five to ten pesos daily to protect them against inflationary living costs. President Roxas interpreted the strike as a seditious movement and ordered the arrest of any men found picketing. By picketing, which was viewed as intimidation, the unions violated a Philippine law which held that preventing "the national Government or any municipal or provincial Government or officer thereof from freely exercising its or his functions or preventing the execution of any administrative order" would be construed as inciting to sedition.

The effectiveness of the strike was greatly reduced in mid-November by Manila's Mayor V. Fugoso, who used other Government workers to perform essential city functions. The local Congress of Industrial Organizations, the Philippine counterpart to the American CIO, still maintained the strike, but its effectiveness was actually broken by police-protected workers who replaced the strikers.

The projected national plebiscite, scheduled for March 11, 1947, for amending the Constitution to provide certain rights for Americans, received the support of President Roxas on November 19. Speaking before the student body of the University of the Philippines, the President predicted wide economic disaster if the proposed amendment were rejected. Most of the objection to the amendment was based on the term "equal rights," which the President called a misnomer. American citizens would not be granted equal rights, he said, but only special rights with regard to the development of natural resources and ownership of public utilities. If the amendment were ratified, engineers, miners, and technicians would be granted special rights to the benefit of the Philippines, he said, since these skills were much needed.

The several months' negotiations concerning United States military bases in the Philippines approached their final stages as the year closed. On November 30, President Roxas announced that agreement had been reached permitting the United States to establish bases on the Islands for mutual defense. While the basic principle of mutual defense was accepted, the details concerning the size, location, and character of the bases remained under discussion, with indications that the Philippines Government objected to many aspects of the United States Army and Navy desires.

The Philippines' road system, which had suffered severe destruction during the war, received aid on December 12 from the United States Public Roads Administration in the form of \$9,960,000 allocation for highway construction. The Philippine Government was requested to provide an equal sum for 1947 construction. The allocation started a \$100,000,000, four-year program of road construction which was part of a more extensive rehabilitation plan to improve ports and harbors, schools, hospitals, air transport, the fishing industry and public health. Also included in the program was a broad personal training program for Filipinos.

The first advance payment by the United States for war damage to public property in the Philippines was made on December 16 by Dr. Frank A. Waring, chairman of the War Damage Commission. The installment of \$1,000,000, part of the \$820,000,000 eventually to be paid, depending on the outcome of the plebiscite on the Constitutional amendment, was handed to President Roxas, after Dr. Waring explained the Commission's operations to a conference of provincial governors. Ten offices would be established throughout the Islands to process personal claims, which the Rehabilitation Act limited to \$500 each. Originally, about 1,000,000 claimants had been anticipated, but later developments indicated that the Commission might expect more than 3,000,000 personal claims.

On December 21, President Truman announced that the Philippine Congress had accepted the July 4 trade pact with the United States, providing for eight years of free trade between the two countries.

**Economy.** Philippine exports consist principally of raw materials and semi-manufactured products, while the imports are mainly manufactured or semi-manufactured goods. The Islands sell raw sugar, copra, abaca, tobacco, gold and other metallic and nonmetallic minerals, lumber, and such processed or manufactured goods as coconut oil, copra, cigars, rope, embroideries, fiber hats, cabinet woods, rattan manufactures, pearl buttons, guns, and resins. In exchange for these products the Philippines receives a variety of manufactured articles, including iron and steel products; chemicals, drugs, and dyes; automobiles, trucks, and parts; cotton and manufactures; silk and rayon; meat and milk products; vegetables, fibers, and products; paper and paper products; fertilizers; tobacco products; machinery of all kinds; leather and its products; flour; rubber products; oil products; fruits and nuts.

With the total dislocation of Philippine export industries the immediate resumption of the export trade of the Philippines cannot be expected. Almost all of the major industries as well as the minor ones have been paralyzed, and experts believe that they cannot attain prewar levels of production until after four years of rehabilitation, assuming that rehabilitation materials will be forthcoming at an early date. Two major industries—copra and hemp—have made initial production but in quantities far below even the requirements of the United States Army alone. Through the encouragement of the U.S. Commercial (CEMCO) and the Philippine Abaca Management Company (PAMCO), production and shipments of abaca and copra are expected to gain headway in the coming months.

The export in 1945 of copra, which was evidently produced in minor copra-producing regions, was about 9,000 tons, of which 400 tons were shipped in September, 1945. The total value of copra exported is not definitely known, but it is estimated that the aggregate may amount to approximately 1,000,000 pesos.

JOSEPH P. BLANK.

**PHOTOGRAPHIC PROGRESS.** In the first peacetime year following the second world war, it is an ironic commentary on mankind that the most photographed event was the atomic bomb tests in Bikini Lagoon in the Pacific. These tests, known as "Operation Crossroads," were recorded by more than 500 cameras, ranging from 16-mm and 35-mm motion picture cameras, to press cameras, aerial cameras of many sizes, and telephoto cameras with lenses as great as 48-inch,—all trained on one area in the lagoon to record the first explosion over and

under water of this terribly destructive bomb. More than 100,000 still pictures and 3 million feet of film were exposed during the tests on July 1 and 25, not including the many thousands of pictures taken by the press and newsreel cameramen. Batteries of cameras were installed on high steel towers around the lagoon, in airplanes such as C-54s, F-13s, PBMs, and TBMs, on destroyers and target ships. Four B-17 "drone" airplanes were also equipped with cameras. Many of the cameras were operated by electronic controls from remote stations. Specially-trained underwater cameramen photographed the underwater damage to the ships. Panchromatic, infrared and color films were used as well as films specially sensitized to different parts of the spectrum. An ultra speed streak camera photographed the explosion during the first few milli-seconds and batteries of high speed cameras loaded with color films made complete records of the tests. Many weeks of rehearsal were necessary in order to insure the smooth working of all of the camera crews when the zero "second" arrived. Interpretation of the photo-records was expected to reveal much useful data on the characteristics of this powerful bomb. (*U.S. Camera* 9: 21, September 1946; also *Internat. Phot.* 18: 5, September 1946; *Amer. Cinemat.* 27: 352, October 1946).

During the year the United States Army released more information on the types of cameras used to photograph radar screens, and it was predicted that such equipment would find many applications in the extensive use to be made of radar apparatus. The cameras were designed as a part of a chamber fitting over the radar screen and in some cases included a viewing device, where the operator could observe the screen as he photographed it. On January 22, a radar signal echo from the moon was recorded photographically by the U.S. Army Signal Corps. Striking radar pictures of an approaching hurricane were released by the U.S. Navy.

Scientific exploration of the upper air was carried on with the aid of special cameras installed in rockets. Previously such tests were conducted from free and from controlled balloons. The highest altitude from which a good photograph of the earth had been taken was 72,395 feet, which was attained by the balloon, Explorer II, on November 11, 1935. Several V-2 type rockets were launched from the U.S. Army base at White Sands, New Mexico. One of these reached a record speed of 3,600 miles an hour and sped 102 miles from the earth. Eight gun-type 16-mm cameras were installed in the rocket, of which six, were loaded with black-and-white, and two, with color film. Five of the eight cameras were recovered and the film records from an altitude of 40 miles were "reproducible" but those from 100 miles were blurred by vibration. The photographs were made at rates of 16, 32, and 64 pictures per second with lens openings ranging from f/8 to f/16. In future tests, high speed shutters will be used in hopes that clear pictures will be obtained at 100 miles or higher above the earth's surface (*Rochester Democrat and Chronicle*, October 20, 1946). A special spectrograph, built by Bausch and Lomb Optical Company, was installed in a rocket that was fired on October 10. The photographic record showed forty spectrograms of the sun at various altitudes up to 65 miles. Above this height, rotation of the rocket turned the spectrograph away from the sun (*Rochester Times-Union*, October 30, 1946). The first night test was made on December 17, when a rocket ascended to the record height of 114 miles. Good photographs were made of the

exhaust flames and incandescent fins of the rocket. These and other photographic studies were expected to add much valuable data to man's knowledge of the upper air.

Thomas and Coles published data on the various types of specialized photography as applied to engineering problems of the U.S. Army Air Forces (*J. Soc. Mot. Pict. Eng.* 46: 220, March 1946). Brief details of initial tests of the first photographic equipment to be installed in a jet airplane, the XFP-80A, were released. Improved quality in aerial photographs, from altitudes as high as 35,000 feet, was reported and the installation was said to have quick interchangeability (*Amer. Cinemat.* 27: 186, May 1946).

**Color Photography.** Public interest in processes of color photography appeared to be growing rapidly, and it was satisfied in part by an increase in the quantity of color films and printing materials available over the previous year. Great interest was shown by professional and amateur alike in the new color sheet film called Ektachrome, that was exhibited in August at the Chicago convention of the Photographers Association of America. This product represented an adaptation of Kodacolor Aero Reversal film that was introduced in 1940 and used throughout the war by the armed forces. The new film is especially applicable to commercial, illustrative photography. It is a color monopack that can be reversal developed by the user to produce a positive color transparency. Dye-forming couplers are dispersed during manufacture in the three emulsion layers. Total processing time is 90 minutes (*Internat. Phot.* 18: 18 September 1946). For color prints from Ektachrome and other color transparencies, the Eastman Kodak Company recommended their Dye Transfer Process which was announced in 1945. This process uses a tanning developer, a special set of dyes for rapid transfer, mordanted paper, and a simple device to insure accurate registration of the three transferred dye images.

In March, Ansco Color roll film was placed on the market by the Ansco Division of the General Aniline and Film Corporation. Other color products of this firm included a sheet film, 16-mm motion picture film, 35-mm miniature camera film, and a printing material known as Printon. This last-named product was used by several color printing laboratories for making amateur color prints. Robins and Varden described semi-automatic developing and printing machines used by one of these printing laboratories, Pavelle, Inc., New York (*Electronics* 19: 110, June 1946).

At the annual convention of the Photographic Society of America held October 30 to November 2 in Rochester, New York, Hanson and Vittum described a new chemical invention in color photography, the use of colored couplers in a negative color film. To avoid a degradation in quality in the final print resulting from unwanted absorption in the color negative of blue and green light by the cyan dye, and of blue by the magenta dye, they worked out colored couplers which absorb the unwanted blue and green. When the color negative is processed, the image consists of a negative of the normal dyes and a positive of color couplers remaining in the film. When a print is made from this dual image, all the colors were said to have better saturation and hue, and the brightness of the blues, yellows, and reds was improved over that of similar prints made from color negatives without colored couplers.

Aerial photography in color was reported to have the advantage over ordinary photography of

providing greater depth perception. Desirable beach landings in Okinawa were appraised accurately from inspection of aerial color pictures of the island (*Sat. Eve. Post* 218: 26, May 18, 1946). Continuous-strip stereo color pictures of the bomb damage to Japanese cities were projected by the U.S. Army Air Force on the opening night of the exhibition of the Photographic Society of America on October 31, in Rochester, New York. The pictures were on Kodachrome Aero Reversal film and had been exposed during the summer of 1946 under the supervision of Colonel George Goddard by order of General Carl Spaatz. A special twin-lens polaroid projector enlarged the seven-inch wide film onto a screen, about 10 by 15 feet in size. Viewed with polaroid spectacles, the resultant pictures gave an impression much like a flight over the area in a glass-bottomed airplane. Kistler described the operation of this camera, its use during wartime, and possible applications (*Photogrammetric Engineering* 12: 219, June 1946).

Additional details were published during the year, in the United States and in England, of the reports of military investigators in Germany, who studied the production and processing methods used for the Agfacolor negative and positive film and color paper. (*Report No. 339*, Publication Board of the War and Navy Departments of the United States; also *Photo. Trade Bull.* 7: 451, July 1946; *Brit. J. Phot.* 93: 263, July 26, 1946).

Dufaycolor, which is one of the few remaining additive color processes that is used commercially, was said to have been improved during the war period. A finer ruling of the screen réseau was reported to give better color rendering (*Brit. J. Phot.* 93: 119, April 5, 1946).

Parallel with the growing interest in color processes was the expansion of the reproduction of color photographs in the photo-magazines, such as *Saturday Evening Post*, *Life*, *Coronet*, *Look*, and *National Geographic*. Many of the earlier engraving problems had been overcome and the quality of the reproductions was generally improved. Spot news color pictures occasionally were being used in metropolitan daily papers. The Chicago Tribune had an entire page of color photos of the Easter parade on the press thirteen hours after the unprocessed films were received (*U.S. Camera* 9: 47, July 1946). A color picture of the Shrine parade in San Francisco was said to have been printed in color within ninety minutes after the negatives were received (*Popular Phot.* 19: 154, November 1946). Outstanding color pictures reproduced in *Life* magazine during the year included a remarkable series of forty-eight photos of war surgery in the issue of February 11; the Consistory for the Cardinals in Rome shown in the issue of February 18; and the chemical analysis of Plutonium and Neptunium in the issue of July 8. Stroboscopic high speed flash color was also used to a limited extent for illustration, press, and advertising purposes (*Internat. Phot.* 18: 10, July 1946). An example which appeared on the cover of *Look* for June 25 showed a prize fighter landing a knockout punch. Details of masking Kodachrome transparencies for reproduction were described in the *Graphic Arts Bulletin* (No. 8—1946).

In the professional color motion picture field, Technicolor was still used for the majority of feature pictures and shorts although several production releases were made by two-color subtractive processes such as Cinecolor, Magnacolor, and Trucolor. In June it was reported that Republic Pictures were planning sixteen feature pictures by their Trucolor process (*Mot. Pict. Herald* 163: 21,

June 22, 1946). Special filter techniques to give improved color rendering in Technicolor were described by Rennahan who also said that it required a crew of five persons to handle and operate the 700-pound Technicolor camera (*Amer. Cinemat.* 27: 356, October 1946). For some of their pictures, Technicolor used 16-mm Kodachrome and 35-mm monopack films.

Fernstrom described the Rotocolor system for producing motion pictures by means of a special camera and optical printer. In the camera, 16-mm Kodachrome film (perforated on one edge) moves horizontally past the aperture and the resulting picture image is almost as large as that obtained in a 35-mm camera. The film is printed in optical printers which enlarge the images slightly from those on the 16-mm film; thus 720 feet of 16-mm pictures make up 900-feet of 35-mm pictures (*Internat. Phot.* 17: 11, January 1946).

Two interesting surveys on color photography were published: one dealt with current processes of color cinematography in England (*Amer. Cinemat.* 27: 164, May 1946); and the other covered a hundred years of color (*Phot. J.* 86A: 187, August 1946). British patents of 1941–1946 in color photography were classified and reviewed (*Brit. J. Phot.* 93: 164 et seq. May 10, 1946).

**Motion Pictures.** At the conclusion of their war-work schedule in the fall of 1945, the motion picture studios resumed their peacetime task of providing entertainment for the box-office patrons who each week average about 85 million paid admissions in the United States. Production of pictures was also growing in Mexico and several countries in South America. Studios in England and France began to resume production. It was also learned by military investigators that the German studios had been able to maintain a fair production schedule during most of the war and had made several feature pictures by the Agfacolor process.

The fiftieth anniversary of the first showing of motion pictures in a theater, Koster and Bial's Music Hall, New York, was celebrated appropriately on April 23. Although the Music Hall had been torn down years ago, Thomas Armat, the inventor of the motion picture projector, was living quietly at his home in Rock Creek Park in Washington, D.C. The projector he used for that première showing embodied certain basic features, such as a loop-forming means, and an intermittent movement that gave relatively longer periods of rest and illumination than the time needed for movement from picture to picture. Another significant anniversary was the twentieth for sound pictures since they were first introduced successfully as a major feature of a theater program. On August 6, 1926, the Warner Brothers' production, *Don Juan*, with musical background, was shown at the Warner Theater in New York. Illuminated scrolls were presented to Armat and Warner Brothers in May 1946 by the Society of Motion Picture Engineers. In October, scrolls were also presented by this Society to the following firms who had made major contributions to the development of the sound motion picture: Bell Telephone Laboratories, Inc.; Radio Corporation of America; General Electric Company; Westinghouse Electric and Manufacturing Company; Twentieth Century-Fox Film Corporation; Western Electric Company, Inc.; Metro-Goldwyn-Mayer Studios. A scroll was also presented to Lee DeForest in recognition of his original researches which resulted in the invention of the three-electrode vacuum tube.

The year also marked the twenty-fifth anniversary of the world's best known group of camera-

men, the American Society of Cinematographers. Historical articles on the development of sound motion pictures were published by Watkins (*Bell Lab. Record* 24: 289, August 1946) and by Levinson (*Scientific Monthly* 63: 101 et seq, August 1946).

At the semi-annual meeting of the Society of Motion Picture Engineers in New York in May, and in Hollywood in October, technical progress in motion pictures was discussed under various headings, such as apparatus, color, film processing, lighting problems, projection, standardization, sound recording and reproduction, and television. In England, technical progress was reported in the *Journal of the British Kinematographic Society*. Past and future activities of the American Society were summarized in a paper by Hyndman and Maurer, before a joint meeting of the British Society and the Royal Photographic Society held in London on April 10 (*J. Soc. Mot. Pict. Eng.* 47: 212, September 1946).

Ever since the introduction of sound into the motion picture in 1926, there has been an increasing demand for trained technicians by the motion picture industry. This demand was met in part by the introduction of special courses by colleges throughout the United States. Information on the types of courses being taught was compiled in outline form and published by Frayne (*J. Soc. Mot. Pict. Eng.* 47: 95, August 1946). Another interesting report dealt with the activities of the U.S. Army Pictorial Service throughout the war (*Business Screen* 7: 1-98, January 1946). Brooker discussed the plan and experience that went into the 457 industrial training films which were made by the United States Office of Education, 1941-1945 (*Business Screen* 7: 19, April 1946).

The use of 16-mm film for professional motion pictures appeared to be growing. Several well-known producing companies in Hollywood announced their plans for releasing feature pictures on 16-mm film for showing in the smaller towns abroad. One theater in Hollywood, California, and one in Keansburg, New Jersey, set up programs for showing 16-mm pictures (*Mot. Pict. Herald* 162: 16, March 23, 1946). Industrial applications of 16-mm movies were expanding.

**Applied and Scientific Photography.** Motion pictures of the plays during the first half of the conference football games of the University of Southern California were to be shown to the squad between halves of each game. A portable, automatic film-processing machine like those developed for army use in the field permitted the film to be processed ready for projection in 10 minutes (*Home Movies* 13: 618, October 1946). An indication of the important role that photography plays in modern industry was shown by the report of its use in the design and manufacture of a new four-man plane, the *Navlon*. Five hundred negatives and 25,000 prints were made for the initial experimental production stage, phototemplates were used for all pattern parts, all stages of construction were recorded by straight photography as well as by special cameras such as photomicrographs and high speed motion pictures and finally, during test flights, movies and stills were made on panchromatic and on color films (*U.S. Camera* 9: 25, July 1946).

Schoenfelder reported that Vectographs (third-dimensional photographs) were used by the U.S. Army Quartermaster Corps as a means of evaluating the quality characteristics of textiles. It was found possible to use the Vectographs in place of cloth samples to show defects in the cloth (*Indus-*

*trial Standardization* 17: 255, October 1946). The distribution of the radiant heat in pipes installed in the floors and ceilings of rooms was shown clearly by photographing the totally darkened room on infrared-sensitive film (*Life* 20: 77, January 21, 1946).

Photography was reported as serving a very useful purpose in the occupational therapy program at the Walter Reed General Hospital where both ambulatory and non-ambulatory patients were able to use it. For the latter group, a traveling studio, 4 by 6 feet in size, was equipped for all phases of photography, including taking, processing, printing, and exhibiting (*Popular Photog.* 18: 57, March 1946). To help its amputees to learn to walk with artificial legs, the U.S. Army arranged to have repetitive-flash pictures taken of the movements of natural and of artificial legs. Over 800 such studies were made by Mili who found that differences were most clearly shown when his subjects carried tiny electric-light bulbs on their hip, knee, and ankle which produced light-traces of the leg movements (*Life* 21: 91, July 1, 1946).

Edgerton presented data on the fundamental optical and electrical characteristics of electrical flashtubes. Such light sources have been found in recent years to be especially useful for photography and for light measurements (*J. Opt. Soc. Amer.* 36: 390, July 1946). Flashtubes were used by Edgerton and coworkers to study the movements of "flying fish" in the Pacific off Catalina Island. The resulting photographs taken at 1/10,000 second revealed that the fish do not fly but rather glide somewhat in the same way as the "flying squirrel" (*Travel and Camera* 1: 73, August, 1946).

The contrast of microscopic photographic images was increased by depositing obliquely a thin metallic film on the microscope preparation (*J. Applied Physics* 17: 23, January 1946). Improvement of resolution in electron diffraction cameras was discussed by Hillier and Baker (*ibid* 17: 12, January 1946).

The roles of detonation waves and autoignition in spark-ignition engine knock were discussed by Miller who showed pictures made at rates of 40,000 and 200,000 per second (*Soc. of Automotive Eng. Preprint*-1946; also *New York Times*, October 15, 1946, Sect. C, p. 29). Shadows of shock waves in water were photographed by McMillan and Harvey by means of a point-spark of less than 0.1 microsecond. Striations frequently appeared in the shadowgrams when the waves were reflected (*J. Applied Physics* 17: 541, July 1946).

Specifications for aerial photographs used in forestry surveys were published by Spurr and Brown, who reported that infrared film used with a Wratten No. 12 (minus blue) filter gave the best results (*Photogrammetric Engineering* 12: 131, June 1946).

**Physical Measurement and Standardization.** A detailed classification of the various types of construction used in photographic lenses was published by Kingslake. The classification is based on the number of components in the lens and a simple drawing is included of each objective with an accompanying reference (*J. Opt. Soc. Amer.* 36: 251, May 1946). Daily described a method for the calibration of the effective *f*/stop value of a camera lens in terms of the light transmitted by the lens. The lens is centered over the open port of an integrating sphere and the light output from the sphere is measured. A calibration curve is then obtained for the equipment wherein metal plates with holes of known diameters are placed over the

opening of the sphere in place of the lens. The effective aperture is defined as the size of opening which will pass the same total amount of light as the lens under calibration (*J. Soc. Mot. Pict. Eng.* 46: 343, May 1946).

Improvement of photographic color rendering by correction filters was calculated by van Kreveld by means of the addition law. He showed that each filter can be characterized by three "improvement factors," which are nearly independent of the color sensitivity of the emulsion (*J. Opt. Soc. Amer.* 36: 412, July 1946).

Jones and Higgins reported further progress in their investigation of photographic granularity and graininess. In their second paper they discussed the effects of variations in instrumental and analytical techniques. With the photographic materials used, no scanning aperture was found which gave granularity-versus-density functions similar in shape to the graininess-density function. Some preliminary data were included on certain visual aspects of the general problem (*J. Opt. Soc. Amer.* 36: 203, April 1946).

Some techniques were described by Goldstein and Bales for the periodic recording of single, fast traces on a cathode-ray tube at rates up to 4,000 per second. Factors affecting the maximum writing speed were discussed and it was shown that speeds as high as 70 cm per microsecond can be obtained without sacrificing deflection sensitivity and using commercially available tubes and films (*Rev. Scientific Instruments* 17: 89, March 1946). Simons published details on a continuous film- or paper-recording camera for use with standard cathode-ray oscilloscopes enabling components up to 5,000 cycles per second to be analyzed (*Electronic Engineering* 18: 10, January 1946).

A review was published by McNair of the development of photographic standards by the Still Photography Committee Z38, the Motion Picture Committee Z22, and the War Committee on Photography and Motion Pictures, Z52, of the American Standards Association. It is shown that a substantial background now exists of standards for those concerned with equipment and practices in these fields (*J. Phot. Soc. Amer.* 12: 283, June 1946). A complete list of twenty standards in the field of motion pictures was printed in April (*J. Soc. Mot. Pict. Eng.* 46: 284, April 1946) and those approved for photography were published in May (*J. Phot. Soc. Amer.* 12: 207, May 1946). Six newly revised motion pictures standards were approved during the summer and published in September (*J. Soc. Mot. Pict. Eng.* 47: 258, September 1946). Details were also published of the nine standard test films for checking 16-mm equipment (*ibid.* 46: 511, June 1946).

Information was published by Russell on three new American standards related to specification of film speed (Z38.2.1-1946), spectral sensitivity of photographic emulsions (Z38.2.4-1946), and diffuse transmission density (Z38.2.5-1946). It was expected that these standards would assist greatly in clarifying and unifying terminology of these subjects (*J. Phot. Soc. Amer.* 12: 391 September 1946). A standard practice for conversions of weights and measures for photographic use (Z38.8.2-1945) was published (*ibid.* 12: 208, May 1946).

Bingham discussed sensitometric evaluation of reversible color film, a subject on which little had been published heretofore. (*J. Soc. Mot. Pict. Eng.* 46: 368, May 1946).

**Manufacture of Sensitized Materials.** Although photographic manufacturers pushed their plants to ca-

capacity production, the backlog of consumer needs resulting from the war was so great that dealers seldom received enough photographic materials to accumulate stocks. Toward the end of the year it was encouraging to note an increase in the available supplies of color materials.

The properties of three new 35-mm Ansco color films for professional motion pictures were described by Duerr and Harsh. The films were recommended respectively for camera use, duplicating, and release printing (*J. Soc. Mot. Pict. Eng.* 46: 357, May 1946). In the field of television, E. I. duPont de Nemours and Company announced a new motion picture film, known as Type 323, for photographing the television monitor tube and White and Boyer described its technical properties (*ibid.* 47: 152, August 1946). Another interesting paper in this field was that by Meschter which dealt with television reproduction from negative films (*ibid.* 47: 165, August 1946).

The Glenn L. Martin Company, Baltimore, announced an emulsion for coating metal, wood, plastic, and other surfaces on which drawings were to be reproduced. On heating the jelly-like substance to 125° F., it could be applied with a brush or sponge and when dried, was capable of exposure and development in the normal way (*Chem. and Met. Eng.* 53: 180, February 1946).

A rapid processing, fast-drying paper called Resisto was announced for sale by Eastman Kodak Company. This product had been a war development for rapid processing of maps and charts. The Dasonville Company, who had specialized in a single photo-product, a paper known as Charcoal Black, announced a new warm-tone paper, called Charcoal Ember (*Popular Phot.* 19: 119, December 1946). The making of sepia prints directly from color transparencies on Grant Panchroreversal paper was described by Sisto (*Camera*, Baltimore, 68: 28, June 1946).

The majority of sensitized photographic materials are packaged in sealed wrappings under a controlled temperature and humidity at the factory. Management of the moisture content after the package is opened has presented problems to users of film materials, especially in tropical climates. In this connection the paper by Kunz and Ives on the use of desiccants with undeveloped film was of interest (*J. Soc. Mot. Pict. Eng.* 46: 475, June 1946).

**Photographic Apparatus.** Although many manufacturers of photographic apparatus made a fairly rapid conversion of their plants from war to peacetime products, full-scale production was hampered by a shortage of certain raw materials, especially steel, and strikes held up still further the replenishment of necessary stock piles. Nevertheless a number of cameras, projectors, flash bulbs, etc., were marketed and some of the great back-log of orders was filled. Several firms introduced twin-reflex cameras, which had one lens above another, the upper serving as a view finder. Several of the older models of miniature cameras using 35-mm film appeared again on the market along with a few new cameras of this general type. One of the new ones was a stereoscopic miniature camera called the "Stereo-Realist." It was fitted with synchroflash shutter, a matched pair of f/3.5 coated lenses and a built-in range finder. A twin-lens viewer having a built-in light was used to examine the stereo-transparencies in either black-and-white or color (*Machine Design* 18: 149, March 1946). European progress in stereoscopy was discussed by Berssenbrugge who stated that the German Society of Stereoscopy held regular meetings throughout most of the war years. They used a stereoprojector

designed by Käsemann which had a beam-splitting condenser, two objectives adjustable laterally and vertically, and would accommodate pictures up to 6 by 13-cm. in size (*Amer. Phot.* 40: 28, March 1946).

Various wartime apparatus developments were made available for peacetime use. One of these, the Fairchild K-25 Sequence camera was said to have been used by the Associated Press for rapid consecutive action pictures, 4 by 5-inches in size, exposed at the rate of two per second. Possible combination of this camera with strobo-flash equipment was predicted (*Popular Phot.* 19: 82, July 1946). Besides the well-known Kodatron flash unit, others were in use under such trade names as Electroflash, the Electronic Flash Gun, Flash-Tronic, Amglo. One flash gun known as Magna-flash operated on magnetic power (*ibid* 19: 191, December 1946) while another called the Dyna-Flash Synchrogon had a tiny built-in a.c. generator which was wound manually (*Business Week* 18: 76, December 1, 1945). Technical details of the Raytheon CK-1013 cold cathode rectifier tubes which were used in photoflash equipment were published (*Rev. Scientific Instruments* 17: 245, June 1946).

A microcopying camera called the Duplex Recordak permitted simultaneous photography of both sides of checks and documents. The Cooke Orthocamera was designed to produce orthographic and isometric projections of objects. It had a very large lens highly corrected for spherical aberration and was used to photograph objects, of width equal to or less than the diameter of the lens. Podeyn gave details of a new cartographic camera manufactured by the Fairchild Camera and Instrument Corporation. To cover the needs for topographic and planimetric mapping work, lenses of three focal lengths, 5.2-inch, 6-inch, and 8.25-inch, could be used. The design provided for fully automatic operation or manual control (*Photogrammetric Eng.* 12: 345, September 1946).

An apparatus for the rapid production of photographic records in connection with processes requiring automatic recording or routine inspection was described by Brown, Blackmer, and Kunz (*J. Franklin Institute* 242: 203, September 1946). The instrument was designed to photograph on 16-mm film a transient image on a cathode-ray tube, develop the image, and project it on a screen,—all in the very short time of 15 seconds. Hot solutions (about 140° F.) were used to process the film, a fine grain positive (Eastman Type 5302). A special processing cup restricted the liquids to a small area on the film and spent solutions were removed quickly by suction. Rapid processing equipment will probably have applications in the field of television, documentary reproduction, and industrial processes.

During the war several firms designed a number of types of film processing and printing equipment having novel features which recommend their use for civilian purposes. Included in this group was the G-3 Daylight Film Tank, a compact unit for development of 16-mm or 35-mm film; the M-30 Film Dryer, and the M-20 Contact Printer, which used Argon lamps.

As a result of the tremendous expansion in commercial applications of 16-mm film in recent years, a need has arisen for more precision cameras, printers, and projectors. The Mitchell 16-Camera was announced as having the following features: motor drive; two-pin claw pulldown; rack-over focussing; 175-degree adjustable shutter; four-lens turret and detachable magazines of 400-foot capacity (*Amer.*

*Cinemat.* 27: 376, October 1946). Other available precision 16-mm cameras were the Cine Kodak Special, the Maurer Professional, and the Bell and Howell Eyemo. Western Electric marketed a new sound recorder for making any of the standard original or release type sound tracks on either 35-mm or 16-mm film (*ibid.* 27: 60, February 1946). Improved or new 16-mm sound projectors available on the American market included: RCA-Victor Model 201; Ampro Sound Premier 10; Sound Kodoscope FS-10-N; Filmo-sound; Victor Animatophone; DeVry RS-ND30.

In view of the use of dye image sound tracks on monopack and other multi-layer color films as compared with silver image tracks, a phototube was developed having its maximum response in the blue-green region of the spectrum. Technical data on this tube, known as 1P37, were published by Glover and Moore (*J. Soc. Mot. Pict. Eng.* 46: 379, May 1946).

To measure the color temperature of various light sources which may be used for photography, a device known as the Harrison Color Temperature Meter was marketed. It contained a revolving disk holding a series of color filters through which the light from the unknown source was examined and the correction filter for use with a specific film indicated (*Minicam Phot.* 9: 82, February 1946).

A complex gunnery trainer was described by Waller which used photography in several ways as an important part of the device. A five-camera unit was used to photograph a target area of such size that when the resulting films were projected with a group of five projectors, the images would fill a spherical screen, 150 degrees in width and 75 degrees in height (*J. Soc. Mot. Pict. Eng.* 47: 73, July 1946).

To prevent the fungus fouling in the tropics of optical instruments, Vickland recommended the use of metallic foil impregnated with radium sulfate, which gave off alpha radiation (*Ind. Eng. Chem.* 38: 774, August 1946).

**The Photographic Process.** The popularity continued of packaged chemicals in various sizes to make up different volumes of solution. With the introduction of new color films and papers which could be processed by the user it was generally believed that photographers would prefer to buy ready-mixed chemicals rather than mix their own solution from bulk chemicals. Chemical outfits were supplied by Ansco for development of Ansco Color film and Ansco Printon and Eastman marketed kits for processing Ektachrome film and Dye Transfer materials. Ektachrome processing required 90 minutes and used six tanks. An advantage claimed for their color developer was that it is less likely to cause skin irritation than developers in common use for black-and-white photography. Chemical oxidizer formulas were published for modifying the color balance of Agfa-color images (*Brit. J. Phot.* 93: 137, April 19, 1946) and of Ansco Color transparencies (*Ansonian* 10: 6, March-April 1946).

The age-old idea of combining development and fixation in one solution was introduced commercially as a packaged chemical known as Unidel. Use of a special hardener called Hi-Temp was recommended by the Eastman Kodak Company previous to development, intensification, or reduction. It was claimed that development could be conducted at temperatures as high as 95° F. with an ordinary developer after a short treatment in this hardener.

A preliminary survey of methods of hypersensitizing and latensification was made by Sheppard, Vanselow, and Quirk. In general it was concluded

that the gain in speed was accompanied by increased graininess and lowered resolving power (*J. Franklin Institute* 240: 439, December 1945). Four general methods of increasing film speed were discussed by Miller, Henn and Crabtree. These included: hypersensitizing the emulsion before exposure, intensifying the latent image between exposure and development, the use of high-emulsion-speed developers, and intensification of the negative after regular processing (*J. Phot. Soc. Amer.* 12: 586, November 1946). The chemistry of chromium and aluminum as agents for hardening gelatin was discussed by Baumbach and Gausman (*J. Soc. Mot. Pict. Eng.* 47: 22, July 1946).

**Bibliography.** Copies of European photographic journals that were able to continue publication during the war were received in the United States during the year and abstracts of the leading articles were published. Little was known, however, of the future continuity of publication of these journals, especially those printed in Germany.

In the United States, publication was started of two new photographic magazines, namely: *Travel and Camera*, published by the U.S. Camera Publishing Corporation, New York; and *Photographic Age*, published by the Trans-World Publishing Company, Inc., New York. The latter journal caters to the business and industrial user of photography.

The more noteworthy books were the following: *This Is Photography*. T. H. Miller and W. Brummitt (Garden City Publishing Co., Garden City, New York). *Okay for Sound*. F. Thrasher (Duell; New York). *The Technique of the Picture Story*. D. D. Mich and E. E. Berman (McGraw-Hill Book Co., New York). *Professional Photography for Profit*. C. Abel (Greenburg, New York). *Photography is a Language*. J. R. Whiting (Ziff-Davis Publishing Co., Chicago). *Mountain Photography*. C. D. Milner (Focal Press, London). *Fotografisk Handbok* (In Swedish) H. Backstrom (Sokforlaget Natur och Kultur, Stockholm, 2 vols., 1942). *Fotografia Astronomica*, J. Galli, (Correo Fotografico Sudamerico, Buenos Aires) *Mr. Lincoln's Camera Man*. R. Meredith (C Scribner's Sons; New York). *Image Management*, N. Haz (Haz Book Co., Cincinnati). *Photography by Infrared*, W. Clark (Wiley and Son, New York, 2nd Ed.). *Traité de photographie, Tome I. Optique*, C. Diserens, (F. Ronge and Company, Lausanne). *Faces of Destiny*. Y. Karsh (Ziff-Davis Publishing Co., Chicago). *The Art of the Motion Picture*. J. Benoit-Levy (Coward-McCann Inc., New York). *Synchronized Flashlight Photography* G. L. Wakefield and N. W. Smith (Fountain Press, London).

**Necrology.** The passing of two of the internationally great men in photography is noted: Alfred Steiglitz, New York, who was regarded as the dean of American photography (age 82 years); Dr. Josef Maria Eder, Kitzbühl, Austria, distinguished scientist and historian (age 90 years).

GLENN E. MATTHEWS.

**PHYSICS. High-Voltage Machines.** An array of new high-voltage machines was begun or completed during 1946. The world's largest cyclotron, 184 inches with magnets weighing 4,000 tons, was put into operation at the University of California under the direction of Dr. Ernest O. Lawrence.

Its construction was financed mainly by a gift of \$1,150,000 from the Rockefeller Foundation, which was augmented by funds from the Research Corporation, the John and Mary Markle Foundation and the University of California. Its completion is being forwarded with the assistance of the Manhattan District. During the war its magnets

were used for the separation of uranium 235 during atomic bomb research.

In the first experiment, a 200,000,000 electron volt beam of heavy hydrogen atomic hearts was produced. The deuteron beam was used to bombard beryllium and a sharp, intense beam of high energy neutrons resulted from the bombardment.

Engineering work by the University of California radiation crew headed by Prof. Robert L. Thornton and William Brobeck, solved operating difficulties more quickly than expected.

The atomic bomb element, plutonium, was made in a smaller cyclotron. Many entirely new nuclear reactions are expected to result from work with the new 184-inch cyclotron.

A new kind of high-voltage machine promises to speed along the hearts of atoms at accelerations of several hundred million or even billions of volts, comparable to or exceeding the cosmic rays from outer space.

The linear accelerator, as it is called, is being developed by Prof. Luis W. Alvarez of the University of California.

Using the resonating cavities from second-hand radar sets left over from the war, an accelerator about 40 feet long that will operate at about five million volts direct current was built to accelerate hydrogen atom hearts, protons, useful in all sorts of atomic or nuclear research such as produced the atomic bomb. Eventually the resonating units, each giving a kick to the particles, might be strung out for a mile or more in a straight line. This would give accelerations equivalent to hundreds of millions or even billions of volts if all goes well.

Work on the linear accelerator "atom-smasher" was begun when it appeared that the cyclotron had reached a limit in its voltage at about fifty million. This was before a frequency modulation scheme was used a few months ago with the cyclotron that now makes it possible to operate it at several hundred million volts.

Another atom-smasher, the synchrotron which has unusual qualities of its own, is being developed by Prof. Edwin M. McMillan. It will develop 300 million electron volts.

Powerful radiations from another kind of high-voltage machine, the betatron, can be used for spotting of flaws in heavy steel, giving increased detail and greater speed than ordinary X-ray equipment. The new 20,000,000-electron-volt betatron was completed by Allis-Chalmers for the U.S. Army arsenal, Picatinny, N. J.

For industrial X-ray work, the betatron's radiations can penetrate 20 inches of steel in 20 minutes and detect flaws .002 inches wide and one thirty-second of an inch deep. By making enlargements on radiograph film directly, the machine speeds the time required for X-ray inspection. One competent laboratory technician can operate the betatron, making it practical to X-ray with the betatron every piece of heavy equipment produced instead of the one out of 50 or 100 units as is now done.

The 100,000,000-volt betatron in the General Electric Research Laboratory had its output energy raised to 160,000,000 volts. Devised by W. F. Westendorp of the Laboratory's X-ray section, the method for increasing the voltage is called "DC bias." Briefly, this consists of applying a direct current to the electromagnet as well as an alternating current. Thus shifts the zero line from the middle of the current wave to its bottom and overcomes a difficulty caused by the fact that the magnetic field is in the wrong direction for guiding the electrons in their orbit while the voltage is passing from zero to its positive maximum.

**Nobel Prize.** Dr. P. W. Bridgman of Harvard University was awarded the Nobel prize for physics for 1946. The creation and study of enormous pressures, measured in millions of pounds per square inch, won Dr. Bridgman the award. Except for their lower temperatures, they approach conditions prevailing in the deep interior of the earth, and give us some idea of strange states in which ordinary matter may exist at a thousand miles straight down.

"Hot ice," or solid water 163 degrees Fahrenheit above ordinary boiling point, was produced in one of his massive presses, which can build pressure up to as much as six million pounds per square inch. This strange form of water is denser than ordinary ice, and will sink in water. In another of his experiments, Dr. Bridgman showed it to be highly unlikely that diamond can be formed from carbon by pressure alone.

**V-2 Rocket Research.** Firing a series of captured German V-2 rockets upward from White Sands, New Mexico, a variety of experiments was made in the upper atmosphere to a maximum altitude of 104 miles, achieved July 10.

Radiations from the sun, never observed before, were photographed. Much may be learned about the sun, the earth's primary source of energy, because of photographs taken of the sun's spectrum by a camera carried high into the air by the V-2 rocket fired on October 10. About 40 of these spectrograms were made at increasing altitudes up to 65 miles above the surface of the earth.

The new lines in the sun's spectrum are being identified and their intensities calculated. Scientists estimate that a full year will be needed actually to analyze the data. The spectrograph, used to extend the sun's spectrum, was mounted on a rocket fired at the Army's White Sands Proving Grounds in New Mexico. The Naval Research Laboratory and Army Ordnance Department at White Sands worked together in conducting the experiments. As the rocket rose, the spectrograph operated continuously, producing a series of photographs at various altitudes up to 65 miles. Rotation of the rocket turned the spectrograph away from the sun above that height, so spectrograms could not be made.

The sunlight that reaches the earth is filtered by the ozone in the atmosphere, most of which is concentrated near the earth. Only a small proportion of the shorter wavelengths, those lying on the X-ray side of the visible spectrum, ever reaches the ground surface.

Cosmic rays were counted 40 miles upward at approximately 20 times the rate found on the earth's surface on June 28.

From between altitudes of 200,000 feet and 350,000 feet, multi-channel radio equipment showed the high radiation. While scientists estimated that about 70 percent of the cosmic rays reaching the ground are "hard count" rays that can penetrate six inches of lead, "practically all" the cosmic rays above 40 miles were described as "hard count."

Only 41 seconds of data were gathered by the rocket, the scientists reported, with radio interference blanking out most of the 353-second flight. Data from Geiger counters in the rocket were relayed to ground observers by the radio equipment and were received only for intervals after the rocket had reached 40 miles high and before it began to fall to earth.

Record-breaking high-altitude observations obtained on July 30, by Johns Hopkins University Applied Physics Laboratory apparatus in a V-2 showed that cosmic ray showers were 300 times

more numerous in the upper atmosphere than at the ground level. The peak concentration of the mesotron particles generated by the cosmic rays was at 100,000 feet (19 miles).

**Electron Microscope.** The useful magnifying power of the electron microscope was increased from 100,000 diameters to more than 200,000 diameters by an improved magnetic lens developed by Dr. James Hillier, aided by Perry C. Smith, at the RCA laboratories.

The magnetic lenses that focus the electron beams were improved to such an extent that it is now possible to distinguish particles separated by as short a distance as 13 Angstrom units, or about 50 billionths of an inch. This means roughly that 50,000 distinct particles could be recognized in a distance equal to the width of a hair. Numerous technical problems still await solution before such high resolving power will be available generally.

Structural details of large molecules and the action of drugs on bacteria will be among the things that will become visible. Actual visual pictures of molecular structure will open vast new fields in organic chemistry. New knowledge of the finer structure of viruses and living cells would aid the fight against unconquered diseases, such as infantile paralysis and cancer.

**Infra-Red Receivers.** Lifting of war secrecy allowed announcement of the use of infra-red devices in various ways during the war, particularly the sniperscope and snooperscope with which a marksman could see his human target by means of reflected heat waves. The snooperscope and sniperscope are identical in principle. The first is a complete instrument held in front of the user by one hand. The other is in two pieces that are attached to a carbine. Both have an infra-red lamp that sends out an invisible beam of what some call "black" light. Both have receivers that pick up returned light from the object observed and convert it from invisible light to a visible image. The object appears greenish in hue, but is plainly outlined.

The sniperscope, attachable to the carbine, has one part under the barrel and one over. The under part is the tube containing an infra-red lamp. The face of the tube is painted black so that no visible light can escape. The upper mounting is a special telescope, the receiver for the reflected rays. Both are powered from a supply unit carried on the user's back which contains a six-volt battery and a vibrator.

The transformation inside the telescope receiver that receives the reflected invisible rays and makes a visible image is brought about by the use of electrons inside the tube of the instrument. The reflected infra-red rays picked up on the objective lens are focused on an image tube. When they strike this image tube, electrons are released in direct proportion to the intensity of the rays.

As all electrons possess a negative electric charge, the released electrons are attracted to a positive plate. They are accelerated as they pass through the tube to a fluorescent screen. They bombard the screen and produce a visible image corresponding to the invisible infra-red image on the front screen. The power for action is from the vibrator.

The usual snooperscope is carried by hand in front of the user, but there is another kind. In this the device to shoot out the infra-red beam is mounted on the front of a jeep or tank and the driver is equipped with headgear, a so-called infra-red-sensitive helmet, with the receiving telescope attached to its visor. The infra-red lamp used in the snooperscope consumes five amperes at six volts. The receiving tube requires 4,500 volts,

which is supplied by the vibrator in the power supply unit.

Nazis, as well as Allies, had an infra-red night-seeing instrument called a "heat-eye tube." It was a mass-produced cathode tube powered by a midget generator. With it the Germans used a searchlight with the lens painted out to block the emission of any visible light. In the receiving heat-eye tube, the reflected heat-image fell on a selenium film and dislodged electrons were drawn magnetically through a vacuum tube and focused directly on a fluorescent view-piece. American scientists, however, are working out improved snooperscopes, and also better methods of using infra-red rays in telephonic communication.

A super-sensitive, super-conductive bolometer, developed at Johns Hopkins, was used in sending heat signals over telephone wires. A bolometer is a delicate heat detecting or measuring instrument. This bolometer, a delicate infra-red "eye," contains metal strips whose electrical conductivity is altered by heat waves falling on them. When hit by a heat ray that warms it only one millionth of a degree, it gives a clear electrical signal. It can register the heat from a living person 500 yards away, and when attached to a scanning device, a television-type viewing screen, can produce a rough picture of any warm object.

In this bolometer, columbium nitride is used for its sensitive receiving surface. This rare-metal nitrogen salt is cooled by the use of liquid hydrogen to 432 degrees below zero Fahrenheit, at which temperature its electrical resistance is exceedingly low. For this reason, it is superconductive.

**"Sofar."** An underwater sound system developed by the Navy in cooperation with Woods Hole, Massachusetts, Oceanographic Institution makes it possible to locate air and ship survivors far at sea. The system, called SOFAR, utilizes a TNT charge dropped underwater by the survivor and timed to explode at a depth of 3,000 to 4,000 feet, which sets up underwater sound waves that are picked up by hydrophones at shore stations. Survivors can be located within a square mile of sea as far as 2,000 miles from shore.

To determine the location of the survivor the underwater sound waves must be picked up by three widely separated shore stations, using hydrophones at the same depth. By comparing the times when the signal is received and then referring the differences to special charts, station operators are able to plot the position of the explosion within a few minutes after the most distant station receives it.

The new system's name, SOFAR, has no relation to the great distance through which it can be used, but comes from the initial letters of the phrase "Sound Fixing and Ranging." SOFAR depends upon an underwater sound zone, the existence of which was confirmed as a by-product of wartime submarine detection studies carried on for the Navy by Dr. Maurice Ewing while director of research in physics for Woods Hole Oceanographic Institution.

As the result of this "speaking-tube" effect, sound travels amazingly far in the depth zone between 2,000 and 6,000 feet. During tests conducted in the Bahamas, sound within the zone was heard with useful intensity a distance of 3,100 miles. No other man-made sound has ever been heard more than a small fraction of this distance. However, at a depth of 600 feet the TNT bomb explosion could be heard for distances of only 100 to 300 miles. Although the sound lasts less than a second at the point of explosion, it is heard for 24 seconds 2,000

miles away. The signal at the receiving hydrophones is likened to a kettledrum building up to a sharp, grand finale. The sharp concluding sound makes possible time measurements within one-tenth of a second.

**Artificial Snow.** Man-made snow was created for the first time in a laboratory. Using dry-ice fragments against a cloud of supercooled droplets in a cold chamber, Vincent J. Schaefer of General Electric found that the droplets formed ice crystals that fell like snow.

Natural clouds were bombarded with the solid carbon dioxide from an airplane to form the crystals and cleared away clouds. Such a process might be used in the future to clear dangerous supercooled clouds over airfields. Supercooled clouds were formed by introducing moist air into a small commercial freezing unit with the temperature of the resulting cloud about minus 15 degrees Centigrade.

A piece of dry-ice hung in the cooled cloud, converted the cloud into ice crystals in 10 seconds. The crystals increased in size when more moisture was added. The crystals were similar to those of "diamond dust," the small natural crystals found on cold mornings.

**Visual Sound Pattern.** A sound spectrograph translates any sound into a visual pattern. With a little training, deaf persons can learn to read the patterns and literally see what the other party has to say. Drs. W. Koeng, H. K. Dunn, and L. Y. Lacy of the Bell Telephone Laboratories are inventors of the sound spectrograph. The new instrument would be used first for the rapid and accurate analysis of sound. It is a wave analyzer that produces a permanent visual record of the sound's energy distribution in both frequency and time.

**Ocean Blue.** Why the ocean is blue was found in a research attempt to use light rays in anti-submarine warfare during the war. There exist in every cubic inch of clear ocean water about a million and a half dust-like particles, each about one fifty-thousandth of an inch in diameter. These particles reflect sunlight back to the ocean surface. But the light that gets back to the surface has been filtered; water absorbs the red and yellow colors of light, leaving greens, blues and violets, the combination of which is the indigo blue common to deep ocean water.

Previously the scientific explanation for this color had been attributed to the scattering by molecules of water, just as the blue of the sky is explained by scattering due to air molecules. Less scientific explanations held that the ocean's color was a reflection of the blue sky.

Dr. F. A. Jenkins, professor of physics at the University of California, and Dr. I. S. Bowen, now director of the Mount Wilson Observatory, conducted the research in 1941 at the U.S. Navy Electronics Laboratory in San Diego, using some of the facilities of the University of California's Scripps Institution of Oceanography.

The tiny particles played a major role in blocking efforts to devise anti-submarine devices using light. The billions of particles suspended in the ocean, intercepting light as it passes through water, set a limit of penetration of a ray of light at a maximum of 580 feet. This limitation eliminated hopes of silhouetting submarines by dropping airplane flares below them, since it was impractical below about 200 feet. Scattering of light by the particles also prevented bouncing light rays off submarines, similar to the use of radio waves in radar. The same limitation was found in attempts to devise an optical proximity fuze for depth

charges by installing a light projector in the nose of the projectile.

Drs. Jenkins and Bowen discovered and counted the tiny particles with an ultra-microscope, which makes it possible to see objects smaller than light waves. Light is scattered by the particles, bringing them into visibility.

**Color Television.** Color television was accomplished by an all-electronic means, a complete departure from television in mechanical color which has been shown in various forms during the past few years.

A color-slide television camera, developed by the Radio Corporation of America, produces signals from 35-millimeter Kodachrome slides. Transmission of the picture on the slide is achieved in natural colors when a light beam from a kinescope is focused through the slide and separated into component colors by a system of mirrors and photoelectric cells.

Each of the three transmitted images, red, blue and green, is of the same number of lines, 525; also the same horizontal scanning rate and the same picture repetition rate of 30 pictures a second as in present commercial television broadcasting.

The receiving set has three kinescopes, which separately receive the signals representing the three colors. From them the three color images are optically projected into a bright composite picture which appears on a 15-by-20-inch screen in natural color.

**Bibliography.** Among the new books on physics issued in 1946 were: N. Arley, *Cosmic Radiation and Negative Proton* (Munksgaard); N. H. Black and H. N. Davis, *New Practical Physics* (Macmillan); N. H. Black, *New Laboratory Experiments in Practical Physics* (Macmillan); M. Born, *Atomic Physics* (Blackie & Sons); G. M. Chute, *Electronics in Industry* (McGraw-Hill); J. A. Clark, *Workbook in Physics* (Houghton); N. M. Cooke and J. Markus, *Electronics Dictionary* (McGraw-Hill); D. Dietz, *Atomic Energy Now and Tomorrow* (Westhouse); P. Frank, *Foundations of Physics* (Univ. of Chicago Press); O. R. Frisch, *Meet the Atoms* (Wyn); G. Gamow, *Atomic Energy In Cosmic and Human Life* (Macmillan); W. D. Henderson, *Physics Guide and Laboratory Exercises* (Lyons); H. B. Lemon, *From Galileo to the Nuclear Age* (Univ. of Chicago Press); H. B. Lemon and M. Ference, *Analytical Experimental Physics* (Univ. of Chicago Press); O. Lühr, *Physics Tells Why* (Cattell); S. L. Martin and A. K. Connor, *Basic Physics* (Whitcombe & Tombs); R. A. Millikan, *Electrons (plus and minus)* (Univ. of Chicago Press); M. Nelkon, *Physics and Radio* (Arnold, E. & Co.); A. Pap, *A Priori in Physical Theory* (King's Crown Press); B. A. W. R. Russell, *Physics and Experience* (Macmillan); F. W. Sears, *Principles of Physics* (Addison-Wesley); H. Semat, *Introduction to Atomic Physics* (Rinehart); J. Shannon, *The Amazing Electron* (Bruce); H. D. Smyth, *Atomic Energy for Military Purposes* (Princeton Univ. Press); A. K. Solomon, *Why Smash Atoms* (Harvard Univ. Press); J. Stokley, *Electrons in Action* (Embassy); United Nations (Organization) Atomic Energy Commission, *Scientific and Technical Aspects of the Control of Atomic Energy* (Columbia Univ. Press); R. C. Walker, *Electronic Equipment and Accessories* (Chemical Pub. Co.); W. G. Whitman and A. P. Peck, *Physics* (American Book).

WATSON DAVIS.

**PITCAIRN ISLAND.** An island in the South Pacific, approximately midway between South America and

Australia. Area: 2 square miles. Population (June 30, 1943): 177. The island was originally settled in 1790 by mutineers from H.M.S. *Bounty* and native men and women from Tahiti. In 1902 the islands of Ducie, Henderson, and Oeno were annexed by Great Britain and are now included in the district of Pitcairn. The agricultural products are yams, taro, maize, sweet potatoes, bananas, pumpkins, oranges, melons, pineapples, arrowroot, sugar, and coffee. The Government is administered by an annually elected council of 5 members headed by a Chief Magistrate subject to the control of the British High Commissioner for the Western Pacific. Chief Magistrate: Parkin Christian.

**PLANT INDUSTRY, SOILS, AND AGRICULTURAL ENGINEERING.** Bureau of. A Bureau of the U.S. Department of Agriculture, created as the Bureau of Plant Industry in 1902. Activities include investigations of plant production and improvements of soils in which they are grown and the engineering problems concerned with farming. Headquarters: Plant Industry Station, Beltsville, Md. Chief: Robert M. Salter.

**PLASTICS.** Progress in the plastics industries in 1946 was more a matter of development than of discovery. As pent-up demand for plastic products made itself felt, the molders, laminators and fabricators turned all efforts towards faster output while material suppliers strained to meet their requirements in resins and compounds. Research was therefore concentrated on peacetime applications of warborn techniques, on broader uses for those few materials in good supply, and on speeding up production cycles. The review of the plastics industry for 1946 and forecast for 1947 appearing in the January, 1947 number of *Modern Plastics* magazine shows this effect of industrial economics on plastics. Some of the highlights are presented here.

Only one new resin, polytetrafluoroethylene, marketed under the trade name of Teflon, was introduced during the year. This material is inert to all types of chemicals except molten alkali metals. It does not have a true melting point but does undergo a solid phase change at 620° F. with a corresponding sharp drop in strength. Because of this high softening point it can be shaped only by special techniques. Suggested applications include coaxial cable spacers, valve packings, gaskets, and plug cocks and tubing for chemical plant equipment.

The 1945 newcomer, cellulose propionate, a thermoplastic, underwent test use in products under the name of Forticel, and promised to develop a worthwhile market. The silicone polymers were brought closer to application in electrical insulation, protective coatings, laminates, radio uses and rubberlike products. Experiments to improve the handling and curing characteristics of the polyester or low-pressure, low-heat, thermosetting resins and to secure the best strength qualities in products made from them were many.

Improvements were made in the structure of polyethylene films for packaging. Modification of the properties of polystyrene for injection molding and coating involved some research. Advances in vinyl resin technology were concerned with compounding and fabrication of sheeting, the use of latex-type dispersions in water for coating fabrics and papers and copolymerization of 95 parts ethyl acrylate with 5 parts chloroethyl vinyl ether to make a vulcanizable elastomer possessing superior resistance to oils and heat.

Low-pressure phenolic laminating resins came

out of pilot plant stage to undergo tests in products. Cellular, foamed, or expanded plastics of several kinds, but particularly cellular cellulose acetate, were given further refinement from the standpoint of application.

Some research was devoted to plastics, notably vinyl acetate, in paints and lacquers. Work proceeded in the adhesive field on alkyd resins, on vinyls and the resorcinols. Most of the effort of material suppliers' laboratories went towards the improvement of existing materials, towards more formulations of them to increase their range of use, and towards better standards and tests. The literature of the industry reflects the amount of this work in 1946 in almost twice as many references as there were in 1945.

If dramatic new developments in materials were few, the lack was more than made up for by tremendously broadened applications of plastics and by a constant stream of new methods of using them, either by themselves or in combination with wood, paper, fabric, glass, fiber, and other substances.

In spite of a woeful shortage of plasticizers, witnessed by the fact that vinyl production rose from 122,000,000 lb. in 1945 to 145,000,000 lb. in 1946 while plasticizer production dropped from 48,000,000 lb. to 45,000,000 lb. (and vinyls require from 30 to 40 percent plasticizer for most applications), the vinyls reached the consumer in a magnificent variety of products.

In flexible formulations, printed or tinted and either sewn or electronically heat-sealed, the vinyls appeared as shower curtains, drapes, table cloths and covers, refrigerator bowl covers, rainwear, lamp shade protectors, and other things. A new printing method involved the casting of a design into a film. The design is printed with vinyl-base inks on a melamine-surfaced carrier sheet of kraft paper; the resin is cast on top of the printing, run through a tunnel in which solvents are removed, cooled to form a film and when the film is wound off the carrier the printing is part of it, leaving the kraft sheet clear for further use. Roll printing of vinyl is standard today and even that has been improved during the past year through chemistry.

The electronic heat-sealing or sewing, first used during the war in the manufacture of salt water stills, produces a fusing of material that makes for greatest strength at the seam. Both bar-type sealers and wheel type are available. Their use in making pillows, garment bags, rainwear and other air-tight pieces is growing.

Rigid vinyl sheeting, generally transparent, is now widely used in drawn and fabricated packaging. Here it competes with acetate, where it offers greater dimensional stability in the presence of moisture. It is considerably more expensive.

Both supported (fabric backed) and unsupported vinyl are used in furniture coverings. Handled like leather they are available in delicate colors, can withstand stains and abrasion readily, and may be cleaned with a damp cloth. Vinylidene chloride, under the trade name of Saran, is extruded in monofilaments and woven into fabric of many colors for open automobile upholstery, for theater seating and transportation seating. It is also made into sag-proof, weatherproof window screening which is available in various colors.

The vinyls, both vinyl chloracetate and vinyl butyral, are used as coatings for fabrics, to make them wear- and stain-resistant. Outdoor furniture made with fabric so treated came on the market in 1946. Vinyls are applied to paper, for use as wall coverings. Vinyl floor tile permits of lighter and

brighter coloring than asphalt tile, is grease-and-scuff proof, and is easily cleaned.

Vinyl resin production, resulting in hundreds of kinds of products made from seven or more compounds, and not including plasticizer, has risen from 1,200,000 lb. in 1939 to 145,000,000 lb. in 1946. It may reach 235,000,000 lb. in 1947.

The phenolics, at the war's end, went straight back into radio cabinets, iron handles, and other compression-molded articles in great demand, as well as into more varnishes for high pressure laminators. New electronic pre-heating devices, using either preformed "pills" or powder, speeded up molding cycles by partially curing the material before it went into the press.

It was in other directions, though, that phenolics showed the most advance in 1946. First, there were the low-pressure phenolic resins mentioned above; then there were the phenolic-impregnated papers for use in surfacing plywood and for making all-paper printed laminates. These new varnishes are practically transparent, they cure at low pressures and temperatures; they give to wood or paper a highly resistant surface.

Despite the increased production rate on phenolic molding compounds from 10,000,000 lb. monthly during the war to 14,640,000 lb. in August, 1946, no molder got enough in the past year. Demands for phenolics for housings, handles, radios, and a host of other products, coupled with faster molding methods, raised the need for this material. Strikes in the coal fields, cutting off coke, the source of benzol, cresol, and phenol, so important in phenol-formaldehyde manufacture, limited the supply. Phenolic molding compound production in 1946 was 140,000,000 lb. as compared with 65,000,000 lb. in 1939. It is expected to reach 170,000,000 lb. in 1947.

Most sensational increase in production for any plastic during 1946 was polystyrene. From 750,000 lb. in 1939 it has reached 55,000,000 lb. during 1946 and in 1947, if all plant expansions go through, it should amount to 150,000,000 lb. or more. As an injection-molding material it enjoys good dimensional stability, good color qualities, low specific gravity, and low price. Some problems in de-gating molded pieces and in mold design for the resin have been overcome in the past year. In a variety of formulations it will appear in an increasing number of small molded pieces, in extruded panels for fluorescent lighting fixtures, and, as polystyrene foam, as core material for various uses.

A new development is the use of polystyrene sheet in formed packages. While not as transparent as vinyl rigid sheet or as cellulose acetate, it forms well and has a utilitarian market.

The cellulose makers increased 1946 production beyond their hopes and in 1947 except to produce 131,000,000 lb. Cotton linters at high prices and shortages of dyes, pigments, and plasticizers were bothersome, although reworked scrap helped out the total supply situation a little.

Cellulose acetate continues to be a favored molding material, due to good strength qualities and ease of handling. But acetate sheet is moving up rapidly as an outlet. Formed and drawn into packages, laminated in heavier grades for lampshade material, it is expected to reach 26,000,000 lb. in volume in 1947. New equipment for automatically forming sheet into boxes will help.

Ethyl cellulose, the material used in the nose of the proximity fuze, is beginning to appear in peacetime products. Two or three small radio cabinets injection-molded from ethyl cellulose will be on the market shortly.

Hercules Powder Company has recently introduced a cellulose-derivative low-pressure thermoplastic laminating resin, and pieces such as small luggage are being made from it. Cloth is the filler and the material is declared to be formable on inexpensive dies in addition to being tough and light.

In the use of all cellulosic molding compounds, polystyrene, molding acrylic, molding nylon, etc., the improvement in injection-molding machines and extruding equipment—as well as the increase in their capacities—is worth noting. Over half of the injection molders added presses during 1946, bringing the present total up to 3,275 machines as compared with about 1,000 in 1941. Most of the new machines average 8-oz. size, while a few are much larger. Extrusion presses number 1,150 compared with 650 in 1944. All are bigger and faster.

As with the phenolics, the ureas and melamines are broadening their market. First, larger pieces are being molded; second, these resins are going into textile-treating and into adhesives. Melamine, rag- or alpha-cellulose filled, tableware for restaurants is undergoing use tests and promises to offer good sales volume. Melamine is standard varnish for top sheet of decorative laminates which have a dark phenolic core. It is going into buttons, into industrial applications such as melamine-glass fibre electrical panel board, and into heat-resistant uses. Urea continues to be used in small radio cabinets, lighting fixtures, and similar applications and new formulations have improved qualities. They are much less brittle.

Polyethylene has progressed from the application standpoint. Tumblers, infants' toys, and other small items are being molded. But most attention is being paid to packaging, where resistance to cold temperatures and moisture is important.

The acrylics, for a few months after the war, suffered from bad fabrication (generally of scrap materials) by people who knew neither materials nor design. That situation has righted itself and new laminating, engraving and die-cutting methods are causing a host of new applications to appear. Injection-molded acrylics are going into brushbacks, combs, cutlery handles and costume jewelry. Fabricated material is being used for its light piping qualities in displays, packages and lighting devices. A new formulation of the cast material is boilable and is used in surgeons' appliances.

Research activity on applications of the acryloid resins is being kept very quiet, but these are being used to some extent as tarnish-proof coatings for silverware, and for specialized impregnations. They are also combined with other resins for various special purposes.

In the low-pressure molding and laminating field, peacetime adaptations of techniques used during the war were seen in increasing number in 1946. Glass mat, impregnated with polyester resin was produced in flat lamination to be made up into lamp shades. The same combination, molded, appeared in some luggage, in industrial devices, and in the form of a street lamp globe which could withstand the impact of stones and air rifle pellets yet has good light refraction properties. Large pieces were low-pressure molded from fabrics plus either polyester resin or low-pressure phenolics. Specialty boats began to appear; but costs were a factor limiting volume. For short runs, where cost of steel dies would be impossibly high, the technique was adapted to trailer fenders. The use of the rubber blanket and autoclave seemed to be on the way out, reasons being high cost of labor in the operation, short life of rubber blankets or bags, and long cycle. For such large pieces as were

formerly made in autoclaves, newer polyester resins curing under lower pressure and temperatures (one curable in sunlight) were commanding attention.

Deep drawn laminates were made from knit fabric and polyester resin on compression-type presses in steel or cast-alloy male and female dies. Close tolerances and long and fast runs were the reasons why these metal dies were used. The products resulting were ice buckets, hulls for model sailing yachts, and a few housings.

Nylon has been going into molding plants in increasing quantities. Many of the applications are industrial, such as valve seats. Unbreakable and boilable tumblers in color and childrens' feeding sets were consumer products which reflected the high qualities of Nylon.

Most rumorworthy element in the whole plastics field—outside of material shortages—was the continuous contact laminate. These laminates are made by feeding cloth, glass fabric, or paper, or combinations of them from rolls through a dip tank where they receive the polyester resin. The ply, passing through squeeze rolls, is picked up between a top and bottom sheet of cellophane wider than the laminate assembly. A textile tenter frame grasps the cellophane at the sides and travels the laminate through a curing tunnel either in hot air or under infra-red lamps. The cellophane acts as the pressure element in producing the laminate, which comes out of the tunnel at rates up to 15 feet per minute. Little labor is involved.

Those concerned with this process claim that it will do for plastics what the rolling of sheet steel did for the metal industry. The laminates may be made flexible or stiff; they can be made flame resistant; they are inert to most ordinary household acids; they weigh about half as much as aluminum; they have reasonably good abrasion resistance.

At the year's end, no consumer goods had yet been produced from these continuous laminates, but they are expected to compete in the wall covering field, in the table-top field, in post-formed applications too numerous to mention. They are fairly expensive at present and two possibilities for economy are declared to be the coating of fabric or paper with polyester (as against the present complete impregnation) and the development of paper filled post-formable contact laminates.

Applications for both high- and low-pressure sheet laminates were dependent to some extent on the core material situation which was not good. Plywood, as a core for table tops and wall panels lagged far behind demand, even though 1946 softwood plywood total reached 1,500,000,000 square feet.

Howard Smith Paper Mills Limited in Canada produced a melamine-surfaced laminate with a phenolic and lignin base; thick pieces for table tops and thin ones for wall panels. Honeycomb, developed by Glenn L. Martin Company and U.S. Plywood Company, was still in short supply and sold at around a dollar a pound for  $\frac{3}{4}$  in. thickness. A cheaper method of making honeycomb was under development by Virginia Lincoln Co. This process amounted to the making of a glued paper assembly, pulling it open like a Christmas bell, impregnating it with resin and curing it and then slicing it into panels. Again, the material is not reaching the market in any quantities, although its possibilities in the construction industry are many.

Textile-treating resins, designed to make wool unshrinkable and moth-proof, to give fabrics a permanent starch-like crispness and to prevent wrinkling were brought into use in quantity during

the year. While amounts used per garment are very small, the total volume possibilities are tremendous.

Every major material supplier has plans for expansion in 1947 and many new plants are going up. Production of all synthetic resins and cellulosic plastics materials rose from 247,000,000 lb. in 1939 to 1,200,000,000 lb. in 1946. There is still a shortage due to the tremendous demands being made upon the industry. It is expected that at least 1,600,000,000 lb. of plastic materials will be produced in 1947. This production, it is hoped, will bring supply closer to demand.

A development of increasing interest is the attention being given in the plastics industries to merchandising and informative labelling. While this interest is very slight to date, the fact that four of the big material suppliers are aggressively merchandising their trade names through the processors to the consumer and the fact that plastics molders and fabricators are developing more proprietary items under their own control will have some bearing on this phase of plastics in the next few years.

CHARLES A. BREKIN.

**POLAND.** A central European republic, established Nov. 9, 1918. It was invaded by Germany Sept. 1, 1939, partitioned between Germany and the U.S.S.R. by the treaty of Sept. 28, 1939, and completely occupied by German forces after the outbreak of the Russo-German war on June 22, 1941. The liberation of Poland, begun early in 1944, was completed in the spring of 1945.

**Area and Population.** The territorial limits of the new Poland have not yet been finally drawn and no precise figures are available on its area and population. A blueprint of Poland's future boundaries was provided by the decisions of the Postdam (Berlin) Conference of July 17-Aug. 2, 1945, which placed under Polish administration all German territories east of the Oder and (Western) Neisse rivers, with the exception of a portion of East Prussia. Previously, it had been agreed at the Crimea (Yalta) Conference that Poland's eastern boundary should run along the Curzon Line. The area of Poland within these provisional new boundaries is 124,642 square miles with a population of between 23 and 24 millions. Population (census of February, 1946), 23,600,000. Capital: Warsaw (population, 448,000).

**Government.** Political and social conditions in Poland are in flux. A new Constitution has not yet been drawn up. By and large, however, the original Constitution of the Polish Republic of 1921 has been revived and the semi-dictatorial Constitution, introduced by Pilsudski in 1935, has been discarded by the Polish Provisional Government of National Unity set up on June 28, 1945. Pending the general election which this government is pledged to hold at the earliest possible moment, the Home National Council serves as interim parliament. The Council's 7-man presidency, headed by Boleslaw Berut, exercises the prerogatives of the President of the republic, whose position is vacant. Premier, Edward Osobka-Morawski.

**Events.** Long-suffering Poland found no peace in 1946. An endless succession of incidents, acts of violence, reprisals, and diplomatic protests formed the year's principal events. Against this backdrop of continuous trouble, however, the Polish people toiled doggedly for improved living conditions and a brighter future. Toward the year's end, the prospects for the eventual emergence of a strong and prosperous Poland appeared fairly good, provided that the Poles could overcome their traditional fac-

tionalism in 1947, and find the national unity which History has so long denied them.

**Verge of Civil War.** That the formation of the "Government of National Unity" in June 1945 had failed to put an end to the bitter struggle between the former London Poles and the Moscow-sponsored group became painfully apparent early in the year. While the "legal opposition" offered to the regime by Vice-Premier Stanislaw Mikolajczyk's own party, the Polish Peasant party or P.S.L., hardened from month to month, guerrilla warfare between Government forces and armed anti-Communist bands assumed steadily growing proportions.

Late in January, both British Foreign Secretary, Ernest Bevin, and United States Secretary of State, James F. Byrnes, expressed open concern at the number of political murders being committed in Poland and indicated that, according to official reports received by them, the Polish Security Police appeared to be implicated in some of these murders. The Polish Minister of Public Security, Stanislaw Radkiewicz, rejected these charges as "groundless," and declared in rebuttal that underground terrorists had committed more than 2,000 murders of Government agents, political leaders and Jews. Radkiewicz mentioned in particular the terrorist organizations W.I.N. (Freedom and Independence) and N.S.Z. (National Armed Forces), which he linked directly to the Polish troops-in-exile still stationed in Italy and Great Britain. The Leftist press also charged the Peasant party with secretly abetting the terrorists.

Whatever the truth of these charges and counter-charges, one fact stood out: that a regular, small-scale civil war was going on in Poland and was growing in fury as the months went by. At regular intervals, the Polish press published warlike communiques issued by the Ministry of Defense and reporting the liquidation of so many hundred "bandits" in this or that area. The district of Radom and the Polish-Ukrainian border region were frequently named in these communiques. Throughout the year also Polish tribunals were busy sentencing captured terrorists. In March, for instance, nine N.S.Z. men were condemned to death by the Warsaw Military Court; five at Katowice; and three at Koszalin. That the underground warfare took a large toll of Government forces, too, was freely admitted by official sources. By Oct. 15, the total of Polish soldiers, members of the militia, and security police agents slain since the beginning of the year stood at 1,298, while 1,185 civilian supporters of the regime had likewise been killed by the underground.

**A Plebiscite, But No Elections.** When the Government of National Unity was formed, it promised to hold "free and unfettered" elections at the earliest possible moment; this pledge had been a prerequisite for American and British recognition of the new regime in Warsaw. The Potsdam Agreement of August 2, 1945 again impressed the importance of early and free elections on the new Government. On April 24, 1946, Ambassador Oscar Lange informed the United States Department of State that elections would take place "this year." All these promises notwithstanding, no general election was held in 1946.

The Polish Government's standard excuse for its failure to hold the election in due time was "unsettled political conditions." Actually, the reason that one postponement after another of the date tentatively set for the poll occurred was that Mikolajczyk and his Peasant party refused to join in a "bloc ticket," i.e., a pre-electoral arrangement as-

signing each major party a certain share of the 444 Polish Parliament seats in advance. It was over this issue that the first open break between the P.S.L. and the other parties represented in the Government occurred late in February. From that moment on, the P.S.L. and its leader Mikolajczyk were constantly heckled by the Government's press and harassed by its police. On May 11, Premier Edward Osobka-Morawski made a strong attack on what he called "Fascist groups" active within the Peasant party. In an aggressive retort, Mikolajczyk on June 5 charged the Leftist majority in the Government with trying to destroy the P.S.L. through force and secret police action. "The breaking up of our party is to be accomplished through the citizens' militia reserve organization, through armed bands, and through special courts," he declared.

Mikolajczyk also opposed a national referendum set for June 30, which both the Peasant party leader and the Western Powers regarded as a poor substitute for the missing general election. In this plebiscite, the electorate was asked to approve or repudiate the Government's policy on four important issues: (1) abolition of the Senate and establishment of a unicameral Parliament; (2) the already completed agrarian reform, (3) the nationalization of all basic industries and of enterprises employing more than 50 persons, which had been decreed on Jan. 4, 1946; and (4) the westward extension of the Polish frontier to the Oder and Neisse rivers.

The bloc of Leftist parties under Communist leadership which held the reins of government urged the voters to endorse the regime by casting affirmative ballots on all questions. The Peasant party was split on the parliamentary issue. While Mikolajczyk and a majority of the party leaders favored retention of a bicameral Parliament, four members of the P.S.L.'s executive board expressed themselves in favor of abolishing the Senate; they were expelled from the party on June 15. On the other questions of the referendum, the P.S.L. also recommended to the electorate to vote in the affirmative.

The results of the plebiscite, made public on July 8, were as follows: abolition of the Senate, 7,844,522 "yes" and 3,686,029 "no"; agrarian reform and nationalization, 8,896,105 "yes" and 2,634,446 "no"; western border, 10,534,679 "yes," and 995,854 "no." Mikolajczyk immediately demanded that the poll be set aside as not valid, because of widespread fraud and forgery of returns alleged by him, but the charges were dismissed by the general commissioner in charge of the balloting.

After studying detailed reports sent by their official representatives in Warsaw, the American and British governments on Aug. 20 protested, in parallel notes to the Polish Government, against alleged "serious irregularities" in tabulating the ballots, and "oppressive acts" against the P.S.L. in the campaign preceding the plebiscite. The two notes went on to suggest that all democratic parties be allowed to campaign freely at the forthcoming elections and that ballots be counted in the presence of representatives of all parties. The Polish Government, on Aug. 27, rejected the American-British representations and charged that they constituted "an infringement into Poland's sovereign rights and interference with her internal affairs."

Meanwhile, new pressure had been brought to bear on Mikolajczyk and the P.S.L. to obtain their acceptance of the coalition slate proposed by the Leftist bloc of parties; Mikolajczyk, however, persisted in his refusal. In September, the National

Council framed the electoral law which, formally at least, was designed to ensure a secret, democratic vote. On Nov. 12, President Boleslaw Bierut finally signed a decree designating Jan. 19, 1947 as the date for Poland's first general election since the war. The decision had long been held up to permit the Communists and the Socialists, the two principal pillars of the Government, to work out a fair distribution of the parliamentary seats obtained by the four-party coalition sponsoring a single list of candidates at the forthcoming election. Though details of the arrangement were not made public, reports indicated that the Communists and Socialists would each take about 130 seats, and the Peasant party headed by Tadeusz Rek, one of the four men previously expelled from the P.S.L., perhaps 97, with the Democratic party getting an unspecified smaller number of seats.

The coalition slate will be challenged only by Mikolajczyk's P.S.L., for which the government bloc "reserved" about fifty-four seats, considerably less than the 25 percent share which had been previously offered the party in return for joining the countrywide single ticket. All these pre-election deals, of course, did not impress outside observers as foreboding "free and unfettered elections" in the spirit of the Potsdam Agreement.

While it was generally taken for granted that the Government bloc with its monopolistic control of the press, the radio, and especially of the police, would win the forthcoming election, a strong element of incertitude was introduced by the attitude of the Church. After informal talks in September between President Bierut and Cardinal Hlond, Primate of Poland, had failed to lead to agreement, the latter, in a pastoral letter read from pulpits throughout the country on Oct. 20, in effect called upon the faithful to repudiate the Government bloc and vote for the P.S.L. In a direct counter-move, Bierut demanded on Nov. 23 that Catholic priests in Poland "stop using their sermons for political purposes," and asserted that "these attacks from the pulpit form one of the greatest barriers to good relations between the Church and the State."

*Poland in the Soviet Orbit.* Many developments in the course of the year indicated that Poland, under the Government of National Unity, was as solidly anchored in the Soviet sphere of influence as it had been before Mikolajczyk joined the regime. The Warsaw Government engaged, so to speak, in a running diplomatic fight with the Western powers, of which the electoral dispute represented only one phase.

Polish relations with Great Britain, in particular, remained unsatisfactory as the result of a continuous controversy over the fate of the Polish Army-in-exile and related issues.

The long-delayed repatriation of Polish troops in Britain began in February but proceeded very slowly. The large majority of the approximately 200,000 Poles under British military command refused to return home under present conditions, despite formal pledges from Warsaw that they would not be discriminated against. An urgent appeal made by Foreign Secretary Bevin on March 20 ("We are very anxious—extremely anxious—that Polish troops will return to their own country") produced no result. By mid-April, some 180,000 Polish irreconcilables were still left and had to be accommodated somehow. In May the British Government ordered the Polish troops demobilized, but since they were unwilling to return to civilian life they were permitted instead to enlist in a British "Resettlement Corps." The Polish Government immediately protested this move in which it saw

an attempt to incorporate the Poles into the British Army.

The Resettlement Corps was to be concentrated in the United Kingdom and in June the evacuation of the Polish Army in Italy—103,000 officers and men commanded by General Wladyslaw Anders—got under way and was completed by the end of October. General Anders and all Polish officers and men who joined the Resettlement Corps were deprived of their Polish nationality by a decree accusing them of "activities detrimental to the Polish State."

American-Polish relations were disturbed, among many other causes of friction, by the sweeping Polish nationalization decrees which affected American-owned properties estimated at \$100,000,000. In some instances, even the compensation due nationals of friendly countries under the law was withheld on the ground that the assets involved actually belonged to German individuals or firms. On Oct. 18 it was learned that the State Department had filed a formal protest against these practices. A list of 25 firms earmarked for expropriation without compensation, in which American financial interests were involved, was forwarded to the Polish Nationalization Commission which promised new hearings in November.

Both American and British diplomatic and consular officials were involved in a series of incidents in Poland. The most serious of these occurred in November when Mrs. Irena A. Dmochowska, an American citizen and employee of the United States Embassy in Warsaw, was convicted of having attempted to assist the flight from Poland of the alleged murderer of a prominent politician; she was sentenced to five years' imprisonment.

While Poland's relations with the Western powers were marked by growing tension, the bonds tying her to the Soviet orbit were further strengthened during the year. A number of state visits contributed to this result. In March, Marshal Tito of Yugoslavia visited Warsaw and was given a festive reception; a long-term pact of friendship and mutual assistance between the two countries was signed on this occasion. In May, President Bierut, Premier Osobka-Morawski, and Marshal Michal Rola-Zymierski, commander-in-chief of the Polish Army, made a good-will trip to Moscow. In October, the Premier and the Marshal paid a call on the Ukrainian Government at Kiev, and shortly later Bierut and Rola-Zymierski went to Belgrade to repay Tito's visit. All these travels were accompanied by huge demonstrations of mutual friendship and by military parades.

**Anti-Semitism.** Virtually from the first day of liberation from the Nazis, the handful of Jews whom the Gestapo had spared became again the target of vicious assaults by Polish anti-Semites. Sporadic outbreaks and minor pogroms which had taken place throughout 1945 and the early part of 1946 reached a terrible climax in the Kielce Pogrom of July 4, one of the greatest mass slaughters in Polish history. Aroused by a purposely-planted false rumor about Jewish "ritual murders," a Polish mob stormed the apartments of Jews in the city, killing 41 persons. The Government, which had previously endeavored in vain to halt the rising tide of anti-Semitism in the country, blamed the outrages on "Fascist" elements, and in particular on the N.S.Z. In a quick mass trial of the instigators and perpetrators of the crimes, nine defendants were sentenced to death and executed on July 11.

The Kielce Massacre, coming on top of a long series of individual killings of Jews, caused a new Jewish mass exodus from Poland. Thousands fled

westward into occupied Germany, especially the American zone, while other thousands took the "underground railroad" to Palestine, thus adding new complications to a grave international problem. By the end of the year it was estimated that fewer than 70,000 Jews were left in Poland out of the 3,000,000 who lived there before Hitler.

**Death of a Nazi.** Poland's cruel overlord during the years of Nazi occupation, Arthur Greiser, was brought to trial in June before the Supreme National Tribunal at Posen. He was sentenced to death and was hanged on July 21 before a crowd of 15,000 people jamming Posen's Citadel Square. Another top Nazi war criminal, Ludwig Fischer, former Governor of Warsaw, was scheduled for trial late in December.

**Economic Conditions.** Although still one of the hungriest and most poverty-stricken countries in Europe, Poland in 1946 made great strides toward economic recovery. Industrial production progressed steadily, while the farming output lagged, especially in the western territories seized from Germany.

The outstanding fact in the economic picture was Poland's emergence as the leading coal producer and exporter in Europe. With an annual production of coal estimated at 35,000,000 tons toward the end of 1946, and legitimate hopes of achieving a maximum output of 90,000,000 tons by 1950, Poland was eagerly wooed by the commercial attachés of a dozen European nations, which were coal-starved as a result of Britain's inability to export.

Polish finances were held in suspense for months as a result of political complications. In April, credit arrangements aggregating \$90,000,000 were agreed to by the United States, but the funds were held up later by the State Department in connection with the acid diplomatic notes exchanged in the summer. In August, however, the credits were unfrozen, Polish funds in Britain and Canada also were released in the latter part of the year.

**Production.** The first statistical data released by the Provisional Government give an incomplete but nevertheless interesting picture of Poland's economic recovery. The coal output rose steadily in 1945, from 1,355,621 tons in May to 3,114,297 tons in November. During 1946 the average monthly output was about 3,600,000 tons, with an estimated total production of 46,000,000 tons. In the textile industry, the production of wool and cotton fabrics reached 86,400,000 yards. Estimated textile production for 1946 was 227,900,000 yards. Crops were harvested from 5,948,567 hectares. The production of sugar beets in 1946-47 was estimated at 290,000 tons. Poland's prewar livestock was drastically reduced under the German occupation, with only 25 percent of the cattle and 35 percent of the horses left.

**Education.** A school reform introduced by the Provisional Government provides for free, compulsory education for 12 years, including university courses. Poland in 1946 had 21,421 schools with a teaching staff of 61,200, attended by 2,060,000 pupils. Universities have been re-opened at Warsaw, Cracow, Lublin, Poznan, Lodz and Torun.

JOACHIM JOESTEN.

**POLO.** The first American game to be blacked out by the clouds of war came galloping back into the national sports picture last year and from mid-winter, when the big armories began lighting up, until early October, when the curtain fell on the outdoor season, the mallet swingers played to big and enthusiastic crowds.

Westbury's Meadow Brook Club—cradle of the sport—once again was the scene of polo's classics and the season reached a fitting climax on famed International Field with the revival of the international and U.S. open championships. Mexico's popular Gracida brothers—Gabriel, Guillermo, Alejandro and Jose—proved magnets for the major tourneys and also proved they were quick to learn American style of play, for after losing two straight games in the international series they came back to ride away with honors in the open.

Opposing a 34-goal American four of Mike Phipps, Cecil Smith, Stewart Iglehart, and Peter Perkins, Mexico lost by 10-4, before a crowd of 20,000 and by 11-4 before 21,000 in the international series. Smith, with 11 tallies for the two contests, paced the U.S. riders, whose hard-hitting was just too much for the visitors and the President Manuel Avila Camacho Trophy went to Captain Iglehart's team.

However, the Gracidas, riding as the Herradura four, came back nicely two weeks later and carried off the national open title by defeating Phipps' Los Amigos quartet, 11-9, in the final round as 16,000 looked on.

The All-Argentine Miraflores Club, comprised of Fred Vogelius, Torres Zavaleta, Eduardo Brown, and Oscar Tricerri and aided by a 4-goal handicap, annexed the Monty Waterbury Memorial Cup when they defeated California in a thrilling final, 12-10. Del Carroll, Peter Perkins, George Oliver, and J. A. Wigmore rode for the losers. The Miraflores also won the Herbert Bayard Swope Challenge Cup by topping Bob Lightfoot's Meadow Brook Foxhunters, 9-8.

Highlight of the indoor campaign was the national Spring handicap tourney in which the Ramapo Reds routed a West Point Cavalry four, 15-8, in the final. The indoor intercollegiate championship was restored to the schedule, but only two schools could muster teams, and the title went to Army when it conquered Cornell by 16-5.

THOMAS V. HANEY.

**PONAPE.** The main island (158° 10' E. and 6° 45' N.) in the eastern Carolines of the Japanese Pacific Islands. Total area, 145 square miles. Civil population (1938), about 11,468. There is a lagoon around the island formed by an outer reef. Jokai, a fortified islet, 876 feet high, in the lagoon provides the chief harbor landing. A naval establishment and large commercial docks were built by the Japanese. The chief exports are sugar, phosphates, bauxite, alcohol, copra, and dried fish. The island passed under the control of United States armed forces as a result of the Japanese surrender in 1945. On November 6 the United States requested that the island be placed under United Nations trusteeship with the United States as administering authority.

**PORTS AND HARBORS.** Developments in port and harbor development in the United States during the post-war period have been mainly in maintenance and improvement works, coupled in some cases with the conversion of army and navy shipping facilities to commercial use. The numerous and long-continued strikes have hampered much construction work, as well as ship movements and the handling of normal port operation activities. Improvements affecting navigation, such as the deepening and widening of channels, are in the jurisdiction of the Corps of Engineers, U.S. Army (War Department). Other works are in the hands of local public authorities, railway and ship companies, and private concerns.

The River and Harbor Act of November 7, 1945, authorized \$4,614,000 for certain works, and the Act of July 24, 1946, authorized sixty projects estimated to cost \$520,395,000, while the Civil Appropriation Act of August 2, 1946, provided \$110,125,000 for the War Department's civil work in 1947. But the program for construction in 1947 has been cut to \$90,000,000 under the government order curtailing Federal public works not relating directly to the housing problem.

The Port of Boston Authority, which is a new department of the Commonwealth of Massachusetts, plans an ocean terminal costing \$7,700,000 at Charlestown, and improvement work at South Boston. The U.S. Army had established an embarkation terminal on Castle Island, South Boston, and this has now reverted to the Port Authority. The Navy also has released piers which had been occupied for war service. The harbor of Philadelphia was the scene of the sinking and collapse of a private shipping pier, caused it was reported, by the loosening of the soil by high tides, thus weakening the hold of the piles.

The Port of New York Authority is building a pier and grain-conveyor gallery at the Brooklyn docks, as the last steps of a grain storage and shipping terminal, the conveyor loading grain directly to ocean-going vessels moored at a pier 1,250 feet long and 150 feet wide. The new pier is 542 feet long. The elevator has a storage capacity of 1,800,000 bushels, or about half the total grain capacity of the port. The Port Authority has already a railroad union freight station and is building two union freight stations for long-distance motor-truck service. The one in New York City is 1,000 x 175 feet, with freight platform accommodating 144 trucks. The other is at Newark, N.J. (within the port area), 1,150 x 200 ft., and will accommodate 160 trucks. The Port Authority is also building a transfer pier for a car-ferry service to Cuba, railway cars being handled to and from the steamers. A costly accident at the port was the burning of the railway and ferry terminal at St. George, on Staten Island, in June.

At Houston, Texas, new wharf and dock facilities, to cost \$1,150,000, will be completed in 1947. At Long Beach, Calif., a concrete quay 1,400 feet long has been built for the Army. At San Diego, Calif., the Navy is to build a 2,700-foot quay and four piers 1,050 feet long. A sea-plane basin and a new entrance to the harbor are proposed. A novel project at San Francisco, under consideration by both the Army and Navy, is the Reber plan to shut off two arms of the landlocked bay to form fresh-water lakes accessible by locks. At the Mare Island navy yard a large basin is proposed for the storage of a great number of inactive navy ships of all kinds.

At Seattle, Wash., new wharves and other facilities are to be built in view of the development of Pacific traffic. Tacoma is dredging its harbor and using the material to fill tide-lands. Further north, the U.S. Army is establishing a new harbor at Neah Bay, on the Strait of San Juan de Fuca, with a rock breakwater 8,220 ft. long. Everett, Wash., also proposes improvements as a Puget Sound port.

A welded-steel, floating dry-dock for the Navy, launched sidewise into the Ohio River at Pittsburgh, on August 10, is 448 x 97 ft., with sides 45 ft. high and a lifting capacity of 6,000 tons. Another floating dry-dock, built at the Curtis Bay navy yard, in Maryland, is of new design in having steel walls on timber pontoons forming the floor or base, since wood in such location has a longer life

than steel and is less costly to maintain. It is 300 x 84 feet, with a lifting capacity of 3,000 tons, and is intended for the Coast Guard service. At Memphis, Tenn., a large sheltered harbor is planned for the storage of a number of inactive Army vessels.

Mexico has a program for the improvement of Puerto Mexico (on the Gulf) and Salina Cruz (on the Pacific), and is building a road across the Isthmus of Tehuantepec to connect the two ports. Improvements are planned also for Vera Cruz. Brazil plans a general improvement of its large ports, beginning with Rio de Janeiro and the coffee-exporting port of Santos, although the dock facilities at the latter place are owned by private interests. Projects for new docks at Porto Alegre and Pelotas, both in the province of Rio Grande do Sul, are approved by the national government.

In Australia, a dry-dock at Brisbane, Queensland, put in service after war delays, is 830 x 110 feet, in rock excavation. A new deep-sea port at Robe, proposed by the State of South Australia, is 300 miles from the capital city, Adelaide. At Portland, in Victoria, which is 220 miles from Melbourne and has now only an open roadstead, the state government proposes to establish a complete port and harbor. The large ports of the Union of South Africa are being improved for expected post-war developments. The most modern is said to be the combined naval and commercial port of Durban, where extensive improvements include freight handling equipment and land reclamation along the water front, as at Cape Town.

Port works in Europe are largely in the removal of sunken ships and wreckage, preliminary to reconstruction. The adjacent and formerly rival ports of Danzig and Gdynia suffered greatly from bombing and the sinking of ships in the channels, and also from the subsequent removal of cranes and other machinery. Sweden has completed a new west-coast port at Lysekil, and extensive improvements at Gothenberg are planned by the harbor board, with financial assistance from the government. To aid in rehabilitating the war-battered French port of Havre, which has been undertaken by the U.S. Army, three Canadian dredges were towed across the Atlantic. Similar work has progressed at Dunkerque, Marseilles, St. Nazaire, and Nantes.

A secret port at Prince Rupert, British Columbia, was established by the Canadian government in 1942, but was not revealed until 1946. Still another secret war port was established by the British government in South Wales, on account of the crowding of all ports on the Bristol Channel by war and commercial traffic. At Southampton, the marine and railway terminal of the Southern Railway is to be rebuilt on an elaborate scale for passenger and freight traffic. At Dublin, Eire, a dry-dock for vessels up to 18,000 tons is proposed.

Reconstruction of the port of Manila, accomplished by the U.S. Army in record time, was an immense undertaking, owing to the complete destruction during the war. More than 700 sunken vessels had to be removed and wrecked piers and other structures made available pending permanent reconstruction.

E. E. RUSSELL TRATMAN.

**PORTUGAL.** A republic of southwestern Europe. Capital, Lisbon.

**Area and Population.** The area of continental Portugal is 34,254 square miles, and the area of the Azores and the Madeira Islands is 1,236 square miles, or a total of 35,490 square miles. The popu-

lation on June 30, 1944 was 8,043,315. Principal cities are Lisbon, with 800,000 inhabitants; Oporto, 262,309; Funchal, 48,493; Setúbal, 35,071; Braga, 29,875; Evora, 21,851; Ponta Delgada, 21,071; Faro, 20,419; Coimbra, 20,216.

**Government.** Portugal is a corporative state under a constitution adopted in 1933. The organs of government are: a President or Chief of State; a Premier or Chief of Government; a Parliament composed of a corporate Chamber and a National Assembly; a State Council; a Cabinet and the Judiciary. The Chief of State is elected every seven years. Franchise corresponds to literate adult males who pay taxes to the state; to administrative corporations; and to adult females having special secondary school or university degrees. The members of the Corporate Chamber are appointed by local institutions and administrative, moral, cultural, and economic societies. The National Assembly of ninety members is elected for four years by the voters.

In the general elections of 1942, the only candidate was Gen. Antonio Oscar Fragoso de Carmona, who has held office since 1928, and was re-elected for seven years which will expire in 1949. The State Council is formed by the President of the Republic, the President of the Council of Ministers, the Vice President of the National Assembly and Corporate Chamber, the President of the Supreme Court, the Attorney General of the Republic and four other life members. The duties of this council are to advise the President and to convoke or dissolve the National Assembly. The President appoints the Premier who, in turn, elects the Cabinet.

The only legal party is the União Nacional (Party of National Union) which supports the government. The opposition parties refused to participate in the general elections of the National Assembly early in November of 1945, as a sign of protest against the oppressive measures of the Chief of the Government. (See YEAR BOOK 1945, p. 467). The Portuguese Government has been a dictatorship since May 28, 1926, and General Fragoso de Carmona is still dean of European dictators, although he is only a figurehead, for political power has always been in the hands of Antonio de Oliveira Salazar, who was appointed Prime Minister after the military coup d'état that placed Carmona in the Presidency. Salazar was an early imitator of Mussolini's tactics, controlling the most important portfolios, and acting in accordance with the Catholic Church and with the aristocratic élite of the country. There seems to be very little organized opposition against the regime, and the only signs of dissatisfaction have come from groups of the army or the urban labor organizations. On numerous occasions, the workers, grouped in underground unions, have promoted strikes with political objectives, but they have found little backing. Most of the liberal Portuguese are in exile in Paris or London, and the year of 1946 proved to be a more peaceful year for the dictatorship than the previous one.

**Events.** On New Year's Day, Salazar made his customary speech, in which he said that for six years Portugal had been able to celebrate the New Year without the preoccupations and anguish of the war, and he carefully pointed out to the victorious Allied Nations the benefit derived from the neutrality of his country. On February 23, there was an important meeting of the State Council, for the purpose of exchanging ideas concerning the new political situation of the world. In the speech delivered by the President of the Council, he explained that the opponents of the Government did

not participate in the elections of November 1945 because their aim was either regression or revolution, but was not to conform to constitutional means. In discussing certain aspects of international life, the speaker was cautious not to antagonize the United Nations and stated that "Portugal was not yet a member of that organization but that the spirit of men was more important to world peace than the words of a charter or its organs." The President of the Council stated that Portugal was still a member of the League of Nations and was willing to go to Geneva the coming April, to vote for the dissolution of the League and recommend the transfer of its property to the UN. He added: "We have always been loyal to the League, and we shall not fail when the time comes in the last act of its existence." This was undoubtedly an illogical act, because Portugal was voting for the liquidation of a world organization in favor of another one to which she did not belong.

The feeling of the government was that the country was being snubbed by the UN, and the Portuguese press resented that the London Conference had appointed the judges for the International Court of Justice, and hinted that the UN was only "a meeting of the victors, including some who only joined at the last moment." They hoped that the organization would be obliged, after its first meetings, to open its doors and enlarge its membership to the neutral countries. The propaganda of Salazar's government was aimed at reminding England and the U.S. of the collaboration of his administration with the Allied cause. This propaganda was amusing, because Portugal refrained from sending a petition to the Secretariat for an admission to the UN, stating that it was too early to do so, and that she did not care to create a new international difficulty to the world. During the month of February there was a rapprochement in Brazilian and Portuguese relations, caused by the visit of a Brazilian troop ship, *Duque de Caxias*, to Portugal. And the occasion was also used to stress the "collaborating neutrality of the Portuguese government during the war that Brazil won."

On March 3, Cardinal Spellman arrived in Lisbon for a visit of a few hours, and the government profited from the opportunity to emphasize the significance of the visit, and tried to gain the good will of the American Catholics. In the monthly magazine *Portugal*, published by the Ministry of National Information, the editorial gives a detailed account of the Cardinal's visit, as the most important event of the month in the foreign affairs of the nation, giving preference to this visit, in the distribution of their information, over the visit of the British squadron of the Home Fleet which entered the Tagus River on March 22. On this occasion, the government stated that "during the war England was a belligerent and Portugal neutral, but their aims were identical." The Portuguese press carried once more a long and detailed account of the Anglo-Portuguese alliance as the oldest treaty existing in the world. Major Luis Da Camara, in a speech in the National Assembly delivered on March 22, again hinted about the Portuguese dissatisfaction with its exclusion of the UN. He underlined the great importance of the British Commonwealth of Nations—carefully avoiding the word Empire—as a standard type in political organizations of the world, and compared it with the relations between Brazil and Portugal, in which 70,000,000 Portuguese-speaking people lived a common life on either side of the Atlantic, animated by a true spirit of peace. His purpose was undoubtedly to remind the world that Portugal should be

supported by Brazil in its desire to be invited to the United Nations.

In April, the President of the Council made an appeal to the people of Portugal to help in the world food shortage, and promised the British Government that Portugal would contribute to the relief of the European population. That month, the government was greatly interested in the role to be played by the country in connection with the post-war reorganization of the airways in Europe. The airport of Portela was reconditioned and many of the most important companies either received new concessions or were ratified in their former ones. According to Portuguese experts, Lisbon was the air center of the world, as hundreds of people embarked and disembarked daily at Portela, and hundreds of mail bags and bundles were brought in and taken out by plane. This was the result of the foresight of Oliveira Salazar, who had harmonized the interests and objectives of the foreign companies. Among the airlines using the airport as a terminal or transit port are the Pan-American Airways, British South American, British Overseas Airways, Iberia (Spanish), Aero-Portuguesa, A.B. Aero-Transport (Swedish), Sila, Scandinaviska Air Line (Swedish), K.L.M. (Dutch), Sabena (Belgian) and Trans-World Airways (United States).

In May, the Portuguese government commemorated the twentieth anniversary of the military coup d'état that established Salazar in power, and that originated in the city of Braga, when a group of officers led by Gomes d'Acosta took the field against the government. The commemoration of this event, known among the followers of Oliveira's government as the "National Revolution" commenced with the visit of the President of the Republic and the President of the Council to Braga, together with the Ministers of Interior, Finance, War and Navy. The occasion was a display of military strength and medieval pomp. This anniversary was also commemorated in Lisbon, and the Undersecretary of Finance summarized world politics explaining that the European crisis was a result of the war of 1914 and of the second World War. He made a survey of the prevalent political ideas at the end of the war, and mentioned that Russia, Spain and Portugal were experimenting with new political systems; but that the government of Portugal was not totalitarian, because the Parliament is entrusted with the fiscalization of all governmental and administrative activities. He also emphasized that the Portuguese constitution was older than the Atlantic Charter and that while the great powers were still dreaming of imperialism, the Portuguese charter desired only cooperation and solidarity among nations. The speaker did not bother to explain how it happens that Portugal still keeps her colonial empire in Asia and has always stressed the greatness of her colonial policy.

In June, the Portuguese government received from the British the air base of Lages, situated in the Azores, which had been ceded to Great Britain for use during the war. She also received from the United States the air base at the island of Santa Maria, also in the Azores, which had been ceded temporarily to this country. The leading editorial articles of the press mentioned the significance of the event and pointed out that "thanks to these two bases, the Allies were enabled to dominate the Atlantic and deliver the decisive blow to the Axis." They added that upon the shores of the Atlantic, there were three powers imbued with ideas of right and justice, capable of establishing the equilibrium of the Western world.

**Defense.** Military service is compulsory for men

from twenty to forty-eight years of age, who serve for six years in the regular army. The total strength of the army is estimated at 27,000 enlisted men. There are also about 160,000 trained reserves. Besides the regular army, Portuguese youths from seven to twenty years of age receive military preparation in an organization called *Mocidade Portuguesa*, modeled after the Fascist Corps. There is also a voluntary force of 3,400 men, called *Legião Portuguesa*. The Navy consists of 7 sloops, 6 destroyers, 7 gunboats, 3 submarines and a number of auxiliary vessels.

**Economy and Finances.** Agriculture is the leading occupation, followed by fishing, mining, and manufacturing. The trade movement for 1945 was as follows: Imports, 3,902,000,000 escudos. Exports, 3,186,000,000 escudos, showing an unfavorable balance of trade of 816,000,000 escudos. (Nominal value of the escudo was \$0.0412, November 8, 1943). Analysis of the trade movement by classes (in millions of escudos) is as follows: Imports, livestock, 3.0; raw materials, 2,021.0; textiles, 174.3; foodstuffs, 999.0; machinery, 357.5; miscellaneous, 346.9. Exports, livestock, 16.0; raw materials, 644.7; textiles, 715.1; foodstuffs, 1,107.7; machinery, 36.4; miscellaneous, 666.1.

**Colonial Possessions.** The Portuguese Colonial Empire in Africa, Asia, and Oceania consists of:

TABLE OF PORTUGUESE POSSESSIONS IN AFRICA  
ASIA AND OCEANIA

Colonies	Area Sq. Mi.	Population
Possessions in Africa		
Cape Verde Islands (1940) . . .	1,557	181,286
Guinea (1940) . . . . .	13,944	351,089
São Thomé and Príncipe (1940) . .	372	60,490
Angola (1940) . . . . .	481,226	3,738,010
Mozambique (1940) . . . . .	297,654	5,081,266
Possessions in Asia		
In India (1930) . . . . .	1,537	579,970
China Macao etc (1940) . . . . .	6	374,737
Possessions in Oceania:		
Timor (1940) . . . . .	7,330	474,363
Total . . . . .	803,638	10,830,844

According to the Colonial Act of 1930, each Colony has a Governor and enjoys financial and administrative autonomy. Its budget must be approved by the Minister for the Colonies. The natives, and the ownership of land and cultivation are protected by the State, which forbids forced labor.

Portuguese India comprises Goa, Damão and Diu. Chief products are manganese, coconuts, fish, spices, and copra.

The island of Macao, in China, at the mouth of the Canton River, forms a province with two small adjacent islands. The city is divided into two wards, one inhabited by Chinese and the other by non-Chinese, each having its own administrator.

Portuguese Timor consists of the eastern portion of the island of that name in the Malay Archipelago. Principal exports are coffee, sandalwood, copra and wax. (For Portuguese possessions in Africa, see *Portuguese Africa*.)

**Education and Religion.** According to the 1940 census, 67.08 percent of the nation was illiterate, of which 49.03 percent were adults. Compulsory education has been in effect since 1911 and many measures have been introduced to fight illiteracy, although it is obvious that the law is not rigidly enforced. In 1942, there were 10,481 primary schools with 546,790 pupils, 43 secondary schools with 15,344 pupils; 59 technical schools, with 35,492 students, and three universities: Lisbon, with 3,373 students; Oporto, with 1,636 and Coimbra, with 1,611. Freedom of worship exists, but the Roman

Catholic faith prevails and plays an important role in the political, economic and social life of the nation.

**Art and Literature.** In January, the Tenth Exhibition of Modern Art was inaugurated in Lisbon. It included fifty-five canvases, by thirty-three Portuguese painters, with fourteen paintings by eight foreign artists, as well as fourteen sculptures by eleven sculptors. In the same month, a manuscript found in the library at Evora was published, entitled "The Pilgrimage of Andre de Faro to the Land of the Pagans." It described the adventures of Frei Andre de Faro in the interior of Guinea and Sierra Leone in 1663-1664.

In February, Professor Queiroz Velloso published a new, revised and enlarged edition of his book on King D. Sebastião, a work that throws light on the interesting legends of sixteenth-century Portugal. For the first time in the history of Portuguese letters, a woman won the Ricardo Maleiros Prize, awarded by the Academia de Ciencias de Lisboa. The winner was Fernanda de Castro, poetess and novelist, and the book that earned the distinction was "Maria da Lua."

In April, the Secretariado Nacional de Informação published an interesting anthology of Portuguese thought, entitled "Idearium."

MIGUEL JORRÍN.

**PORTUGUESE AFRICA.** This heading comprises five colonies along the west and southeast coasts of the continent. Not included are the Madeira Islands, which administratively are treated as an integral part of Portugal.

**Cape Verde Islands.** An archipelago of some fourteen islands lying off the coast of Senegal, with an area of 1,557 square miles and a population (1940) of 181,286 (the great majority of which are half-castes, with most of the remainder classified as Negroes). The colony is administered by a Governor, who resides at Praia. The islands' economy is rather primitive and figures very little in world trade. The principal products are sisal, castor oil, high-grade coffee, oranges, brandy, and hides. Porto Grande is an important fueling station for shipping on the routes from Europe to South America and Africa.

**Portuguese Guinea.** An enclave of territory bounded on all landward sides by French West Africa, with an area of 13,944 square miles and a population (1940) of 351,089 (of which over 98 percent are Negroes). The climate is quite unsuitable for white settlement. The colony produces some agricultural articles for export, such as palm oil and kernels, hides and peanuts, but its importance lies rather in its position near the bulge of Africa, where Pan American Airways found it convenient before the war to establish landing facilities on its transatlantic route. The seat of Government is at Bissau, which is also the colony's chief port. The former capital Bolama, is among the less important ports.

**São Thomé and Príncipe.** These two volcanic islands, lying in the Gulf of Guinea, are treated administratively as one unit, with a Governor residing in São Thomé. They have an area of 372 square miles and a population (1940) of 60,490 (of which 56,666 were Negroes). São Thomé is by far the larger and more important of the two, and also accounts for about nine-tenths of the total population. Its mountains rise to some 7,000 feet, the soil is fertile and there is abundant rainfall. Despite their small size the islands produce large amounts of cacao, as well as some coffee, copra, and palm oil. There is a considerable movement of

seasonal labor back and forth between the islands and the near-by continent.

**Angola (Portuguese West Africa).** This important colony, largest in the Portuguese empire, has an area of 481,351 square miles and a population (1940) of 3,738,010, of which 44,083 were Europeans and 28,305 half-castes. The Negro population consists largely of Bantu stock still dwelling in a tribal state. The administration of the colony is headed by a Governor-General, assisted by an Advisory Council, the members of which are in part appointive and in part the elected representatives of certain economic organizations of the European inhabitants. Educational opportunities are restricted to less than 100 schools but are gradually improving.

Angola is generally regarded as one of the richer colonies in Africa—it was coveted by both the Nazi and Fascist regimes. Portugal has usually looked to Great Britain to help her defend the territorial integrity of her colonial empire. However, Angola's economic development is still only in the early stages. Among the principal exports are coffee, diamonds, sugar, and palm oil. On the interior plateau, which has a temperate climate, it is hoped eventually to open up large areas to European settlers who will produce cotton, wheat, tobacco, and other exportable items. The principal railroad is the Benguela Railway, which runs from Lobito on the Atlantic Ocean through the Belgian Congo to Northern Rhodesia. The future capital, Nova Lisboa, is located along the plateau section of this railroad line. The present capital is the port city of São Paulo de Loanda, established in 1575.

**Mozambique (Portuguese East Africa).** Mozambique is the most populous of Portugal's possessions, with an area of 297,731 square miles and a population (1940) of 5,081,266—27,438 Europeans, 15,461 half-castes, 9,147 Indians, and 5,027,591 Negroes. The colony is administered by a Governor-General who is assisted by an Executive Council and by a Government Council comprising both officials and representatives elected by certain economic interests. Until 1942 the Companhia de Moçambique administered the territory of Manica and Sofala. Since then the state has been in direct control of the entire colony, which is divided into four provinces: Sul do Save, Manica and Sofala, Zambezia, and Niassa. The capital is at Lourenço Marques. Education is provided by some 700 primary schools, 48 professional schools and one high school.

Mozambique produces very large quantities of sugar, corn, copra, sisal, cattle and other livestock. A great deal of the foreign trade of the Transvaal and its rich Rand mining region passes through the port of Lourenço Marques over the Delagoa Bay Railway. In the same manner, the port of Beira is the outlet, over the Beira Railway, for a considerable part of the foreign trade of the Rhodesias. Beira is also connected by rail with the Nyasaland Protectorate. Along this latter route lies the lower Zambezi Bridge, 12,064 feet in length (said to be the longest bridge in the world). There are 1,330 mi. of railroad in the colony, and 18,000 mi. of roads. During 1943 over 931 ships entered the ports of Beira, Lourenço Marques, and Mozambique. In 1944 total imports were valued at 616,247,000 escudos and exports at 557,977,000 escudos.

**Events.** Early in the year Dr. Marcelo Caetano, Minister of Colonies since 1944, visited Angola and Mozambique. He reported that he was pleased with the social and economic progress being made in those colonies. He took pride in the fact that

there were 50,000 white inhabitants in Angola and 27,500 in Mozambique. For the economic development of Angola, he pointed out, the Portuguese government had procured a loan of 250,000,000 escudos. Similar plans were afoot for Mozambique. In the field of administration, the National Assembly in Lisbon approved amendments to the Colonial Act aimed at achieving greater decentralization, and hence responsibility, for the officials in each colony. Another reform led to the reorganization of the Junta de Investigação Científica Colonial in order that it might provide more scientific data about the colonies and their inhabitants. During the year the Anthropological and Ethnographic Mission of Mozambique entered upon a six-year study of the peoples of that colony.

There was, however, no suggestion from Lisbon that the inhabitants of the colonies be given more political rights or encouraged to prepare themselves for self-government. Outside observers reported that the régime in the Portuguese possessions was thoroughly authoritarian, with freedom of press and assembly denied, no labor unions allowed, and children forced to join the Fascist-type Salazar Legion.

Trade figures showed a marked increase for the transit trade through Portuguese East African ports. This was particularly true of Beira, through which passed much of the foreign trade of Nyasaland and the Rhodesias, and Lourenço Marques, outlet for the Transvaal. Indeed, there was complaint that the rail and port facilities of Mozambique were inadequate to the demands of traffic originating in the Union of South Africa and British Central Africa.

ROBERT GALE WOOLBERT.

**POST OFFICE DEPARTMENT.** The United States Postal Service is the largest agency of Government. In carrying out its functions, it employs an army of 450,000 people, who perform their duties in 41,751 post offices.

Post Office revenues during the fiscal year 1946 were \$1,224,572,173, and there was a financial turnover of more than \$16,000,000,000. There were 36,149,000,000 pieces of mail handled in 1946, an average of approximately 100 million daily. Included in this figure were 19,300,000,000 letters and post cards, 949,000,000 parcels, 5,865,000,000 pieces of newspaper mail, and 6,220,000,000 circulars and advertising matter. In this period, 137,000,000 packages were insured, registry service was given to 97,000,000 pieces of mail, 52,000,000 C.O.D. articles were delivered, and 106,000,000 letters and parcels were sent by special delivery. The total number of money orders issued was 269,829,192 and the amount of money transmitted by this method was \$4,748,066,011.52. There were 27,542,693 postal notes sold, with a value of \$132,242,528.85.

As of June 30, 1946, there were 8,089 Postal Savings depositories. The number of accounts was 4,135,565 and deposits amounted to \$3,119,656,296, an average of \$754.35 for each account. The Philatelic Agency in Washington sold, for stamp collecting purposes, \$3,020,692 worth of stamps. This was the greatest business done by the Agency since it was established in 1921.

During 1946, the Post Office Department devoted much of its efforts toward restoring service to a normal peacetime basis. In many localities, city delivery in business and residential areas, which had been curtailed during the war, was increased. Added facilities were placed in operation in post offices to better serve the public, additional

employees were hired, and many improvements were put into effect or are planned for the future, all designed to render speedier, more efficient mail service.

The return of the railroad and air-line systems to normal operations greatly improved mail transportation in 1946. New and faster train service resulted in a saving of as much as 24 hours on trans-continental mail, and a comparable saving of time in every section of the country.

Additional Highway Post Offices, which were inaugurated in 1941 on routes in Virginia, Indiana, and California, began service in 1946 in Alabama and Michigan. Highway Post Offices serve cities and towns which do not have adequate rail service, or where rail facilities have been discontinued. Continued expansion of this essential form of mail transportation is planned.

Freed of war-time restrictions and priorities, the air lines expanded tremendously in 1946, on both domestic and foreign operations. On October 1 the Post Office Department reduced the domestic air-mail rate from 8 to 5 cents an ounce. This rate now applies to all territories and possessions and wherever the U. S. mail service is in operation, as well as to Canada and Mexico.

Foreign air-mail rates were drastically reduced on November 1. Air-mail rates to South America dropped to 10¢ a half-ounce; to Europe, 15¢; to North Africa, 15¢ and 25¢; to Africa, Asia, East Indies, and South Pacific, 25 cents. Previously, these rates varied from 15¢ to 70¢ a half-ounce.

The Post Office Department in 1946 conducted extensive tests on the carriage of mail by helicopter to determine the practicability of expediting delivery of air mail in large metropolitan areas by this means of transportation. Preliminary figures have shown that much time can be saved in collection and delivery of air mail to localities within such an area. Further tests are planned.

ROBERT E. HANNAGAN.

**POWER, Division of.** A division of the U.S. Department of the Interior which coordinates the power phases of the various bureaus of the department. Director: Arthur E. Goldschmidt.

**PRESBYTERIANS.** A religious connection adhering to a system of church government by presbyters or elders and having some 60,000,000 members throughout the world. In the United States there are ten Presbyterian bodies, the largest of which follow.

**Cumberland Presbyterian Church.** One of the Presbyterian bodies whose chief strength is in the 16 mid-west states. There are a few churches on the west coast. It differs from most Presbyterian denominations on the theological doctrine of fatality. It was organized on February 4, 1810 in Dickson County, Tennessee. There are two presbyteries outside of the United States: Canton in China and Cauca Valley in South America. The 1946 statistical report shows: 1,052 churches; 735 ministers; total membership of 75,427. There was a membership gain over last year of 4,877. The increase in Sunday school enrollment over last year was 4,213. The total valuation of church buildings is \$4,080,960 and manse of \$532,325. The supreme judiciary, the General Assembly, met in Birmingham, Alabama on June 13-17. The 1947 meeting will be Knoxville, Tennessee, June 12-17. Dr. C. R. Matlock, Nashville, Tennessee, is the moderator. Mrs. T. C. Stockton, Memphis, Tennessee, is president of the Board of Foreign Missions. Bethel College, at McKenzie, Tennessee, is the only college and sem-

inary. Wayne Wiman, 117 Eighth Avenue South, Nashville 3, Tennessee, is the Stated Clerk and Treasurer, Financial Agent, and general traveling secretary of the General Assembly. Rev. J. T. Jones, Stevenson, Alabama, is the assistant stated clerk. The Cumberland Presbyterian Publishing House is located in Nashville, Tennessee.

**Presbyterian Church in the United States (South).** The division of the Presbyterian denomination which covers the territory commonly known as the Southern States. It was composed in 1946 of 17 synods (in most cases, corresponding to state lines) and 87 presbyteries, with 3,518 organized churches, 2,621 ministers and 593,418 members, exclusive of ministers. During the year 18,913 members were received on profession of faith, and 28,482 by certificate. There were 11,497 adult baptisms and 9,369 infant baptisms. The ruling elders numbered 19,270, and deacons 22,793. Contributions for current expenses during the year amounted to \$6,576,406, for pastors' salaries \$4,167,886, for building expenses \$4,119,475, and for benevolences \$6,532,586; a grand total of \$21,396,353, an increase over the preceding year of more than \$2,700,000. The total per capita gift was \$36.06, of which \$11.01 was for benevolences and \$25.05 for current expenses.

The 86th General Assembly of the Church convened in Montreat, North Carolina, May 23, 1946, with 378 commissioners present. Rev. J. B. Green, D.D., LL.D., professor in Columbia Theological Seminary, Decatur, Georgia, was elected Moderator. Actions taken by the General Assembly of special interest are as follows: The Committee on Cooperation and Union was directed to present to the next Assembly the final draft of the Plan for Reunion with the Presbyterian Church in the United States of America. A separate Committee on Negro Work was erected and an annual budget of \$100,000 is to be set up. The Committee was directed to elect a Secretary on Negro Work.

A new Department of Christian Relations was opened with a full-time Director. This agency supersedes the Committee on Social and Moral Welfare, which had been in existence for 12 years. The function of the Department on Christian Relations is "to interpret and present Christ's ideal for the individual and for society. . . ." Rev. J. H. Marion, Jr., pastor of Grace-Covenant Presbyterian Church, Richmond, Va., is the secretary and will give all of his time to the work of this new department.

The work of the Permanent Committee on Radio was expanded and provision was made for a full time Director. The Chairman of the Committee, Rev. John M. Alexander, D.D., pastor of the First Presbyterian Church, Fayetteville, North Carolina, accepted this post and opened an office in Atlanta, Georgia. The Radio Committee and the Department of Men's Work carry on this work in cooperation with the Southern Religious Radio Conference, which was organized by the Baptists, Methodists, and Presbyterians in 1945. Live-voice broadcasts are made weekly according to a schedule which divides the year among these three groups.

Most of the 270 ministers who served as Chaplains in the Armed Forces have been released and are back in pastorates. A few will continue with the Veterans' Administration in hospitals.

Plans are being made for the rehabilitation of the Foreign Mission work in the Orient. Surveys are being made by representatives of the Executive Committee of Foreign Missions and by Missionaries themselves, who have returned to the Orient after an enforced residence in the home land.

Training of recruits for the Ministry and Lay service is conducted in the four Theological Seminaries and the Training School for Lay Workers. Thirteen colleges controlled by synods and two affiliated colleges provide a Christian education for young men and women, who will be the future leaders of the Church. Seven Junior Colleges, eight secondary schools and three mission schools (one for Indians and two for Mexicans) continue to render splendid service. Sixteen Orphans' Homes and Schools take care of the bodily, mental and spiritual needs of more than 1,600 children.

The 1947 meeting of the General Assembly will convene in Montreat, North Carolina on May 29.

**United Presbyterian Church of North America.** A member of the family of Presbyterian Churches, of Secession and Covenant origin, formed by the union in Pittsburgh, Pennsylvania, May 26, 1858, of the Associate and Associate Reformed Churches. The General Assembly of the Church convened in Sterling College, Sterling, Kansas, May 29, 1946. The membership of the church is 198,815 in America and 68,992 in Egypt and India. The contributions in America averaged \$36.41 per member for the year. The Moderator of the General Assembly is Rev. Lytle Rodgers Free, D.D., Philadelphia, Pennsylvania. The Clerk of the General Assembly is Rev. O. H. Milligan, D.D., LL.D., Pittsburgh 2, Pennsylvania.

**PRICE ADMINISTRATION, Office of (OPA).** Rapidly changing conditions confronted the Office of Price Administration during 1946 as it continued to carry out the purpose of the Emergency Price Control Act of 1942 "to stabilize prices and to prevent speculative, unwarranted, and abnormal increases in prices and rents." Adaptation of pricing policies to facilitate the transition from war to a peacetime economy, liberalization of the use of wage increases as a basis for price adjustments, and removal of price ceilings from an increasing number of commodities marked the first half of the year. Price controls then ended temporarily upon the expiration of the act on June 30 and a presidential veto of an extension act that he deemed unworkable. A greatly weakened bill finally became law on July 25. It placed emphasis on decontrol, specifically exempted certain commodities from control, and required increases in ceiling prices of many other items. Following a period of confusion in which scarcities developed as goods were withheld from the market in anticipation of the ending of controls, meat was removed from price control by presidential direction on October 14 and the lifting of other controls was ordered accelerated. With so much of the economy freed from price controls, the problems of distortions in production and diversion of goods increased greatly. As a result, the President, on November 10, ordered removal of remaining price controls except those necessary to implement the rationing and allocation programs of sugar and rice. Control over residential rents was continued. An Executive Order on December 12 lodged the remaining functions of OPA, together with certain other wartime responsibilities, in the Office of Temporary Controls.

OPA's ability to maintain price stability became progressively more difficult during the year. As 1946 opened, pent-up consumer demand for goods was unsatisfied since incomes continued relatively high and supplies of consumer goods, particularly durables, such as refrigerators, automobiles etc., remained scarce. Production was hampered by labor-management difficulties; arrival of goods on retail shelves was further delayed by the need to fill dis-

tribution pipe-lines and to build distributor inventories. Consumer irritations resulting from these delays furthered a campaign in some quarters to end price controls, as the Congress held extensive hearings and debated approximately five months the need for extending controls. Almost concurrently, OPA was making an increasing number of price adjustments, where necessary, to increase supplies of needed civilian items, to conform to the new wage-price policy, or for other reasons. A total of 649 industry-wide and 12,530 individual company adjustments were made during the first six months of 1946. Despite these price increases, the overall record of price stability as measured by indexes of the Department of Labor was relatively favorable. Consumers' prices advanced 2.6 percent and wholesale prices 5.4 percent from December to June 1946. During the second half of the year, the rise was far more rapid, consumers' prices advancing 15 percent and wholesale prices 24 percent. This sharp rise left the consumer index in December 1946, 55.5 percent higher than August 1939, as compared with 31.7 percent at the close of 1945.

The lapse in price controls from June 30 until July 25 stimulated the sharp rise, which OPA found difficult to stem under the terms of the weakened extension act. Although June 30 ceilings were immediately restored to many items, price increases had to be granted promptly to conform with the provisions of the new act, especially because of the requirement that ceiling prices for distributors must reflect average current costs of acquisition plus the average percentage markup in effect March 31, 1946. Previously, OPA had required distributors to absorb all or part of increases allowed to producers. The new statute also reduced the use of government subsidies which had contributed substantially to price stability since May 1943, transferred to the Secretary of Agriculture the decision as to continuance of control over prices of agricultural commodities, ordered immediate decontrol of specified commodities, established methods for hastening decontrol, and provided for a Price Decontrol Board with final authority to decontrol and reconrol prices.

Food prices were most sensitive to the changed situation and rose 30 percent at retail and 40 percent at wholesale during the last half of 1946. Prices of meat and livestock advanced even more sharply. As agitation for removal of controls increased during the second quarter of 1946, withholdings of livestock and meat from market developed. With the lapse of controls, meats shot up nearly 70 percent and livestock more than 20 percent. Partial price declines followed as more livestock came to market and consumer resistance to the higher prices developed. But when the legislation to extend OPA specifically exempted meat from control, at least until August 21, wholesale meat prices once more advanced on the average by almost 90 percent. Decision of the Price Decontrol Board late in August to restore ceilings on meat and livestock led to another spurt of marketings. When price ceilings on meat once more came into effect in September, the nation was confronted with an almost complete disappearance of meat. Rapid marketing of underfed cattle had depleted the feedlots, but organized agitation for removal of price control of meats stimulated widespread withholding of available supplies in the anticipation of higher prices. Price rises of 12 percent at wholesale and 14 percent at retail over June 30 levels allowed at the direction of the Secretary of Agriculture when meat ceilings were restored failed to attract meat to market. When the meat

shortage became so acute as a result of the campaign against meat controls, the President on October 14 directed the lifting of all controls on meat. Prices on meat once more rose abruptly, wholesale meat prices increasing 93 percent during the first week of freedom from controls. By the close of the year wholesale prices for this product were 40 percent above the last controlled prices and 65 percent above the ceilings that had prevailed in June.

The President had directed that removal of other controls be speeded. Most food products had been decontrolled by the end of October and OPA removed ceilings from many other commodities to an extent compatible with economic security. Withholding of controlled goods in the expectation of decontrol then became so serious as to threaten key segments of the economy with paralysis. Consequently on November 10, the President directed removal of other price controls except those over residential rents, sugar, and rice.

Rent control continued throughout 1946 as one of the most successful stabilization programs. Except for individual adjustments of rents, the average level of rents for the nation as a whole remained practically stable, the overall rise over August 1939 being limited to only 4.3 percent.

Sugar was the only commodity still under rationing controls throughout 1946.

Enforcement of price control was a pressing problem during 1946 in the atmosphere of pressures for decontrol and after the brief return to the free market in July. OPA, nevertheless, bent every effort to investigate and prosecute violations. It made an intensive attack on the meat black market and on illegal lumber and building materials transactions. Enforcement activities were continued in the fields in which controls were continued and violations which had taken place prior to the ending of other controls were prosecuted under the provisions of the Price Control Act.

MAX McCULLOUGH.

**PRISONS, PAROLE AND CRIME CONTROL.** The past year, the first in seven which has seen no open warfare, was marked at the outset by dire warnings of the crime wave that was to be unloosed on America with the demobilization of millions of men and the return of the country to a complete peace-time economy. These expectations, like those of unemployment and slow peace-time reconversion, did not materialize. The States and the Federal Government, nevertheless, did not find themselves unprepared: plans had been drawn up for the modernization of old institutions and the building of new ones, and many of these would now be built, were it not that housing and other construction took priority of materials and labor. It is to be expected that should a recession from the present high level of employment occur, that plans can go forward at once to replace many outmoded structures and to build modern ones in which more enlightened procedures and methods may be introduced.

The final demolition, in December 1945, of the old cell block at Sing Sing, which had been built one hundred twenty years ago, is but one sign of the times. The disappearance of this structure, in use until 1943, and condemned annually since 1916, like the abandonment of the Tombs in New York City, is another indication that the hold of yesterday's penology on today's prison thinking and methods is finally being loosed.

Not only in buildings, but in thinking about their effectiveness, has the first post-war year been

marked. It is fair to report that there is a new critical spirit to be seen in the prison field: men coming back from the service to their former positions in the field are carrying with them some of that impatience which gave such good results in the war effort. The coming years should see the working out into practice of many of the forms of treatment—greater variety of extramural programs, a wider use of probation, some experimentation with such devices as hostels, forestry camps, greater pre-release privileges for the man who is shortly to be returned to the community—which are today being discussed.

**Prison Population Trends.** The population of state and federal prisons and reformatories decreased from 165,585 in 1940 to 127,076 in 1944, a decrease of 23 percent. From 1944 to 1945 the inmate population had increased by only 795, but there are indications since, that the substantial increase in prison commitments which has been predicted for the postwar period may soon materialize. From September 30, 1945 to September 30, 1946 there was an increase of 6 percent in the population of state institutions: there has been no such increase in federal prisons despite the fact that about a thousand prisoners were transferred from the armed forces. The population of federal institutions stood at 18,170 at the end of September 1946 as compared with 18,962 in September 1945. This slight decrease can be accounted for partially by the release of violators of special wartime laws (particularly the Selective Training and Service Act) of whom more than eleven thousand have been committed since 1940. In December 1946 less than 1,500 remained in confinement. Of these 455 were Jehovah's witnesses and less than 50 were conscientious objectors.

This latter group petitioned during the year for release of selective service violators and specifically for amnesty for those with religious objections. By means of hunger fasts, picket lines and even sit-down strikes they brought their plea to public attention, but to date no amnesty has been issued.

**Escapes and Riots.** Two convicted murderers, who cut their way out of the Washington, D.C. jail with a can opener, dramatized for the residents of that area the insecurity and general loose methods which marked the administration of penal and correctional institutions in the nation's capital. After a Congressional investigation and the passage of several laws clarifying the status of correctional institutions in the governmental set-up, a new director of corrections was appointed directly from the federal prison service. A committee to continue the investigation so inauspiciously begun is now at work, motivated by the desire to see the penal and correctional institutions in the District of Columbia set the example for the rest of the country in these matters.

The most dramatic escape attempt in United States prison history occurred in early May at Alcatraz. No prisoners escaped but two officers lost their lives and seventeen others were injured. The revolt was engineered by six of the most dangerous and desperate of the institution's intractable inmates, led by a former bank robber and dishonorably discharged soldier serving a twenty-five year sentence. The escape plot was frustrated at the outset because the prisoners could not obtain the keys to the door leading to the outside yard, but they nevertheless refused to give up their arms and surrender. Thus the mass escape attempt became a revolt, and a gun battle between inmates inside and prison officers and law enforcement authorities outside ensued. This ended by the surrender of the

prisoners after nearly two days of serious rioting. Three prisoners were killed and a number were injured. Among progressive prison administrators the "Battle of Alcatraz" has not altered the basic philosophy of hope and rehabilitation. While some prisoners are desperate and ruthless men who will stop at nothing, not even murder, this small group will not be permitted to impair or handicap programs now in effect for rehabilitating the more hopeful offenders.

**State Penal Developments.** The States of Florida, Oregon, West Virginia, Louisiana, Washington, and Ohio made considerable progress in the evaluation of their entire penal program. Florida will have a new women's institution and a new reformatory, it is hoped, as a result of this survey, and West Virginia bids fair to reorganize entirely its system of institutions and county jails.

California, after five years' experience with the Youth Correction Authority Act, paused to appraise the effectiveness of its operation and to plan for further implementation of the provisions of this legislation. The Youth Correction Authority Act idea is the most hopeful forward step that has been taken in American criminal justice in the past decade. Of the many states which have in recent years looked into the provisions of this Act, Minnesota is among the most recent.

The Federal Corrections Act was again introduced with the hope that its passage would give prison administrators a greater opportunity to plan for the rehabilitation of the men entrusted to their care without the restrictions now imposed by the fixed sentences under which men are committed to federal custody. It was only fifteen years ago that Congress enacted a bill under the provisions of which the judges, instead of committing directly to one institution, sentenced men generally to the custody of the Attorney General. At first this act met with considerable opposition from some of the judges but this statute is now generally accepted and approved. Under it, sentenced prisoners are not sent to an institution by the court until their previous background has been studied and appraised and an estimate has been made of their likely response to one of the twenty-seven institutions under the supervision of the Department of Justice. After further observation, the classification committee at the institution decides whether their needs would not be better served by transfer to another institution.

This same flexibility is the core of the English Criminal Justice Bill, originally introduced in Parliament in 1939. Postponed because of the war, this bill will again be brought up for consideration as soon as some of the more important Labor Party proposals have been disposed of. American students and practitioners in the criminal justice field will await with interest the results of this monumental new effort to integrate and rationalize the sentencing, treatment and release of persons convicted of crime.

Incidentally, while much has been made of the increasing number of young people arrested for crime in America, it is interesting to note that the City of London reports that last year over one-half of all arrests were made on persons under 21 years of age. This group accounted for more than 41 percent of all arrests for larceny and more than 60 percent of the arrests for motor vehicle theft. From New Zealand comes word that the percentage of sentenced prisoners under the age of 21 has approximately doubled over the prewar proportion.

**War-Time Contributions of Prisoners.** Before their contribution to the war passes into history, it may

be well to summarize just what prisoners did for victory. According to a 1944 estimate by Army personnel procurement authorities, over 100,000 classed as felons, that is, men who had received a sentence of longer than a year, were inducted into the Army. This figure does not include those who might have gone into other branches of the service, nor those who were accepted after this date. Nevertheless, it is heartening to realize that so great has been the change in the public attitude toward men with criminal records, that upwards of seven full-strength divisions can be considered to have been drawn from the ranks of the convicted. It is indeed to be hoped that the Army, in altering a precedent which had stood since 1878, will not allow the termination of hostilities to deter it from this present enlightened course.

In prison work shops all over the country, men serving sentences, many of them working overtime, produced a total of 136 million dollars worth of war goods. This figure, through the end of 1945, includes 57 millions from state prisons and reformatories and 79 millions from federal penal and correctional institutions. Farm produce and articles for peace-time consumption are excluded from this sum.

Additionally, prisoners all over the country responded wholeheartedly to calls for bond purchases and for donations of blood plasma which went directly to the fighting fronts. Men behind prison bars offered themselves for experimental purposes, and made important contributions, as a result, to studies in the use of animal plasma for transfusion purposes, to studies of malaria and other wartime diseases. Some lost their lives in the course of these experiments, and were granted posthumous pardons.

Preliminary studies made in Illinois, New Jersey, New York, and by the Federal Government lead to the conclusion that men with prior criminal records averaged about the same as those inducted from the ordinary population. The percentage of those former prisoners who won advancement and special awards paralleled the all-over figure for all soldiers and sailors, while the proportion of those who were court-martialed and got into trouble otherwise does not seem to have exceeded the average. It is to be hoped that more precise studies at a later date may be made in order that these figures may be verified. The fine spirit displayed by these men at a time of extreme national emergency has led leaders in the field of penology to wonder whether more may not be done in peacetime to give sentenced prisoners an opportunity to work for the national interest, in the course of their sentences, for injury done to the State.

The end of the year 1946 also saw the discontinuance of the special selective service panel boards which had been set up in prisons and reformatories throughout the country in 1942. These panels, acting like any neighborhood selective service board, registered, classified, and readied for induction men who, despite their criminal records, were considered by induction authorities to be worthy potential members of the armed forces.

**Juvenile Delinquency.** The office of the Attorney General has in recent years provided leadership in the field of crime control. Under Attorney General Mitchell, the Wickersham Commission explored the phenomenon of gangsterism and laid the foundations of a policy which resulted in the reduction of that menace to civil order. Homer Cummings in 1934 called a conference to review the general picture of crime in the United States, and measures to be taken to meet it. Mr. Frank Murphy, as At-

torney General in 1939, called the Conference on Release Procedures at a time when parole had fallen into disrepute because of attacks launched against it in high places.

It is quite in the order of things, therefore, for Mr. Clark to have issued a country-wide call to a Conference for the Prevention and Control of Juvenile Delinquency. Meeting in Washington from November 20-23, the Conference has for the first time made a well-rounded national presentation of the factors conducive to the development of delinquent careers and the measures which should be taken to correct them. It was the expressed intent of the delegates to pursue the problem further with regional and local conferences which will take up from where the national conference left off. The proceedings of the conference are awaited with great interest and may well prove to be the most important contribution to date to the literature in this field.

The indivisibility of the entire field of crime control is emphasized by the calling of this national assembly to consider the more effective prevention and treatment of criminal conduct. The conviction grows that the various local and state jurisdictions must integrate their programs on a national basis: recent mobility of our population has demonstrated that state lines are no barrier to criminal behavior; that the state which does not effectively prevent crime or treat the offender within its borders has no sure guarantee that its laxity may not be matched by the indifference of another state. The boundaries of crime are national and not state-wide, and we may expect that the coming year will see many signs of the acceptance of this fact.

**The County Jail.** The local jail is a perennial topic of discussion and appraisal, and rightly so, because of the fundamental part which the county jail plays in the total picture of crime control and treatment. Like the local court, the largest proportion of offenders pass through the local jail and their penal experience goes no further. All accused awaiting trial who cannot make bond, some witnesses, many children, and too many alcoholics and prostitutes for whom no other form of treatment has been devised know the inside of the local jail.

Since the Federal Bureau of Prisons boards an average of between three and four thousand prisoners annually in non-federal jails, it has for many years maintained an inspection service for the purpose of approving those which come up to its standards and refusing to contract for the boarding of federal prisoners in those which fall too far below it. Up to the end of the year only 444 of the 3,127 county and city jails inspected since 1930 were fully approved for federal use. This constitutes only 14 percent, and of these, four-fifths rated less than 60 percent on the scale used to appraise such matters as food, cleanliness, supervision, and safety. Eighty-two percent of the jails inspected in the past sixteen years rated less than 50 percent on this scale; only 2 percent rated 70 percent or above.

The condition of our jails generally in the year following the close of World War II provides little basis for optimism. Only 30 percent of the jails inspected this year appeared to have improved as compared with prior inspections, while 47 percent appeared to be worse. The conclusion is inevitable that most local jails—institutions which lie completely within the administrative domain of sheriffs or other locally elected officials—continue to constitute a disgrace to our democracy. Deplorable jail conditions must be attributed in part to the indifference of the local citizenry where such conditions are allowed to continue. In this regard it is hoped

that the recent wave of public interest and indignation following upon a series of articles in two popular magazines will go far to awaken the ordinary citizen to his responsibility in this connection. Until this public concern is reflected in standards far above what are commonly accepted by our communities, the jail will continue to be a national disgrace and a source of corruption at the very root of crime control, largely undoing all that may be attempted in the way either of crime prevention or of decent and humane treatment at the prison level.

**Army and Navy Correctional Programs.** The two branches of the service continued to make progress in the field of enlightened treatment and rehabilitation of the offender in uniform. The number of men in Army custody dropped from the previous year's high of 35,800 to 13,900, while comparable Navy figures show a reduction from 16,100 to 8,800, of whom 1,400 were awaiting trial, the remainder being under sentence. These figures do not include a total of 3,913 in custody of the Federal Bureau of Prisons, by transfer from military or naval installations. These long-term or serious offenders comprise 3,862 committed by the Army and 51 from the Navy.

Army and Navy correctional programs, staffed during the war by career persons drawn from civilian agencies, while now manned by regular Army and Navy personnel, nevertheless continue the high standards and the progressive programs initiated during the war years. The War Department has restored to active duty more than 24,000 court martial prisoners. The Special Clemency Boards set up by the Under Secretary of War reported they had reviewed a total of 28,400 sentences. With the completion of this work, all men still serving court martial sentences will have their cases reviewed annually. It is estimated that by 1950 less than 1,500 of these military offenders will continue in custody.

In December 1946 the Army opened its newest disciplinary installation at Camp Cooke, California. This institution, patterned after the Federal Penitentiary at Terre Haute, Indiana, and under the command of Col. J. W. Fraser, who formerly headed the War Department Correction Division, will, it is hoped, ultimately supplant the old military prison at Fort Leavenworth which is long out-moded.

The Navy announced a change in the names of its Naval Prisons at Portsmouth, New Hampshire, and Terminal Island, California, to Naval Disciplinary Barracks, in line with the rehabilitation being carried out at those two institutions. The War Department, in adopting a policy of parole supervision for men discharged before full expiration of sentence, gave a further indication of its acceptance of modern correctional standards, and integrated its program of treatment. Federal probation officers are expected to supervise Army parolees, as they now do parolees from federal penal and correctional institutions.

**International Penal Affairs.** The chief development of note in this field was the revival of interest in the International Penal and Penitentiary Commission, with headquarters at Berne, Switzerland. This Commission was originally established through the efforts of an American penologist, Dr. Enoch Wines, in 1870, and it is therefore fitting that an American, Sanford Bates, of New Jersey, now leads the organization as it heads into a period of constructive post-war activity. The Economic and Social Council took note of international penal affairs when it charged the newly created Social Commission to undertake, as one of its functions, responsi-

bility for the development of an international program for the prevention and treatment of crime and criminals. The precise place of the International Penal and Penitentiary Commission under the United Nations is not yet determined as this is written, but there is ample assurance that some machinery will be developed which will make possible an interchange of ideas, information and personnel among United Nations members as to progressive developments in the field.

The influence of the American viewpoint on penal affairs in occupied Germany and Japan seems to be growing. The Allied Control Commission for Germany accepted a set of basic penological principles to govern the administration of German prisons which was prepared by the American representative. These principles provided for more liberal treatment than characterizes the Continental systems. It abolishes, for instance, corporal punishment and enunciates the principle that prisoners should be permitted a certain amount of group recreation and exercise, contrary not only to the system prevailing in Nazi Germany, but in some other European countries as well. The prisons of Japan are likewise under the supervision of an American penologist who is modernizing these institutions and bringing their methods in line with the program and philosophies of the Western nations.

JAMES V. BENNETT.

**PROCUREMENT DIVISION.** A Division of the U.S. Department of the Treasury which procures supplies and services for the Government and controls the disposition of government property, exclusive of realty. In addition to its usual peacetime activities, the Division now maintains and replenishes stocks of strategic and critical materials, buys products for Lend-Lease and for relief distribution through the Red Cross. Federal Business Associations located in the larger centers of the United States function as agencies of the Procurement Division to promote cooperation among the local federal activities with the object of effecting economies and increasing efficiency in the transaction of routine business of the Government, as well as assisting in various projects of the Procurement Division as requested. A Price Adjustment Board renegotiated war contracts consummated by the Procurement Division. Director of Procurement: Clifton E. Mack.

**PRODUCTION AND MARKETING ADMINISTRATION:** An agency of the U.S. Department of Agriculture, created Aug. 18, 1945, which consolidated several existing agencies. It consists of 10 commodity branches, 8 functional branches, a Field Service branch, 4 staff offices, the Commodity Credit Corporation, and the Federal Crop Insurance Corporation. One commodity branch exists for each of the following: cotton, dairy products, fruits and vegetables, grain, livestock, poultry, special commodities, sugar, and tobacco. Each branch is responsible, with respect to the commodities over which it has jurisdiction, for production, adjustment, purchases, subsidies, loans, processing, price support, and distribution. It may establish programs to effect economies in processing and marketing of food. It may cooperate with industry and other agencies of the Department in developing new or substitute products. It supervises market news services and maintains standards by means of inspection and grading. Administrator: Jesse B. Gilmer (acting).

**PROTECTION AND SALVAGE OF ARTISTIC AND HISTORIC MONUMENTS IN WAR AREAS,** American Commission for. A Commission announced by the U.S. Secre-

tary of State, Aug. 20, 1943, which functions in conjunction with the War Department, State Department, and other government agencies, as well as with various museums, universities, and scholars, for the conservation of works of art and monuments in war areas. It is also charged with the duty of urging the restitution of works of art and archives appropriated by the Axis powers or individuals acting under their authority or consent. The Commission cooperates with similar committees of other countries, or of the United Nations, in furtherance of those objectives. Chairman: Justice Owen J. Roberts.

**PROTESTANT EPISCOPAL CHURCH.** The fifty-fifth General Convention of the Episcopal Church meeting in Philadelphia, September 10-20, gave unmistakable evidence of the Church's concern for its world-wide mission. Not only did the Convention adopt a missionary program and budget larger than that proposed by the National Council, but in a movement begun and vigorously carried forward by laymen in the House of Deputies, enthusiastically instructed the National Council to raise at least a million dollars in each of the next three years for world relief. This action was concrete evidence of the Church's living belief that Christ's body is one, though at present having many members. When one Member suffers, all the Members suffer. The extension of Christ's Kingdom, and the continuation of Christian civilization depend upon the revival of the life and work of Christian Churches everywhere, and especially in Europe and Asia, laid low by war destruction.

This assistance will be a tremendous power for a Christian peace. But Convention went a step further and in unmistakable language recorded its belief in the United Nations as "the only established agency through which the peoples of the world can at this time pursue the establishment of world law" and declared "its conviction that peace among peoples and between nations can be maintained only under law which involves a representative legislative body, elected by the people of the constituent nations, whose laws shall be addressed to the citizens individually, interpreted by the people's courts, and in force by an executive answerable to the people."

Other important actions included: the election of the Rt. Rev. Henry Knox Sherrill of Massachusetts as Presiding Bishop, to succeed the Rt. Rev. Henry St. George Tucker, who retired because of age; the election of Justice Owen J. Roberts as president of the House of Deputies, and the Rev. C. Rankin Barnes as secretary, to succeed the Rev. Franklin J. Clark, whose 27 years of service were recognized in a resolution of appreciation; the voting to seat Mrs. Randolph Dyer of Missouri as a deputy without prejudice to future action on the subject of women as deputies. Mrs. Dyer became the first woman ever to sit as a deputy.

It adopted a budget for 1947 of \$3,386,887, with increases to \$3,560,000 for 1948 and \$3,910,000 for 1949. This represents substantial increases over the past triennium of which some of the most significant were: for salary increases to workers in the foreign field, \$50,000; for salary increases in the domestic field, \$18,080; for the new Chinese missionary district of Yun Kwei, \$20,000; in addition to the \$17,150 proposed by the National Council for rural work, \$60,000. There were also increases for work in Japan, the Philippines, the Canal Zone (for new work in Central America), American Churches in Europe (providing for a full-time bishop), and youth work.

There was approval of the establishment of an Episcopal Film and Radio Commission under the Department of Promotion. It requested the Lambeth Conference, meeting in 1948, to give attention to ways of closer cooperation and coordination in the missionary work of the Anglican Communion. It accepted the transfer of work in Nicaragua, Costa Rica, and the Republic of Panama from the British Diocese of Honduras. It substituted for the resolutions to study the Proposed Basis of Union (advocated by the majority of the Commission) a proposal supported by the minority members giving the Commission a new directive for negotiations with the Presbyterians and other Christian bodies. The resolutions called upon the Commission to draw up a statement, based on the Lambeth Quadrilateral, of the conditions on which the Episcopal Church will enter into "intercommunion," looking forward to ultimate "organic federation"; and ask the Presbyterians to prepare a similar statement. The phrase, "organic union," hitherto interpreted as requiring amalgamation of dioceses with presbyteries, and General Convention with General Assembly, is omitted from the resolutions as adopted. Approved membership of the Episcopal Church in the National Council of Christian Churches in the USA, overall interchurch agency combining the Federal Council with various other agencies.

Greetings were exchanged with the Patriarch of Constantinople, the Greek Church, the Serbian Church in America, the Japanese Church, the Archbishop of Canterbury, the Archbishop of the West Indies, and two Chinese Bishops were welcomed to the sessions of Convention. A place for Polish Old Catholic bishops as brother bishops in procession at opening service was prepared.

It adopted a revised marriage canon eliminating the Church's one ground for divorce—adultery—and increasing the impediments to marriage to include fraud, coercion, duress, "such defects of personality as to make competent or free consent impossible," and "concurrent contract inconsistent with the contract constituting canonical marriage." It provided for a finding that "no marriage as the same is recognized by this Church exists" if one of these or the former impediments is found to be present in a marriage which has been dissolved or annulled by civil court.

Initial action (subject to final passage in 1949) on providing a suffragan bishop to have charge of the Church's work in the armed forces was taken. By canonical action the acceptance of the retirement of all bishops at age 72 was made mandatory.

Resignations were accepted from: James deWolf Perry as Bishop of Rhode Island, Arthur W. Molten as Missionary Bishop of Utah, who will be succeeded by the Rev. Stephen C. Clark; Harry T. Moore, Bishop of Dallas who was succeeded on October 4 by his coadjutor, C. Avery Mason; Charles S. Reifsnider, James Maxim, who will be succeeded by his coadjutor Edmund P. Dandridge; William T. Manning, S. Arthur Huston as Bishop of Olympia; Cameron J. Davis as Bishop of Western New York; Charles B. Colemore as Missionary Bishop of Puerto Rico who will be succeeded on March 31, 1947 by his coadjutor, Charles F. Boynton; John C. White as Bishop of Springfield. The resignation of the Rt. Rev. Donald B. Aldrich as coadjutor of Michigan on account of ill health was also accepted.

The reunion of Missionary District of Western Nebraska with Diocese of Nebraska was approved. The Reconstruction and Advance Fund presented at the opening service of General Convention amounted to \$7,057,919. The Triennial United

Thank Offering of the women of the Church totaled \$1,631,576.21.

The next General Convention will be held in San Francisco in the Autumn of 1949, which year marks the 400th anniversary of the English Prayer Book.

The headquarters of the National Council, which is also the board of directors of the Domestic and Foreign Missionary Society, are in the Church Missions House, 281 Fourth Avenue, New York 10, New York. The official magazine is *Forth*, William E. Leidt, editor. The President of the National Council is the Rt. Rev. Henry Knox Sherrill, Bishop of Massachusetts.

**PSYCHIATRY. War Effects.** The full toll of war, in its effects upon the minds of men under stress of combat, has for the first time been revealed in a report by Appel and Beebe (*Jour. Am. Med. Assn.* Aug. 31, 1946), both of the Office of the Surgeon General, U.S. Army. This report, called by Brig.-Gen'l. Wm. C. Menninger "without doubt one of the most important psychiatric documents in this war," was based on field studies in Italy by the senior author during the heaviest fighting of the Fifth Army during the break through to Rome and on to the Arno line.

The psychiatry of combat is summed up in "the simple fact that the danger of being killed or maimed imposes a strain so great that it causes men to break down. . . . There is no such thing as 'getting used to combat.' . . . Men will break down in direct relation to the intensity and duration of their exposure. . . . Psychiatric casualties are as inevitable as gunshot and shrapnel wounds in warfare." In the North African Theater "practically all men in rifle battalions who were not otherwise disabled ultimately became psychiatric casualties." The average point at which the soldier became ineffective lay between 200 and 240 aggregate combat days (10 combat days are equivalent to 17 calendar days). It was the consensus of medical and line officers that "a man reached his peak of effectiveness in the first 90 days of combat," after which his efficiency steadily declined until finally he was useless, in most cases after 180 or even 140 days.

The British estimated that the endurance of their riflemen in Italy was about twice that of the Americans, owing to the fact that their infantrymen were withdrawn from the line after 12 days or less for a 4 days' rest, whereas the American soldier was kept in the line from 20 to 40, occasionally even 80 days without relief. The lesson is obvious. The net result was that in the rifle battalions in Italy only about 7 percent of the men held out for 210 aggregate combat days.

This wartime experience offers a lead in preventive psychiatry in civilian life in the regulation of stressful environmental conditions of whatever kind, particularly in industry, as a means for promoting the mental health of the population.

Appel, Beebe, and Hilger (*Am. J. Psychiat.*, Sept. 1946) make a significant comparison of the incidence of psychiatric casualties in World War I and World War II. They report that while available data do not permit strictly accurate comparison, casualties of this type were for obvious reasons much more numerous in the recent conflict than in the war of 1914-1918. They estimate about 140 per thousand men per year in the A.E.F. in World War I and 260 for combat divisions in the European theater (June-November, 1944).

**Psychiatry in Industry.** The preventive aspect of psychological medicine in industry has received in-

creasing emphasis during the year. At the annual meeting of the American Psychiatric Association, an entire session was devoted to this subject. Psychiatrists attached to the medical services of General Motors, DuPont, and other major manufacturing plants reported the results of their work in resolving personnel problems and contributing to work efficiency and increased production. Dersheimer (*Am. J. Psychiat.* Sept. 1946) points out that not only must the industrial psychiatrist understand the psychiatric problems of personnel, but he must be thoroughly familiar with the organization in which they work. "Industries, like individuals, have each their own personalities based on the personalities of top management, on company policies, the type of industry, and a host of other varying factors." As a result of two years' study of the psychiatric problems in industry, Dersheimer concludes that "the basic causes of all functional mental disease exist, grow, and cause some manifestations in normal people; that normal people are the hosts or carriers from whom unfortunate individuals contract the more serious, recognized forms of this group of ills. . . . Industry offers the psychiatrist an unique opportunity to explore this important area, now one of almost complete darkness."

Extraordinarily favorable conditions for the development of community and industrial psychiatry were afforded at Oak Ridge, Tennessee, where a wartime city of 75,000 sprang up almost overnight, and where from the beginning psychiatric services were incorporated as a necessary feature of the medical set-up. The recorded experience of the Oak Ridge psychiatrists (Clarke, *Am. J. Psychiat.*, Jan. 1946; Leggo, Law, and Clarke, *Industrial Med.*, Apl. 1946; Clarke and Law, *Occupational Med.*, Aug. 1946) in both prevention and treatment of mental ills offers new and valuable leads in the combined community-occupational field. In their unique Oak Ridge experience only about 10 percent of on-the-job emotional disturbances were traceable directly to the occupational situation; they found the causes of such disturbances mainly within the individual with precipitating factors in the home and in his social environment.

Burlingame, who was the first full-time psychiatrist in industry (1915, The Cheney Silk Company), found "that maladjustment in the emotional drives and attitudes of employees toward the employment situation costs the company more in production than accidents and disease." This author (*Am. J. Psychiat.*, Jan. 1947) gives an excellent review of the history of industrial psychiatry and its present position and prospects, with reference particularly to rehabilitation problems following World War II.

**Federal Undertaking.** The United States Public Health Service has, during the war years and now in the should-be peace time, taken greatly increased interest in the prevention and treatment of psychiatric disorders as an integral part of the public health program. Felix (*Mental Hygiene*, July 1946), looking to the future, offers a blue print for such a program. That there is a dearth of qualified psychiatrists throughout the country and a woefully unequal distribution is indisputable. It has been estimated that there are only about 3,500 experienced psychiatrists in the United States, about 1,000 of them being with the Army and Navy. These physicians tend to be concentrated in the metropolitan centers. Their numbers vary, according to the directory of the American Psychiatric Association, from 585 in New York State to none in Nevada. More urgently important, however, than a vast recruitment of specialists, is more widespread

and better training of medical students, physicians, nurses, and other clinical personnel in psychological medicine, because a considerable portion of this field lies properly in the province of the general physician. Further, there should be an extension of mental hygiene discipline in the schools, at primary and secondary school and college levels, to the end not only of prevention and early detection of unwholesome mental processes, but—best prophylaxis of all—for training youth in the use of their minds. A remark of the psychologist Jastrow may be recalled, that people think first and learn to think afterward. Unfortunately one must sometimes add, "if ever."

The National Mental Health Act, recently passed by the U.S. Congress, is reviewed and discussed by Russell (*Am. J. Psychiat.*, Nov. 1946). The Act "has brought mental illnesses, public provision for which has heretofore been almost entirely a state and local responsibility, within the purview of a national health problem. . . . The Act is designed to bring into action a national mental health program, prepared by the U. S. Public Health Service and directed to (1) training of personnel, (2) research, and (3) improvement of mental health services. The administration is by the Surgeon General of the Public Health Service, assisted by an Advisory Council, consisting of the Surgeon General, chairman ex officio, and six members appointed by him from 'leading medical or scientific authorities who are outstanding in the study, diagnosis or treatment of psychiatric disorders.'"

The Act also provides for the establishment of a ten-million-dollar National Mental Health Institute in the vicinity of Washington. The Institute, which will include a two-hundred-bed hospital and laboratories, is intended to be a national headquarters for training and research in psychiatry. It will also sponsor and aid projects for advancement in psychiatric practice, teaching and investigation throughout the country.

It is to be hoped the realization of this magnificently ambitious program will establish in a too long neglected field a record of accomplishment, by the U.S. Public Health Service to compare favorably with the splendid achievements already to the credit of that service.

The paramount public health problem today is that of providing adequate facilities in all the states of the Union for the treatment of mental illness, including far-reaching improvement in facilities that already exist. There is also the crying need, reiterated through the years, for eliminating partisan political influence in the administration of state mental hospitals.

Urgently required also is a vastly simplified and uniform commitment law which shall apply in all the land. Ideally such a law would be simplified almost to the point of abrogation; for it must be remembered that in most jurisdictions existing laws relating to the disposal of mental patients are but vestiges of an antique social viewpoint from which the 'insane' and the 'criminal' were hardly to be distinguished. It makes us pause to realize that, so far as the public hospitals are concerned, the psychiatric patient is the only sick person who cannot receive the treatment he may urgently require until due process of law has been complied with.

More than twenty years ago the American Psychiatric Association set up minimum standards applying to all aspects of the state psychiatric services. These have been confirmed and reaffirmed from time to time since. They were somewhat elaborated and declared in the most positive manner at the 1946 meeting of the Association. In most state insti-

tutions these minimum goals are still to be attained.

The paths of advance are clear. It will be a test of the purpose of the authorities—the Congress and the Public Health Service—to show in what manner and degree the objectives of the National Mental Health Act can be accomplished. Psychiatry is the unique medical discipline in which from its beginnings on this continent state medicine—or political medicine, as Burlingame appropriately calls it—has had its say and its practice. It has not been exactly a noble experiment. In this federal undertaking now lies the opportunity to do a better job than, in the aggregate, the States have done and so facilitate better work on the part of the States themselves.

**Penicillin in Neurosyphilis.** In recent years much more aggressive treatment programs have been instituted for psychiatric disorders. Among the newer developments is the employment of penicillin in the treatment of neurosyphilis, including paresis. As is to be expected in the early stages of a new procedure, reports of results are somewhat conflicting. Reynolds, Mohr, and Moore (*J.A.M.A.*, Aug. 17, 1946) conclude that "penicillin gives promise of becoming a valuable therapeutic agent in the treatment of dementia paralytica." These authors reported on 41 patients, 24 treated with penicillin alone, and 17 with penicillin combined with malarial therapy, the latter already an established procedure in the treatment of paresis. Penicillin alone produced "some degree of clinical improvement in 11 of 24 patients (46 percent)." Penicillin and malaria combined gave "clinical improvement in at least 10 of 17 patients (58 percent)." This combination they consider to be "for the present, at least, the treatment of choice for patients with dementia paralytica."

Stokes, Steiger, et al (*J.A.M.A.*, May 4, 1946), on the basis of studies continued since 1943, report definite clinical improvement in 30 percent of their cases of dementia paralytica treated with penicillin alone. The spinal fluid formula showed definite improvement in 62 percent; normal or near normal in 39 percent. These spinal fluid responses suggest almost a tropic selectivity of penicillin for the nervous system. These authors agree that penicillin is outranked by malaria as yet in clinical improvement; but suggest that as the period of observation lengthens it may be found to equal or exceed the efficiency of malaria alone or after routine chemotherapy.

O'Leary, Brunsting, and Ockuly (*J.A.M.A.*, Mar. 16, 1946) express less sanguine views. "In cases of early dementia paralytica in which penicillin alone was given, no appreciable clinical improvement was noted. . . . In cases in which malarial therapy and penicillin were administered, the results were comparable to those of the malarially treated group. Our experience was equally unimpressive among the institutionalized parietic patients who had the advanced form of the disease."

Tucker and Robinson (*J.A.M.A.*, Oct. 5, 1946) report serious aggravation of mental symptoms in 2 cases of paresis treated with penicillin; and warn that variations in the commercial product may be responsible for irritative phenomena even of a serious or dangerous kind.

In the treatment of neurosyphilis of all types the majority opinion is that penicillin is the most effective single agent thus far employed; while opinions differ as to the optimum treatment program for the parenchymal form of the disease (paresis), a combination of penicillin with fever therapy being generally favored.

**Shock Therapy.** The various forms of shock ther-

apy, referred to in previous reviews in the *YEAR BOOK*, continue to occupy considerable space in the literature, with increasingly conservative evaluation of results and growing demand for more precise criteria by which results can be judged. Nolan Lewis (*Ment. Hygiene*, Apl. 1946) calls for "a more scientific reporting of results." In summing up the evidence to date he finds that insulin therapy, while it has not fulfilled initial expectations, is useful in schizophrenia. Electric shock is the method of choice in affective disorders, particularly the involutional depressions, in which some authors report favorable results in 90 percent of the cases. It is useful also in manic excitement but to a lesser degree. It does not prevent recurrences of depressive or manic attacks. Although less effective than insulin, it has proved of value in certain types of schizophrenia. Cases presenting affective symptoms also, respond better than the uncomplicated forms.

There is a tendency to begin with electroshock in any case judged suitable for shock therapy; also to use various methods, combined or in sequence, if the original series of treatments has not succeeded. The procedure in all forms and combinations of shock therapy is of course wholly empirical. As Gralnick (*Am. J. Psychiat.*, Mar. 1946), reporting results in the treatment of 276 cases over a three-year period, remarks, "The etiology of the diseases we treat is obscure, and the causal connection between the effects we produce and the results we obtain is hardly clear."

Bond (*Am. J. Psychiat.*, Nov. 1946) has established a record in following up his treated cases. "Of 309 schizophrenic patients treated over a 10-year period in an insulin unit 48.8% were recovered or much improved at the end of treatment, . . . 43% at the end of the first year, and 37% at the end of five years. This compares to a recovery-much improved rate of 16% for control cases under hospital treatment without insulin or other shock treatment." Bond considers therefore that insulin shock therapy in schizophrenia has justified itself; and he emphasizes the fact, which he feels has not had enough consideration, that in cases influenced favorably the effect of the treatment is immediate.

**Alcoholism.** Alcohol addiction, too long regarded merely as a vicious habit and judged from a moralistic or legal point of view, has become within the last few years a serious medical and public health problem and subjected to intensive research. Psychiatry had concerned itself with alcoholism for the most part only as an etiological factor in mental disease. Over the years and in various parts of the country admissions to mental hospitals, attributed to alcoholism, had ranged from 1 to 20 percent of total admissions.

Between the normal drinker and the pathological drinker no sharp line can be drawn; but when, through insensible transition, the drinker no longer controls his habit but is controlled thereby, his case is pathological. In general this means that the alcoholic habit is now a chronic illness and represents some form of personality or mental defect or disorder, toward which, as well as toward the direct effects of alcohol intoxication, treatment must be directed.

This is one of the major problems attacked by various agencies recently set up to study alcoholism. First and principal of these agencies is the Research Council on Problems of Alcohol, organized in 1937 and an affiliate of the American Association for the Advancement of Science. The Council is composed of officers of mental hospitals, insti-

tutions for alcoholics and public health agencies, presidents of universities, representatives of the courts and penal institutions, liquor manufacturers, scientists, business men, religious workers and other interested groups or individuals—and former alcoholics.

The official organ of the Council, the *Quarterly Journal of Studies on Alcohol* has been published regularly since June 1940 and records progress in this long neglected field. An informative brochure, "The Scientific Approach to the Problem of Chronic Alcoholism," issued by the Council, outlines the problems involved, methods of dealing with them and progress to date.

Of drinkers in the United States it is estimated that 6 percent use alcohol to excess; 25 percent of these become chronic alcoholics; i.e., approximately 750,000 U.S. citizens are suffering from chronic alcoholism—a greater number than of active cases of tuberculosis. Remedial measures set forth by the Council include (1) research, (2) increased treatment services, (3) education, (4) industrial and legal controls. Beginnings have been made in certain states, and New Hampshire, New Jersey, Connecticut, and Alabama have established by legislative action special commissions to study alcoholism. In addition a number of cities have set up committees and clinics to deal with the problem.

In the words of President Carlson of the Research Council, "History shows that the solution of the problem of alcoholism lies not in national confusion and neglect, and not in national prohibition. Alcoholism has become a major social and public health problem." And Mr. Howard Coonley, former president of the National Association of Manufacturers, adds, "The medical and scientific approach to the problem of alcoholism should go far toward preventing another prohibition fiasco. . . . Medical Science is working toward a better solution, and the country should support the efforts of scientists in dealing with the problem."

CLARENCE B. FARRAR.

**PUBLIC BUILDINGS ADMINISTRATION (PBA).** An agency of the U.S. Government under the jurisdiction of the Federal Works Agency. It is responsible for the administrative, technical, and clerical functions incident to the design, construction, maintenance, and repair of federal buildings. The Emergency Operations Unit builds federally constructed schools, hospitals, and health buildings under the War Public Works Program. Commissioner in 1946: W. E. Reynolds.

**PUBLIC FINANCE.** Substantial progress was made during 1946 in shifting the Federal finances from a war to a peacetime footing. The Treasury's deficit, which aggregated \$20,676,000,000 for the fiscal year ended June 30, 1946, was expected to drop to \$2,293,000,000 for the 1947 fiscal year. The extent of the reduction in expenditures for the first full postwar fiscal year was disappointing, however. The budget listed outlays of \$42,698,000,000 for the year ended June 30, 1947, although during the war "normal" postwar Federal expenditure of between \$25,000,000,000 and \$35,000,000,000 was anticipated. However, revenues ran well in excess of estimates owing to the high level of national income and the consequent greater than expected productivity of Federal taxes.

On a cash basis, the Federal budget was more than balanced in the 1947 fiscal year. Government agencies and trust funds had a larger surplus of receipts available for the purchase of Government securities than the deficit shown by the budget,

so that there was an excess of cash receipts for the year that could be used to reduce the amount of national debt outstanding in the hands of the public.

The year 1946 witnessed the first decline in the public debt since 1930. After reaching an all-time peak in February of \$279,000,000,000, the total was reduced to \$259,000,000,000 by the end of December. This large debt reduction was made possible only by the huge increase in the Treasury's cash balance in December, 1945 caused by heavy oversubscription of the Victory loan. Between February 28 and December 18, \$23,300,000,000 of maturing certificates of indebtedness, notes, and called bonds were paid off, the Treasury simultaneously reducing its war loan deposit account in commercial banks from \$24,400,000,000 to \$2,200,000,000. At the latter level, Treasury bank deposits had been cut down to what is considered a normal peacetime total equal to about one month's expenditures of the Federal Government.

**Federal Expenditures.** Outlays of the Federal Government in the fiscal year ended June 30, 1946 aggregated \$63,714,000,000, as compared with \$100,405,000,000 in the preceding war year. Of the total, national defense accounted for \$45,012,000,000, veterans' services and benefits \$4,414,000,000 and interest on the public debt \$4,748,000,000.

The 1947 budget message of the President presented a functional classification of Government spending for the first time, in lieu of the classification previously used based upon spending agencies. This functional classification of expenditures for 1946, with estimates for the 1947 and 1948 fiscal years, follows:

BUDGET EXPENDITURES BY MAJOR PROGRAMS  
(For fiscal years in millions of dollars)

Program	Actual 1946	Estimate 1947	Estimate 1948
National defense . . . . .	\$45,012	\$14,726	\$11,256
International affairs and finance .	1,464	6,394	3,510
Veterans' services and benefits .	4,414	7,601	7,343
Social welfare, health, and security .	1,113	1,570	1,654
Housing and community facilities .	—180	544	539
Education and general research .	88	71	88
Agriculture and agricultural resources . . . . .	752	1,117	1,381
Natural resources . . . . .	257	728	1,101
Transportation and communication . . . . .	824	905	1,530
Finance, commerce, and industry .	30	83	426
Labor . . . . .	104	124	118
General government . . . . .	972	1,545	1,492
Interest on the public debt . . . . .	4,748	4,950	5,000
Refunds of receipts . . . . .	3,119	2,155	2,065
Reserve for contingencies . . . . .	—	10	25
Adjustment to daily Treasury statement basis . . . . .	997	—	—
<b>Total . . . . .</b>	<b>63,714</b>	<b>42,523</b>	<b>37,528</b>
From—			
General and special accounts .	65,019	42,698	36,699
Corporation accounts . . . . .	—1,305	—175	829
<b>Total . . . . .</b>	<b>63,714</b>	<b>42,523</b>	<b>37,528</b>

Under the new classification, outlays on atomic energy are shifted from national defense to natural resources, and expenditures for supplies and administration of occupied areas, other than army pay and subsistence, are listed under international affairs and finance. Expenditures projected for the Atomic Energy Commission were \$201,000,000 in the 1947 fiscal year and \$443,000,000 in the fiscal year 1948. In 1947, part of the outlay for this purpose was listed under national defense.

National defense promises to remain the largest item of Federal expenditure for a long time to

come. The break-down of national defense estimates is as follows:

**NATIONAL DEFENSE EXPENDITURES**  
(For fiscal years in millions of dollars)

Program or Agency Concerned	Actual 1946	Estimate 1947	Estimate 1948
<b>Military defense:</b>			
Military .....	\$24,846	\$6,741	\$6,658
Atomic energy .....	430	179	
Naval defense .....	16,763	5,588	4,423
Terminal leave for enlisted personnel .....		1,900	250
<b>Activities supporting defense:</b>			
Lend-lease (excluding War and Navy Departments):			
Treasury Department ..	672	333	34
Maritime Commission and War Shipping Administration ..			
..	1,045	411	....
Agriculture Department ..	1,003	5	....
Other .....	45	35	....
Stock piling of strategic and critical materials			
Treasury Department ..		177	243
Reconstruction Finance Corp ..		-87	-210
Reconstruction Finance Corporation (other) ..	-53	-337	-121
War Shipping Administration (other) ..	187	-250	-34
Other .....	74	30	13
<b>Total .....</b>	<b>45,012</b>	<b>14,726</b>	<b>11,256</b>
<b>From—</b>			
General and special accounts ..	45,066	15,140	11,587
Corporation accounts ..	-53	-424	-331
<b>Total .....</b>	<b>45,012</b>	<b>14,726</b>	<b>11,256</b>

Second in importance among Federal expenditures are veterans' services and benefits. These expenditures were broken down as follows in the budget:

**VETERANS' SERVICES AND BENEFITS**  
(For fiscal years in millions of dollars)

Program or Agency Concerned	Actual 1946	Estimate 1947	Estimate 1948
<b>Readjustment benefits, Veterans' Administration ..</b>	<b>\$1,350</b>	<b>\$3,467</b>	<b>\$3,462</b>
<b>Pensions, Veterans' Administration ..</b>	<b>1,261</b>	<b>2,165</b>	<b>2,492</b>
<b>Insurance, Veterans' Administration ..</b>	<b>1,395</b>	<b>979</b>	<b>73</b>
<b>Hospitals, other services, and administrative costs:</b>

A new item in the budget not found in pre-war years is the large appropriation for international affairs and finance. Even in the fiscal year 1948, more than \$3,500,000,000 is slated to be spent on this account. This total consists of the items listed at the top of column 2.

**Federal Revenues.** Receipts of the Federal Government in the fiscal year 1946 showed only a small decline from the peak attained in 1945, despite the elimination of the excess profits tax and reductions in other income taxes immediately after the end of the war. Budget receipts totaled \$43,038,000,000 in the fiscal year ended June 30, 1946, as compared with \$47,740,000,000 collected in the 1945 fiscal year. The chief sources of the Treasury's receipts in 1946, and estimates for 1947 and 1948, are listed on column 2.

It will be noted that a decline in excise taxes for the 1948 fiscal year is listed, due to the expira-

tion of wartime rates June 30, 1947, or six months after the President's proclamation terminating hostilities. The President proposed extension of these rates on a permanent basis, as indicated at the bottom of the above table.

**Public Debt Management.** Application of Government deposits in banks to the retirement of maturing and called Treasury obligations during the year brought about a reduction of more than \$20,000,000,000 in the public debt between February 28 and December 18. The effect of this debt retirement program was as follows:

**COMPOSITION OF U.S. GOVERNMENT DEBT**  
(In billions of dollars)

	Feb 28, 1946	Dec 18, 1946	Change
<b>Treasury bills ..</b>	<b>\$ 17 0</b>	<b>\$ 17 0</b>	<b>..</b>

<b>Gross public debt ..</b>	<b>\$279 2</b>	<b>\$258 7</b>	<b>-20 5</b>

There were no public offerings of Treasury marketable securities for new money during 1946. Treasury bills were sold weekly to replace those maturing, and  $\frac{1}{8}$  percent certificates of indebtedness were offered in exchange for a part of those maturing during the year. Treasury notes falling due in March, July, and December, and bonds called in March and June, were redeemed for cash.

Sales of savings bonds were continued actively during the year, and a special effort was made late in the year to increase public subscriptions. However, redemptions of Series E bonds materially exceeded new sales. This was more than offset by excess sales over redemptions of Series F and Series G bonds. Sales and redemptions each month of Series E, F, and G bonds were as follows:

UNITED STATES SAVINGS BONDS  
(In millions of dollars)

Month	SALES			REDEMPTIONS		
	Series E	Series F	Series G	Series E	Series F	Series G
January .....	641	40	278	535	13	33
February .....	367	30	225	486	15	30
March .....	371	27	228	543	16	37

May .....	345	24	225	462	17	37
June .....	321	24	226	432	15	36
July .....	386	31	335	435	18	40
August .....	347	25	217	393	17	34
September .....	309	20	165	402	16	34
October .....	327	24	169	405	14	33
November .....	294	20	139	329	17	40
December .....	370	29	178	386	17	42

The average interest rate on the entire public debt increased during the year from 1.963 to 2.056 percent. This increase occurred despite the fact that there was no change in the public debt interest rate structure. Reduction of the amount of low-rate certificates of indebtedness and notes outstanding, the relatively high rate of interest payable on special Treasury issues sold to trust funds and agencies and the higher interest accruing on savings bonds that remain outstanding contributed to raising the average rate on the public debt as a whole.

Treasury agencies and corporations added substantially to their holdings of Government securities during the year. The increase of these holdings, and the identity of the agencies acquiring them, may be seen from the following table:

SPECIAL ISSUES HELD BY GOVERNMENT AGENCIES AND TRUST FUNDS  
(In millions of dollars)

Outstanding at End of Month	Total	Federal Deposit Insurance Corp	Federal <sup>a</sup> Old-Age, etc., Ins. Trust Fund	Federal <sup>b</sup> Savings & Loan Ins. Corp. <sup>a</sup> Federal Old-Age and Survivors Insurance Trust Funds. <sup>b</sup> Federal Savings and Loan Insurance Corporation

The Treasury's debt retirement program produced a substantial decline in holdings of Treasury securities by commercial banks and by corporate investors who applied Government security holdings to pay taxes and meet business expenditures. Some individual investors who had subscribed to the Victory loan on a speculative basis also liquidated on balance. On the other hand, insurance

companies and savings banks added to their holdings of Government securities, as shown by the accompanying chart.

HOLDINGS OF U.S. GOVERNMENT SECURITIES

**Government Corporations.** Several Government-owned corporations that played an important role in the war, such as the Rubber Development Corporation and the Defense Homes Corporation, were slated for early liquidation. On the other hand, operations of the Export-Import Bank were expanded substantially, while veterans' housing legislation increased the authority of the Federal Housing Administration to insure home mortgages and authorized Reconstruction Finance Corporation to subsidize building materials production.

President Truman's budget message proposed

that the activities of Government corporations be focused upon veterans' housing, rural electrification, price support for farm commodities, and foreign loans. Such activities could properly be carried out by corporations, rather than by direct Government agencies, because their activities are considered potentially self-sustaining and involve transactions of a business character with the public.

The President proposed, however, that the authority of Government corporations to sell guaranteed obligations to the public be repealed, so that they would have to obtain their funds exclusively from the Treasury.

Congressional authority was asked for the redemption by the Federal Deposit Insurance Corporation of its stock held by the Federal Reserve banks, and of \$100,000,000 of the \$150,000,000 of stock originally acquired by the Treasury.

Government corporations had a total borrowing power of \$32,199,000,000 on June 30, 1946, and had issued obligations totaling \$11,964,000,000. Of this total, \$11,673,000,000 was owned by the Treasury, and \$291,000,000 by other holders.

JULES I. BOGEN.

**PUBLIC HEALTH SERVICE, U.S.** The United States Public Health Service, a unit of the Federal Security Agency, is the principal Federal agency devoted to protection of the nation's health. Its functions are: to extend and improve State and local health services through leadership, technical assistance, and the administration of financial aid; to protect the nation from the introduction of dangerous communicable diseases from abroad; to prevent the spread of communicable diseases from State to State; to seek the cause, prevention and cure for the diseases of mankind; to control the manufacture and sale of biologicals; to operate marine hospitals; and to disseminate public health information.

First established as the Marine Hospital Service in 1798 for "relief of sick and disabled seamen," the Service today provides medical care to all United States Merchant Seamen, Coast Guard, Public Health Service Commissioned Corps, field personnel and their families, as well as certain beneficiaries in other government agencies. In July, 1944, an Act reorganized the Service and codified all the existing health legislation and titles of authority into one basic law.

Groups serving as advisory boards to the Public Health Service are the National Advisory Health Council and the National Advisory Cancer Council, specifically authorized by the public health law. These Councils consult with and make recommendations to the Surgeon General in matters concerning grants-in-aid, grants for general research, health activities, and functions of the Service. Other advisory boards are the Sanitation Advisory Board, Advisory Committee to the Division of Nurse Education, Board for the Control of Biological Products, Advisory Council on Nervous and Mental Diseases, Mental Hospital Survey Committee, Committee of Consultants in Dermatology, Committee on Post-War Training of Public Health Personnel, and the United States Public Health Service Advisory Committee on Public Education for the Prevention of Venereal Disease.

The Service is administered through 4 bureaus: the Office of the Surgeon General, National Institute of Health, Bureau of Medical Services, and the Bureau of State Services. Nine District Offices carry on the field activities under the direction of a commissioned medical officer. Eight of these Offices are in continental United States and one is in Puerto Rico.

During 1946 the Public Health Service was reoriented from the emergency demands of wartime. The immediate problem was one of rebuilding depleted health staffs, and of meeting urgent needs accumulated during the war years. The second big job was to gauge present and future needs, and to further the renewed development of integrated health facilities and services. Besides red-

recting its own activities, the Public Health Service was also actively concerned in assisting State and local health departments and other health agencies with their reconversion problems.

In the first peacetime year, the Public Health Service expanded into new fields of health activity. The American public had gained a new awareness of health problems during the four years of conflict. Rates and reasons for Selective Service rejections were an index to national health conditions. Accelerated progress in scientific research and medical discovery during the war gave new hopes for physical fitness, and prompted concerted action. Millions of service men and women have been discharged from service with a new knowledge of the benefits of comprehensive medical care and preventive medicine.

New developments affecting Public Health Service were milestones in national and international public health history. They are: (1) the drafting and signing of a Constitution for the World Health Organization; (2) passage of the Hospital Survey and Construction Act; and (3) passage of the National Mental Health Act.

**Health on the International Scene.** New horizons in the field of public health opened when 61 nations signed the Constitution of the World Health Organization in July 1946, at the International Health Conference in New York. Convened by the United Nations, it set forth a new philosophy of international health relations, and established the framework for an organization of greater scope and authority than any previously created; it was dedicated not only to preventing the spread of disease, but to positive improvement in health for all peoples throughout the world.

International cooperation on health matters was to help to bring about better international understanding and good will. All existing international health agencies were to be brought into relationship with World Health, and leave the way open for the admission of all nations, including non-members of the United Nations.

An Interim Commission was set up with the United States as a member, to carry on preliminary activities. The Organization will come into being officially when 26 of the United Nations ratify its Constitution. During the past year, an Office of International Health Relations was established to further the various international activities of the Public Health Service, and to prepare for the responsibilities which will come when the new Organization is inaugurated.

**Hospital Act.** The Hospital Survey and Construction Act authorized \$3,000,000, of which \$2,350,000 was appropriated for administration and for grants to States for surveys of hospital needs. The Act authorized the appropriation of \$375,000,000 for construction over the next five years. For both surveys and construction, the States were to meet two-thirds of the cost of the program, after submitting a plan for approval before Federal funds can be granted. The Act established the first national policy under which hospitals are to be planned, located, and operated in relation to overall health needs. Evolved through the leadership of hospital authorities, this policy recognizes the integrated role which hospitals, health centers and related facilities must play in future health programs. These are essential workshops in providing even the minimum in modern health and medical services to the nation as a whole.

**Mental Hygiene.** The National Mental Health Act launched the first national attack on a condition which was already acute, but which the war dra-

matically emphasized. The problem reached national focus through the large number of Selective Service rejections for mental disorders; through the psychiatric experience of our armed forces; and through the severe overcrowding and understaffing of our civilian mental institutions.

The Act authorized the appropriation of \$7,500,000 for construction of a National Institute of Mental Health for research, to serve as a center for the coordination of research and the exchange of information, and provide advanced training for specialists in this field. To finance the program, an increase of \$10,000,000 a year was authorized in the appropriation for assistance to States, providing for research, for research grants to other institutions, for aid in the training of personnel, and for grants to the States for the development of mental hygiene programs, with special emphasis on prevention and early treatment.

The Mental Health Act is the first permanent Federal legislation authorizing grants to educational institutions.

**Aid to States.** Under the grant-in-aid program of the Public Health Service, payments to the States for general health services totalled \$10,963,653 in the year ending June 30, 1946, or \$50,163 more than in the previous year. Federal funds from this grant-in-aid program continued to act as a stimulus for larger appropriations by States. Forty-five States reported an increase of more than \$8,000,000 in their 1946 appropriations, and indications were that this amount would be surpassed in 1947. Continuing personnel shortages retarded development of new local health organizations, however, and there was little change in the number of full-time health services operating in the Nation as a whole.

**Control of Tuberculosis.** The current use of more than 700 miniature film X-ray units by official and voluntary agencies was one result of the stimulus which the Public Health Service gave tuberculosis control. During the past year, the Service stressed the value of routine chest X-rays for all patients admitted to general hospitals, and emphasized the practicability of surveying entire populations of rural areas with mobile units. Design of new equipment improved the efficiency of these units.

Need for treatment facilities for cases found in mass surveys was stressed. More than 15 States appropriated funds for building sanatoria or clinics, or acquired surplus military hospitals for tuberculosis therapy. To restore the convalescent tuberculosis patient to economic self-sufficiency as soon as possible, a joint program of improving methods of vocational rehabilitation was undertaken with the National Tuberculosis Association and the Office of Vocational Rehabilitation. Research continued on a wide variety of problems in the diagnosis, care and treatment of tuberculosis.

**Venereal Disease Campaign.** With the development and application of new and effective methods for the treatment of venereal disease, the Public Health Service shifted emphasis to the problems of finding new cases of venereal infection, and of tracing and bringing to treatment as many contacts as possible.

Rapid progress was continued. During the year, careful studies of the newest methods of treatment were under way, and 52 additional projects for facilities for the rapid treatment of syphilis were approved. Intensive 45-day community case-finding programs were carried out in four localities, and their success demonstrated that excellent public cooperation was obtainable in this type of survey.

**Hygiene in Industry.** Fruitful results came from the close working relationship maintained between the Public Health Service and State and local industrial hygiene units. Forty State units, in addition to local units, were carrying on this work by July 1946, with the financial assistance of Public Health Service grants-in-aid. During the year, four States passed new occupational compensation laws, bringing to 33 the total of States with such laws. Several other States have taken steps in the further development of industrial hygiene activities.

Industrial reconversion and the introduction of new industrial processes presented many problems, and personnel shortages were acute.

**Control of Communicable Diseases.** Release from wartime demands for protection of concentrations of military and civilian war-industry personnel permitted the Service to redirect its efforts in malaria control to a more permanent peacetime attack on the constant foci of malaria infection. Integrated with this program was work in the control of various diseases of tropical origin to which our servicemen were exposed overseas. The work is carried on by the Communicable Disease Center established in Atlanta, Georgia, in July 1946, to succeed the Office of Malaria Control in War Areas. State and local participation in these programs increased as personnel and funds became available. One example is the fact that State and local units have borne 62 percent of the cost of typhus control work.

A training center in communicable disease control was established in Savannah, Georgia, to provide public health internships and laboratory training for health department personnel, as well as in-service training for personnel of the Public Health Service.

**Cancer Research and Treatment.** The release of scientists from war work accelerated cancer research. In addition to studies in progress at the National Cancer Institute, a unit of Public Health Service, further research was made possible through 42 grants-in-aid allocated to various institutions in June 1946. Forty-seven loans of radium to hospitals for cancer treatment were in effect. Increasing numbers of physicians were trained in the diagnosis and treatment of cancer, and \$2,500,000 was made available for cancer control grants-in-aid to the States in the fiscal year 1947—the first funds to be identified for this purpose. A national survey of cancer facilities and services was completed and published by the National Advisory Cancer Council.

**General Research.** Grant-in-aid funds once more became available for research on a variety of peacetime health problems. In the first six months of 1946, 67 grants were approved. A total of 129, involving 71 universities in 26 States, had been recommended for the fiscal year 1947. These were in addition to grants made for cancer research.

At the National Institute of Health, a unit of the Service, research continued in wide fields of medical science. In the year ending June 30, 1946, 392 drugs were tested for anti-malarial action, some of them proving to be from 32 to 128 times as active as quinine. This study was part of a program undertaken in cooperation with the Committee of Medical Research of the Office of Scientific Research and Development. The combination of an antibiotic and a sulfone was found more effective in experimental tuberculosis than the same drugs given singly. Important studies were concerned with a mumps vaccine, Q fever, and other rickettsial diseases; homologous serum jaundice; improvement of the production of vaccines for yellow fever, typhus, and Rocky Mountain spotted fever;

dysentery; narcotics; nutrition; tropical diseases; diseases of old age; and the biological effects of neutron bombardment from the cyclotron.

**Demonstration Projects.** The value of fluorides in the reduction of tooth decay was a demonstration study project which has been under way for three years. Results obtained through the year indicated that the application of fluorides to the teeth of children reduced the occurrence of cavities by more than one-third.

During the year other demonstrations had begun: to demonstrate a program of dental care for school children; to study the extent of malnutrition and methods for detecting it; to develop methods for the early diagnosis of heart disease on a mass survey basis; and to demonstrate the control of some 40 animal diseases which can be transmitted to man. A demonstration of the early diagnosis and control of diabetes was being developed.

**Nursing Activities.** Civilian hospitals and health agencies suffered an acute shortage of nursing personnel during the year, in spite of the demobilization of nurses from the armed forces. The Public Health Service had assisted in recruitment activities, and also had continued the training of students already enrolled in the Cadet Nurse Corps before the end of the war.

**Medical Services to Beneficiaries.** Medical services of the Public Health Service did not decline appreciably, due in part to a tendency of Coast Guardsmen, merchant seamen, and other beneficiaries of Public Health Service to seek treatment which had been postponed during the war.

An extended program of physical medicine and rehabilitation was inaugurated in the Public Health Service Marine hospitals, in order to make fullest use of new techniques which had been developed in this field. Progress was made in developing the post-graduate training program in these hospitals. Ten were approved for residencies in general surgery, and four for other specialties. There were studies of streptomycin and of improved methods in the treatment of leprosy.

**Foreign Quarantine Measures.** While grave health hazards, including cholera and a virulent form of smallpox, prevailed in many areas abroad, the United States kept virtually free of quarantinable diseases. At the request of the Department of State, the Public Health Service resumed the practice of assigning medical officers to the U.S. consulates overseas, to examine prospective immigrants before their departure for this country.

During the year, Foreign Quarantine Regulations were revised, giving particular attention to the problems arising from the expansion of rapid air and sea transportation. Quarantine services were provided at newly established airports of entry in the interior regions of the nation, and steps were taken to deal with the quarantine problem of emergency landings of incoming aircraft at other fields and landing strips.

**Sanitary Engineering Program.** Public Health's program of environmental sanitation provided another barrier against the importation of disease and its interstate spread. Plans for new ships were reviewed and operating vessels inspected to insure proper sanitation and ratproofing of America's merchant fleet. Interstate land and air carriers were under supervision to safeguard the water, milk, and food served to travelers. Advisory assistance was rendered to certain other Federal agencies on sanitation problems. State and local health departments were also aided in the promotion of the sanitary control of water, milk, frozen desserts, shellfish, food establishments, sewage, and refuse dis-

posal, and housing. Surveys were conducted of the Nation's need for sanitation facilities, and of disease outbreaks traceable to insanitary environment. The research station continued to render service to States in the solution of their problems of water supply, sewage disposal, and stream pollution abatement techniques.

**Disease and Death Rates.** Although above average incidence was recorded for three important communicable diseases during 1945, the general health of the Nation remained good. The outbreak of influenza which began in November and continued through February appeared to be less severe than that of two years previous to that time. State Health officers reported a total of 486,345 cases between mid-November and mid-February, as compared with 620,052 for the corresponding period in 1943-44.

Diphtheria rose to 18,606 cases in this country during 1945, as compared with 14,122 cases in 1944. Preliminary reports also indicated an accompanying increase in diphtheria mortality.

For the third consecutive year, poliomyelitis reached epidemic proportions in 1945, with 13,145 cases reported. Incidence for 1944 was 19,029, and for 1943, 12,449. Reports so far received for 1946 showed this to be another year of unusual incidence.

Smallpox introduced from the Orient occurred during the 1945-46 period in the San Francisco and Seattle areas. From the appearance of the first case in San Francisco on December 29, the outbreak resulted in 13 cases and no deaths in California, before the last case was reported on March 27. In Seattle the first case appeared on February 5, the last on May 24, with a reported total of 68 cases and 20 deaths in the State of Washington.

In a majority of the States, reports of malaria cases originating within the United States showed the continuing decline observed since 1935.

The provisional rate of death from all causes in 1945 was 10.6 per 1,000 population (exclusive of the armed forces overseas), the same as the rate for 1944. During the first five months of 1946, the provisional death rate was 10.9, as compared with 10.8 for the same period in 1945.

**National Office of Vital Statistics.** The Vital Statistics Division was transferred from the Bureau of the Census, Department of Commerce, to the U.S. Public Health Service, Federal Security Agency, under the President's Reorganization Plan No. 2 of 1946, which became effective on July 16, 1946. It is designated as the National Office of Vital Statistics. Thus the Public Health Service had chief responsibility for collection and publication of national vital statistics. These included statistics on the incidence and prevalence of disease, as well as births, stillbirths, deaths and causes of deaths, and on marriages and divorces.

THOMAS PARRAN.

**PUBLIC ROADS ADMINISTRATION (PRA).** An agency of the U.S. Government under the jurisdiction of the Federal Works Agency. It normally administers Federal-aid funds and emergency appropriations for road construction, cooperating with State highway departments. It cooperates with the Department of Agriculture on forest roads and supervises the construction of national park roads.

The Federal-Aid Highway Act of December 20, 1944, authorized the use of \$500,000,000 for needed highway improvements and to provide employment during the first 3 postwar years. A National Interstate Highway System to connect metro-

politan areas and industrial centers and to serve the national defense was designated. Other plans included the development of secondary road systems in the various states and the modernization of various sections of the Federal-Aid system.

The organization is cooperating with the countries of Central America in closing gaps in the Inter-American Highway between the southern border of Mexico and the Panama Canal.

Commissioner in 1946. Thomas H. MacDonald. See BRIDGES; ROADS.

**PUERTO RICO.** A West Indian island, forming a Territory of the United States; acquired from Spain through the Treaty of Paris, 1898. The adjacent islands of Vieques, Mona, and Culebra are included in its jurisdiction. The area of Puerto Rico is approximately 3,435 square miles.

**Population.** As of July 1, 1944, it was estimated at 2,037,255 as compared with 1,869,255 in 1940. During the 1940 census, dwellers in places of 2,500 or more numbered 566,357 and the rural population 1,302,898. The territory had 544.2 inhabitants to the square mile—an exceptional density for an area dependent mainly on agriculture. Chief cities: San Juan (capital) 169,247 inhabitants, Ponce 65,182, Mayaguez 50,376. Seventy-six percent of the people are native-born whites and the remaining 24 percent are for the most part Negroes and Mulattoes. During 1943 there were 77,304 births and 29,019 deaths.

**Education.** Out of more than 700,000 children of school age, only 309,595 were enrolled in the public schools during the fiscal year 1944. There were 7,088 field personnel and teaching positions in the Puerto Rican School System. The University of Puerto Rico located at Rio Piedras, ten miles from San Juan, had 6,067 students in 1943-44.

**The Economy.** The island is predominantly agricultural, with about 825,000 acres under cultivation out of a total area of some 2,000,000 acres. The two leading export products are sugar and tobacco followed by fruits and coffee. Lack of shipping space has curtailed exports of fruits and coffee. Shipments of domestic and foreign merchandise from the United States to Puerto Rico in 1943 and 1944 amounted to approximately \$87,000,000 and \$119,000,000 while shipments from Puerto Rico to the United States amounted to \$99,000,000 and \$123,000,000, respectively.

Sugar shipments from Puerto Rico accounted for \$45,000,000 and \$53,000,000 while rum shipments accounted for \$24,000,000 in both years, and tobacco, \$12,000,000. In 1943-1944 there were 723,611 short tons of sugar produced, 15,000 short tons of tobacco and 11,000 short tons of coffee.

Needlework is the largest industry of the island not associated with agriculture and during 1943-44 exports totaled approximately \$14,500,000.

**Government.** Under the Organic Act that was passed by the U.S. Congress in 1917 and later amended, Puerto Rico has the status of an organized territory of the United States. Its citizens are U.S. citizens. The executive power of the Territorial Government is vested in a Governor (Jesus T. Pinero) who is appointed for an indefinite term by the President of the United States, subject to confirmation by the U.S. Senate. The legislative power is vested in a Legislature of two houses which is elected by popular vote for a four-year term. In addition, there is a Resident Commissioner to the United States who is elected by the popular vote for a four-year term.

**Events, 1946.** Politically, the year opened on a promising theme for Puerto Rico. On the first day

of the year, the American Civil Liberties Union urged action on the part of the United States that would lead to self-determination for Puerto Rico. President Truman, in his annual State of the Union message to Congress on January 22, requested that means be provided whereby Puerto Ricans could select their own form of government and determine their ultimate status with respect to the United States.

Two bills passed by the Insular Legislature, which would give the Island voice in selecting its next Governor and authorize a plebiscite to determine the Islands' permanent political status in relation with the United States were vetoed on March 2 by Governor Rexford G. Tugwell. Provisions of the two bills were: 1. A poll among qualified voters, on or before July 4, 1946, in which each of the Islands' political parties would submit the names of one candidate—either continental or Puerto Rican—for Governor. The candidate winning the poll would be "recommended" to President Truman for appointment as Governor; 2. A plebiscite on or before July 4, which Puerto Ricans would make a choice of independence, statehood or dominion status for the Island.

Governor Tugwell's objections were based on his feelings that the first bill interfered with the power of appointment of the President of the United States and the second bill conflicted with the United States Congress and jeopardized congressional authority for an official plebiscite.

Passage of the two bills over the veto could be accomplished by a two-thirds majority, after which the bills would go directly to the President of the United States. Puerto Rican Senate President Luis Marrin urged passage of the bills and the Insular Legislature overrode the veto by a vote of 41 to 4 on March 4. In the two previous instances that the Senate rejected a veto since 1898, the President has upheld the Governor.

After identical measures for a Puerto Rican referendum on political status were submitted on March 28 in the United States House and Senate, the United States Tariff Commission reported that the Island could approach self-support only if 1,000,000 people emigrated and a sharp diminution occurred in the birth rate of those remaining. Without aid the Island could not support its current population of more than 2,000,000, which was increasing at the rate of 100 a day.

Since 1898, the date of the Island's cession by Spain, the Commission estimated that the Puerto Ricans have benefited to the extent of \$580,000,000 in direct federal disbursements, expenditures and remittances, \$82,000,000 in loans from federal agencies and \$167,000,000 in military expenditures, mostly between 1941 and 1944. In addition the Island was aided by trade benefits resulting from duty-free access to mainland markets. In April a Puerto Rican legislative delegation arrived in Washington with the proposal for a plebiscite which also provided for economic guarantees.

Governor Tugwell resigned as Governor on June 30 after giving President Truman three months notice. The Puerto Rican Legislature sent a petition to President Truman urging the appointment of Jesus T. Pinero, Puerto Rican Resident Commissioner in Washington, to the vacant post.

On July 25 President Truman appointed Pinero, leader of the Popular Democratic Party, to the Governorship. This marked the first time that a Puerto Rican-born citizen had been selected for the office. In the inaugural ceremonies held on September 3, Governor Pinero asserted that the basic pattern of the Tugwell administration met with his

unqualified approval and promised efforts to enable Puerto Ricans to elect their own chief executive.

After re-passing the Language Bill over Governor Tugwell's veto, the Insular Legislature found their attempt to provide instruction of school subjects in Spanish vetoed by President Truman on October 28. The proposed bill was aimed at reversing the prevailing practise of teaching school in English and including Spanish as a subject in the curriculum. In his veto message President Truman stressed the political implications of continuing the use of English as the medium of instruction. Six thousand university students were joined by several hundred high school and intermediate school pupils on November 8 in a one-day protest strike against President Truman's veto.

The maritime strike that gripped United States ports in the late summer created a crisis in Puerto Rico's economy and revealed the Island's dependence on the United States. On October 19 Governor Pinero appealed to the maritime union strike leaders to permit emergency shipments of food. By October 27 the primary staple food, rice, had decreased to one week's supply, while beans, butter, meat and flour were practically exhausted. The development of a black market forced rice to rise from 9 cents to 25 cents a pound and butter was sold as high as \$2 a pound. After the strike ended in early November, Governor Pinero announced that controls would be maintained on a limited number of food items, especially rice which would be strictly rationed.

Professor Manuel Villaronga was appointed Commissioner of Education for Puerto Rico in early December.

**PULITZER PRIZES.** A series of annual awards established in 1915 by the will of Joseph Pulitzer, publisher of the *New York World*. On May 6, 1946, the following awards were made by the trustees of Columbia University on the recommendation of the Advisory Board of the Graduate School of Journalism:

Prizes in Journalism: (1) For the most distinguished and meritorious public service rendered by an American newspaper, a gold medal costing \$500: to *The Scranton Times* (Pennsylvania) for provoking the resignation and later indictment of United States District Court Judge Albert W. Johnson of the Middle District of Pennsylvania by a fifteen-year investigation of local judicial practices. (2) For distinguished correspondence, \$500: to Arnaldo Cortesi of *The New York Times* for his dispatches from Buenos Aires. (3) For distinguished telegraphic reporting on national affairs, \$500: to Edward A. Harris of *The St. Louis Post-Dispatch* for his articles on the tide-water oil situation, which contributed to the opposition of Edwin A. Pauley as Under-Secretary of the Navy. (4) For distinguished telegraphic reporting on international affairs, \$500: to Homer Bigart of *The New York Herald Tribune* for his war correspondence from the Pacific theatre. (5) For a distinguished example of a reporter's work, \$500: to William L. Lawrence of *The New York Times* for his eye-witness account of the atom-bombing of Nagasaki and his subsequent articles on the development of the atomic bomb. (6) For distinguished editorial writing, \$500: to Hodding Carter of *The Delta Democrat-Times* of Greenville, Mississippi, for a series of editorials on the subject of racial, religious, and economic intolerance. (7) For distinguished work as a cartoonist, \$500: to Bruce Russell of *The Los Angeles Times* for a cartoon entitled "Time to

Bridge That Gulch." The award in the field of news photography was omitted.

Prizes in Letters: (1) For an original American play, performed in New York, preferably dealing with American life, \$500: to Russel Crouse and Howard Lindsay for *State of the Union*, produced by Leland Hayward. (2) For a distinguished work on American history, \$500: to Arthur M. Schlesinger, Jr., for *The Age of Jackson*. (3) For a distinguished American biography, \$500: to Linnie Marsh Wolfe for *Son of the Wilderness*, the life of John Muir. This award was posthumous, as Mrs. Wolfe died September 15, 1945.

No award was given in the field of fiction or poetry.

Prize in Music: For a distinguished musical composition, \$500: to Leo Sowerby, for *The Canticle of Spring* commissioned by the Alice M. Ditson Fund and first performed by the Schola Cantorum in New York City in April.

Annual Scholarship: To an art student in America certified by the American Academy of Design, \$1,500: to Iris Maraghiotti of Ardsley and Fort Hill Roads, Scarsdale, New York.

**RACING.** Any review of racing must be written in figures and the American version of the so-called sport of kings, which had touched almost unbelievable heights in 1945, rocketed right into the stratosphere last year. Attendance for all the nation's tracks soared from 18,900,000 to a new all-time high of 25,000,000 and pari-mutuel betting zoomed from the record \$1,413,000,000 of the previous campaign to \$1,760,000,000 in 1946.

The over-all financial gain was made despite a slight falling off in the daily average for the big New York tracks because of an additional 5 percent tax the City of New York slapped on wagers. The bettors objected vehemently to the levy, but the city's fathers remained firm and the added tax dropped a cool \$14,000,000 into Father Knickerbocker's till.

Assault, a little horse with a stout heart, provided numerous thrills for turf followers with a series of extraordinary feats during the campaign. The Texas-bred chestnut son of Bold Venture-Igual, owned by the King Ranch, started the year winning six of seven outings, including a sweep of the famous triple crown, faded in midsummer with a kidney ailment that caused him to drop six straight races, then returned in the Fall to take the Pimlico Special and Westchester Handicap and clinch honors as the horse of the year.

His earnings as a 3-year-old aggregated \$424,195, a record for one season, while his total of \$441,445 for two years of campaigning put him third on the list of all-time money winners.

Assault's greatest triumph came in the seventy-second running of the Kentucky Derby just ten years after his sire, Bold Venture, had turned the trick in the blue ribbon classic of turfdom. A record American race crowd of 100,000 looked on as the King Ranch star came winging down the stretch to defeat Spy Song, the early pace-maker, by eight lengths. Warren Mehrtens piloted Assault in his victory which was worth \$96,400, highest award in the history of the Derby that goes back to 1875.

With Mehrtens again in the saddle, Assault raced to added glory in the Preakness before a record crowd of 42,370. Assault was hard-pressed to take the roses at Pimlico, standing off a stirring challenge by Lord Boswell to win by a neck. Then the King Ranch star added the third jewel to the mythical triple crown by winning the Belmont Stakes, young Mehrtens again having the mount.

Other notables during the long campaign were the Calumet Farm's 5-year-old gelding Armed, champion of the handicap division; Mrs. Ethel D. Jacobs' Stymie, who ran his earnings to \$516,285, only one handicap purse short of Whirlaway's supreme total of \$561,161; George D. Widener's Lucky Draw, who cracked six track marks; C. V. Whitney's First Flight, leading juvenile; the King Ranch's Bridal Flower; and Louis B. Mayer's Honeymoon.

The Calumet Farm was the leading money-winning stable, while Ben Jones topped the trainers in earnings and William Molter was first in number of winners saddled. The veteran Ted Atkinson, who booted home 233 winners, was the country's No. 1 jockey of the year.

Harness racing also enjoyed its greatest twelve months in history with 1,200 meetings sanctioned by the United States Trotting Association and more than \$100,000,000 wagered through the pari-mutuels. The sessions at Roosevelt Park in Westbury, Long Island, New York, accounted for about half the total bet on the trotters and pacers.

The historic Hambletonian was won by Chestertown; Kaola captured the Western Grand Trot and Blue Agan took the Western Grand Pace. Despite Chestertown's triumph in the old classic at Coshen, New York, Victory Song, with a mile clocking of 1:59½, generally was accepted as the outstanding 3-year-old trotter of the year.

THOMAS V. HANEY.

**RADIO BROADCASTING.** The radio industry during 1946 completed its first year of reconversion from war service back to a peacetime basis. The four principal national networks, the National Broadcasting Company, Columbia Broadcasting System, American Broadcasting Company, and the Mutual Broadcasting System, maintained their long-established high standards of technical and program performance despite rising costs in talent, office, field, and engineering help.

The development of television broadcasting was rapid in the final months of the year after a rather slow start. Black and white television programs, notably NBC's presentation of the opening of the United Nations Assembly, the Louis-Conn fight, Columbia's *Sports Parade* broadcasts, and the Brooklyn Dodger baseball games, were among the features shown by the new art and industry and disclosed its infinite possibilities. Production of television receivers must be increased enormously in the months ahead to satisfy the public demand. The spectacular development of all-electronic simultaneous color television by the Radio Corporation of America in 1946 includes an adaptor which will enable black and white receivers to register an image even when it is transmitted in color.

During the year a considerable number of new AM Stations were licensed by the F.C.C. The growing number of FM Stations and in the near future those that may specialize in television, will increase competition among broadcasters. There was a healthy growth of station-affiliation with networks.

The *Welcome Home Auditions*, set up by NBC as a war project to give men and women veterans the opportunity to audition in music, drama, and announcing, concluded its operations as a separate unit on its second anniversary, October 9, 1946. Almost 16,000 veterans were interviewed, and more than 8,000 auditioned. Twenty-three percent of those who passed the auditions were given employment in some phase of radio.

The tenth American Exhibition of Educational

Radio Programs sponsored by Ohio State University's Institute for Education by Radio gave NBC three firsts and three honorable mentions.

The Columbia Workshop, a proving ground for new talent, ideas and techniques, returned to the air during 1946. A special CBS Documentary Unit, devoted exclusively to the production of programs dealing with major domestic and international issues and involving extraordinary research and preparation, was established during the year.

To keep the public abreast of contemporary events, CBS continued to maintain some 30 reporters and analysts at home and abroad.

The American Broadcasting Company network made radio history when on four consecutive evenings, men and women alternated in reading the powerful and dramatic text of John Hersey's "Hiroshima." This, as is well known, is the account, first published in *The New Yorker*, of the effect of the atom bomb on six persons who lived to tell about it.

The Mutual Broadcasting Company reported that it had devoted 5,827 hours to broadcasting for the year 1946. Musical programs led with a 36.3 percent of the full number of hours of broadcast time. Programs of a public service nature, whether sustaining or commercial, consumed 31 percent of the total broadcast time of the company.

Almost 34 million families own radios in the United States and the audience reaction to American radio is, for the most part, one of pleasure and satisfaction. In the past year there has been criticism of the "commercialism" of American broadcasting. The criticism, in some cases, would appear to have been stimulated by pressure groups and groups with a particular axe to grind.

In March, the Federal Communications Commission announced a new set of criteria by which the fitness of broadcasters to operate stations would be judged by the Commission when their licenses came up for renewal. This document, entitled *Public Service Responsibility of Broadcast Licensees*, became popularly known as the *Blue Book* and set the pattern for most of the criticism of radio.

The National Opinion Research Center of the University of Denver, under the auspices of the National Association of Broadcasters, conducted a survey in 1946. This survey is considered the most important effort in radio's history to calibrate the people's reaction to American broadcasting. The report was analyzed and interpreted by the Bureau of Applied Social Research, Columbia University, under the direction of Dr. Paul F. Lazarsfeld. Entitled *The People Look at Radio*, the 151-page volume disclosed that the public likes American radio, trusts it and places more faith in it than in newspapers or motion pictures. The survey pointed out radio's weaknesses, as listed by listeners, but concluded that radio's critics represent a minority.

There is evidence that the industry will continue the forward progress in 1947 that has characterized every year of its 26-year history.

NILES TRAMMELL.

**RAILROAD RETIREMENT BOARD.** An independent executive agency of the U.S. Government which administers a retirement system and an employment service system for railroad employees. For 1946 activities, see RAILWAYS. Chairman: William J. Kennedy.

**RAILWAYS.** The reconversion problem of the railways was nearly as difficult as that of the builder

of motor cars. While it is true that General Motors had to turn from making tanks and air plane engines to making Cadillacs and the Railways had merely to continue to transport freight and passengers the character and channels of peacetime traffic differed as much from wartime traffic as motor cars from tanks. The transportation of wheat from the Dakotas to the mills was radically different from moving war supplies from California to the Atlantic seaboard.

But reconversion, difficult as it was, seemed simple as compared with the rehabilitation problem cleared up by the railways in 1946.

There was not only the slack of the war years to be taken up. Maintenance of track, bridges, cars and locomotives had been inadequate since 1929. Seventeen years of under-maintenance is enough to put the best railway out of business. Lack of money was the cause of ten years paltry upkeep, lack of men and material in the following seven years left a poorly ballasted track, laid with badly worn rail over which to move worn-out cars.

However in 1946 there was not an unusually large number of accidents because enginemen and operating officers went beyond the line of duty to continue safe train movement at scheduled speeds. Thus enginemen whose duty it was merely to obey speed restrictions risked their jobs and often their lives in an effort to carry freight and passengers at what their individual judgments told them were safe speeds under conditions of the moment. It was a frame of mind that officers actually in charge of train movement had been trying to bring about for years.

Operating officers after spending a full day in their offices spent additional time suggesting and supervising makeshift repairs both to track and equipment. Even on roads where work was strictly separated by departments—the so-called departmental system of administration, like that on the New York Central—theories were followed in theory only. A European railway officer found the freedom from accidents under these conditions utterly inexplicable.

The fact that the work was not prescribed makes the compiling of figures impossible. That a vast amount of such work went on, however, is not guesswork. Individual accounts of what was done come from too many different sources. As for maintenance of way: In 1944 there were 144 tie renewals per mile, in 1945 there were 132. The comparatively small number of accidents in 1946 could be explained only by the temporary suspension of the law of chance or by extraordinary work on the part of enginemen and operating officers.

Early in 1946 a careful study was made of the freight car situation and it was estimated that 80,000 cars, divided between box, hopper, and gondola, ought to be taken out of service. This number represented less than 20 percent of these types of cars that were over 25 years old!

It was estimated (by the Railway Age) that the situation as regards passenger cars was no better than that in respect to freight cars.

As for motive power the case was not so bad. On May 1, 1946 of the total owned, 76 percent were in service, 15 percent were unserviceable and 8.5 percent were stored in serviceable condition. These were the reported figures. What is not contained in the figures is that for profitable operation more than half of all the locomotives owned are twenty years old, which means in the opinion of the great majority of operating officers that they can not be operated profitably in competition with the locomotives that are being built today.

**Wage Disputes.** On May 17 the President of the United States by executive order took "possession and control" of the railways of the continental United States. They were "taken and assumed through the director [J. Monroe Johnson] of the Office of Defense Transportation" who in turn appointed Charles H. Buford federal manager of the properties. Mr. Buford has been Executive Vice President of the Chicago, Milwaukee, St. Paul, and Pacific Railway and during the war was Vice President of the Association of American Railroads in charge of its Operations and Maintenance departments.

The order was signed in the presence of A. F. Whitney, President of the Brotherhood of Railroad Trainmen, and of Stanley Johnston, Grand Chief Engineer of the Brotherhood of Locomotive Engineers, who were at the White House to report on the failure of their latest conference with railway managers in regard to a strike of the two Brotherhoods for May 18.

The two Brotherhoods (unions) mentioned had originally demanded a 25 percent increase in pay with a minimum raise of \$2.50 per basic "day." An emergency "fact-finding" board appointed by the President had reported in favor of a 16 cents-an-hour increase in pay for the members of the B. of R.T. and of the B. of L.E. This finding had been rejected by the men and a strike had been called for May 18. The strike order was not rescinded immediately on the signing of the executive order taking control, but the next day five minutes before 4 p.m. (the time set for the walk out) President Truman announced that Whitney of the B. of R.T. and Johnston of the B. of L.E. had consented to postpone the strike until May 23. On that date the strike actually went into effect but was settled two days later by Whitney's and Johnston's accepting President Truman's compromise of a pay rise of 18½ cents per hour effective as from May 22. It is estimated that this will add 700 million dollars to railway wages. The three other operating employee unions and the fifteen nonoperating unions had already accepted the compromise suggested by the President. Acceptance by the B. of R.T. and the B. of L.E. came only a few minutes before President Truman went to Congress with a message asking authority "to draft into the armed forces of the United States all workers who are on strike against their Government." Government control of the railways was ended at 4 p.m. May 26.

**Capital Expenditures.** In the refinancing that had been done so cheaply (as noted in the 1945 YEAR BOOK) provision had been made by many of the railways for extensive capital expenditures in the immediate future. To many railway officers it seemed that the future of that form of transportation depended largely on the wisdom shown in 1946 development. A worn-out plant called for either replacement in kind or replacement with something different, but great caution was shown in actually doing anything. Where it was quite clear that improvement in some competitive service would result, changes were freely made in what had heretofore been considered standard practice. This was extended to freight service as well as passenger service.

The "Pacemaker Freight Service" on the New York Central is a striking example of new methods. The Pacemaker is a scheduled freight train running daily except Sundays and holidays between New York City and Buffalo, New York, a distance of 429 miles, and the time allowed is 10 hours and 50 minutes each way. The average speed is 39

miles an hour to be made despite stops to set off and pick up cars at Albany, Utica, Syracuse, and Rochester.

Even glamor is used in this railway attempt to compete with trucks. Cars and cabooses making up the Pacemaker are painted vermilion on the top portion of their bodies and dark gray on the bottom portions. The train consists of up to 75 cars, each with a capacity of 50,000 pounds. The cars are 40 feet 8 inches long and 9 feet 2 inches wide and 10 feet high inside. They are copper-bearing steel. The tare weight is 46,000 pounds, making a unit when fully loaded of 96,000 pounds. They are equipped with special pneumatic and foundation brakes and trucks cushioned against lateral and vertical shocks. In addition they have Waugmat Twin-Cushion draft gear having yokes pin-connected to the couplers so that the free slack usual in long freight trains is almost entirely eliminated. The attention to detail goes well beyond anything heretofore attempted in freight service on American railways. As an example: the caboose cars which were originally built with vertically beaded wood-sheathing have been covered, ends and sides, with  $\frac{1}{2}$  inch five-ply veneer cemented on and secured with drive screws, making them conform with the smooth exteriors of the steel-sheathed box cars.

What is notable in the 1946 developments is that the most striking of them was in freight service. Freight has for at least fifty years been the profitable part of American railway operation and it is in the movement of freight that the steam railway is most clearly superior to other forms of transportation. Passengers, mail, and express are side lines, necessary because the public demands them and because the capital in roadway is so very large that even a slight revenue from passengers and mail often keeps the railway company out of the red. Nevertheless the absolutely indispensable feature is freight. There were clear indications that this fact was recognized in 1946.

**Motive Power.** Diesel-Electric locomotives have proved themselves more satisfactory than steam engines as motive power for both freight and passenger trains but now the gas-turbine is receiving consideration because the operation of a 2,200 h.p. unit in Europe has shown economies as compared with what it is estimated a Diesel-Electric could do. The gas-turbine, built in 1941, was in use until the fall of 1945 on the Swiss Federal Railways and was then put in service in France on the run of 175 miles from Basle to Chaumont making a round trip a day. It is estimated that in the hauling of a seven-car passenger train the saving, as compared with a Diesel-Electric, is \$10,000 a year and would be greater with a longer, heavier train. The unit which the builders, Brown, Boveri and Co., suggest for American railways weighs 338,000 pounds, develops 2,500 h.p. and has a tractive force on starting of 55,000 lb. Its maximum speed is 90 miles an hour.

For switching service nothing yet built has proved as satisfactory as the Diesel-Electric. It is still claimed that in road service where grades are heavy and a large amount of traffic is carried electrification will give the most satisfactory service and the cheapest over a ten-year period.

**Stations.** There has been a quite bitter feeling heretofore against railways in rural regions because of the great disparity between stations in small towns and the monumental stations in the large cities. In building the station at Prince, West Virginia, the Chesapeake and Ohio Railway tried something unique. The station was opened June 26.

The Prince station is only 125 feet long and 22 feet wide but down to the smallest detail it is fastidiously handsome. For instance the waiting room which is 55 feet by 22 feet is 17 feet high with a large part of the wall space taken up by plate glass windows. The ceiling is sound-absorbing, the six wooden benches are streamlined and have plastic-fabric back cushions. There is an electrically-cooled drinking fountain. There is a ladies' lounge in this small town station! There is radiant heating and ultra-violet ray lamps to improve sanitary conditions.

In sharpest contrast to this small station built in the United States is the experimental small-station design which has been developed by the London, Midland and Scottish for use in England. The underlying motive in the design of the American station was to get something that was pleasing to the users of a local railway station. The underlying motive in the English station was to get something that could be quickly built and could be maintained with a minimum of labor. The English station is factory-made from its foundation to its roof. The foundation consists of pre-cast concrete units which include heating and drainage pipes. On the foundation are erected steel columns, which support continuous roof and canopy beams. The roof consists of a series of shallow timber units which are very light and the under side forms a smooth ceiling ready for painting. The top of the roof is covered with bituminous felt in built-up form.

The building can be insulated by the insertion of a glass silk quilt in the space between the outer enameled plates and the inner wood lining. Although designed for speed in erection the building has a very pleasing appearance.

**Through Coast-to-Coast Passenger Service.** Various reasons have been suggested as to why there has heretofore been no through-Chicago passenger service. Among the more plausible reasons is the unwillingness of any eastern road to tie itself up in an exclusive alliance with one of the western roads. It was thought to be an advantage to be free to bargain for an interchange of passenger as well as freight traffic. At long last, on March 31, 1946, coast-to-coast sleeping car service was begun with an all room sleeping car leaving New York on the New York Central's Twentieth Century Limited and transferred to the Atchison, Topeka and Santa Fe's *Chief*. Thus a passenger could leave New York at 5:30 Monday afternoon, pass through Chicago on Tuesday morning and arrive at Los Angeles at 11:50 a.m. on Thursday all without changing cars. The coast-to-coast trip takes more than 69 hours.

Also on March 31 the Pennsylvania Railroad in connection with the A.T. and S.F. had a through car to Los Angeles and in connection with the Chicago and Northwestern and the Union Pacific a second car to Los Angeles and in addition a car to San Francisco via the Chicago and Northwestern, the Union Pacific and the Southern Pacific. The cars to both Los Angeles and San Francisco run daily each way.

In June a through Pullman car service between New York and Los Angeles was established by the Southern Pacific in connection with the Chicago, Rock Island and Pacific, and the Pennsylvania Railroad.

On March 31 the Baltimore and Ohio in connection with the Atchison, Topeka and Santa Fe began a through Pullman car (bed-roomette) service daily between Washington, D.C., and Los Angeles, Cal.

About that time President White of the Baltimore and Ohio was quoted as saying that negotiations were going on for a through sleeping car to points in the southwest via St. Louis.

Implied in the establishment of these services is the thought, in connection with airplane competition for passengers, that railways can increase the comfort of travel to more advantage than the speed of travel. While this thought is most dramatically shown by the cars through St. Louis and Chicago it was expressed in a great many other ways. Heretofore advertising had been relied on to "sell" individual railway's service to the public. Now there is a concerted effort being made to render the railways' services enjoyable. Air conditioning and adjustable seats in day coaches were not new but the extent of their use was greatly broadened.

**Railroad Retirement Board.** Making railway work attractive to capable men is even more fundamental to satisfactory service than making railway passenger transportation attractive to travelers, but the most notable work done in that respect in 1946 was done by a Government board although some individual railway officers worked powerfully towards that end. Since 1936 the Railroad Retirement Board has administered the payment of old age pensions, disability, and death benefits and unemployment allowances. In 1946 amendments were made to the Railroad Retirement and Railroad Unemployment Insurance Acts which increased from 3½ percent to 5¼ percent the tax on earnings, with a like tax on employers' pay rolls. However, to quote the Monthly Review of the Board: "No additional rate of contributions for unemployment insurance is levied on employers since the present rate of 3 percent of taxable pay roll, coupled with the reserve in the railroad unemployment insurance account, is considered sufficient to meet all costs arising from the amended Railroad Unemployment Insurance Act for an indefinite period in the future."

The amendments institute the payment of benefits for sickness on a like basis to those for unemployment. Rhode Island and California have had workers' sickness-benefit laws, but this one for railway employees is the first federal law of its kind. Under the old law, benefits for those earning \$2,000 to \$2,500 were at the rate of \$4 a day. This has been raised to \$4.50 a day for those earning \$2,000 and \$5 a day for those earning \$2,500. Maternity is included. The Government benefits are in addition to any benefits the employee may be receiving from fraternal or group insurance but not from Government under the Social Security Act. The payments to railway employees are about 25 percent higher than they would receive under the Federal Social Security Act. The amendments extend benefits from 100 to 130 days.

**Rates.** On December 6 the Interstate Commerce Commission gave its approval for a general increase in freight rates by rail and water carriers. It was estimated by the *New York Times* that the increase averaged 17.6 percent. The case had been before the I.C.C. since April 15 when the railways had asked for approval of an increase of freight rates of 25 percent. On June 20 the Commission gave its approval to an "emergency" increase which averaged 6.5 percent. The decision in December superseded the one in June. That is, the increase was not in addition to that allowed in June. Back in 1942 an increase of 10 percent had been allowed on passenger fares limited to six months after the formal end of the war. In December this increase was extended indefinitely.

The figures given as averages are mere approximations when it comes to making an estimate of how much additional revenue will be brought in. As to just how much freight will move under a given rate only time will show. About all that can be said is that the railways have proved to the satisfaction of the Interstate Commerce Commission that their wages, cost of materials, and taxes have increased by about a billion since 1939 and the Commission has approved increases in freight rates that, together with the 10 percent increase in passenger fares, will add about a billion dollars to railway revenue.

**Financial Standing.** Even before the decision had been rendered the standing of the railways as bidders for investment funds had improved greatly. Of course large war earnings helped and the cheap refinancing that had been done in 1945 advertised railway securities. On the day following the I.C.C. decision the market price of rail stocks improved some but not sensationally. On December 7 Pennsylvania Railroad stock paying \$1.50 per 50-dollar par value share closed on the New York Stock Exchange at 28. At that price the dividend yield is slightly under 5.4 percent per year. On the same day the closing price of American Telephone and Telegraph yielded the buyer slightly over 5.4 percent per year and U.S. Steel common paying 4 percent on 100 dollars par value sold to yield 5.5. In other words the financial standing of one of the soundest railroads compared favorably with U.S. Steel and with the premier public utility.

**Reorganization.** On August 1 the Seaboard Air Line which had been in receivership since December 1930 was taken over by the reorganized S.A.L. Railroad. The set-up of the new company had been approved by the I.C.C. in June and finally 97 percent of old security holders agreed to the plan. This reflected the extent of the confidence in the ability of steam railways to compete successfully with buses and airplanes. The Seaboard Air Line having trackage rights from New York to Richmond, Virginia, and its own line from there to the southern part of Florida is subject to exceptional competition from both buses and airplanes. Its most profitable passenger business is that of well-to-do people going between New York and Florida winter resorts. Airplane travel has a strong appeal. Its most profitable freight traffic is in fresh fruit and vegetables from Florida to New York, a type of freight for which airplanes are very well fitted. Florida has a comprehensive network of bus lines. It is true that in recent years there has been an unusually large development of pulp, paper, and textile mills along the lines of the S.A.L.; still reorganization has hung fire for sixteen years.

**Financial Results.** In the first ten months of 1946 the railways in the United States earned a total of \$6,332,000,000 comparing with a total of \$7,624,000,000 earned in the first ten months of 1945. The comparison is for ten months only because at the time of going to press no reasonably accurate estimate could be made of the earnings and expenses of November and December 1946.

Of the total in 1946 there was earned from passengers, \$1,081,000,000, which compares with \$1,410,000,000 earned from passengers, in 1945. The comparison for freight is \$4,770,000,000 in 1946 and \$5,665,000,000 in 1945. The percentage of decrease is greater in passenger earnings because freight earnings in 1946 included some "interim" rate increases that the I.C.C. had granted.

Total operating expenses in the first ten months of 1946 amounted to \$5,272,000,000 and to \$5,538,-

000,000 in the first ten months of the previous year. Breaking up expenses: \$965,000,000 was spent for maintenance of fixed property in 1946 comparing with \$1,112,000,000 in 1945. There was \$1,221,000,000 spent for maintenance of rolling stock in 1946 comparing with \$1,535,000,000 in the first ten months of 1945. Transportation of which the largest items are trainmen's wages and fuel cost, in the first ten months of 1946, \$2,649,000,000 and in the first ten months of 1945, \$2,500,000,000.

Relevant to expenses is the fact that railway payrolls in 1946 were \$4,200,000,000, the greatest in history according to Dr. J. H. Parmelee writing in the *Railway Age*. The average number of men employed on railways was only 1,380,000 in 1946 as compared with 1,420,000 in 1945. The higher payrolls were due to wage increases.

Taxes were, in 1946, well below the war years. They were \$483,000,000 as compared with \$1,106,000,000 in 1945, and \$1,587,000,000 in 1944, as compared with \$1,000,000,000 in 1943.

The railways as a whole did a little better than earn enough net to meet their fixed charges in the first ten months of 1946. The final net available for stock in 1946 was \$155,000,000 which compares with \$473,000,000 in 1945.

**Operating Results.** The revenue ton miles carried in 1946 was 583,000,000,000 comparing with 681,000,000,000 in 1945. The revenue passenger miles carried in 1946 was 65,000,000,000 comparing with 91,717,000,000 in 1945.

Average train load of revenue freight is often used as a measure of efficient railway operation but a change in character of traffic which is outside the control of the operating department also affects train loading. Iron ore loads are heavier than grain despite anything operating officers can do. In the first ten months of 1946 the average net train load was 1,084 tons. In 1945 it was 1,129 tons. Less than car load freight tonnage (merchandise) increased 1946 as compared with 1945 by 14.2 percent. Ore tonnage decreased 16.6 percent and coal tonnage decreased by 4.5 percent. Ton miles per freight train hour averaged 17,178 in 1946 and 17,482 in 1945.

Towards the very last of 1946 a serious car shortage developed which railway men had been expecting.

The following figures were compiled by *Railway Age*.

**Car and Locomotive Orders.** There were 57,781 freight cars ordered by railways, for domestic use, in 1946. This compares with 38,255 in 1945. There were 41,752 delivered in 1946 as compared with 43,864 delivered in 1945.

There were 1,930 passenger train cars ordered for domestic use in 1946 comparing with 2,998 ordered in 1945. There were delivered 1,331 in 1946 and 856 in 1945.

There were 919 locomotives ordered in 1946 and 845 ordered in 1945. Of those ordered in 1946 55 were steam, 856 were Diesel and 8 were electric. Of those ordered in the previous year 148 were steam, 691 were Diesel and 6 were electric.

There were 690 locomotives built, for domestic use, in 1946 and 935 in 1945.

**New Lines Built.** A total of 68 miles of new first track were completed in 1946, comparing with 65 miles completed the year before. In each of the years 1866 to 1914 more than a thousand miles of first track were built; in 1888 7,066 miles were built.

The longest (1) piece of line built in 1946 was from Floris, Iowa to Centerville, 34.53 miles. It was built by the Chicago, Rock Island and Pacific.

There was much line-revision work and 14 bridges were renewed—the work on five of these costing more than a million dollars each.

There were 423 miles of line abandoned. The longest piece was 68 miles in Wisconsin.

**Receiverships.** No railways were put in receivers' hands in 1946 but at the end of the year 36,044 miles were in receivers' or trustees' hands. The reorganization of the Seaboard Air Line was commented upon earlier in this article.

**Dividends.** In May the New York Central omitted the fifty-cents-a-share dividend which had been declared in May in the three previous years. The Southern Pacific increased its annual dividend rate from 3 to 4 percent.

Anti-trust suits brought by the Department of Justice against the Association of American Railroads and The Western Association of Railways are still before the courts. A bill of particulars has been filed by the government and has been answered by the railways.

WILLIAM E. HOOPER.

**RAPID TRANSIT.** Problems of providing adequate, speedy, efficient and economical means of rapid transit or local transportation in large communities remain to be solved. The discouraging financial factors are in ever-increasing operating expenses, insistent labor demands, and the difficulties in getting increased rates or fares to accord with mounting expenses. In spite of the return to peace conditions the traffic of 1945 continued high. This unexpectedly good record, in place of the predicted drop at the end of restrictions on the production and use of automobiles, is attributed by the American Transit Association to the quick shifting of industry to peace conditions, and to the actual reduced production of automobiles. These conditions carried over into and through 1946.

The total number of passengers carried in 1945 was above all previous records, 23,254,000,000, compared with 23,017,000,000 in 1944. The earning power, however, continued to fall, because of higher operating expenses. Although reduced taxation partly offset this loss, the earnings were 8 percent below the 1944 figure. The passenger record would have been higher, but for the numerous strikes and interruptions to traffic.

Many transit companies had plans for modernizing and rehabilitation in the postwar period, but these met with delays and difficulties, especially in procuring materials and equipment. Not much has been done in the way of stations and terminals, but there have been plans for off-street terminals for the convenience of passengers and street traffic. Most companies have planned expansion of motor-bus and trolley-bus service, and some of the smaller concerns have proposed conversion of street-railways to bus lines, but street railways still carry the bulk of the traffic. The Chicago street railway system (three companies) has an improvement program calling for the expenditure of \$23,000,000. Atlanta, Georgia, proposes conversion of its street-car lines to bus service, with a central terminal station and an outside parking place with transportation to and from the station. Subways are planned in several cities, for improved speed and service and reduced traffic congestion. But in view of the difficulties and cost of construction the outlook for such works is not favorable. However, Chicago has resumed work on its second subway line, from the north side to the business district and then west to the river. This had been halted in 1942.

Total trackage of street-car lines has declined from 40,510 miles in 1926 to 16,480 miles in 1945,

while bus routes have increased from 36,900 to 90,400 miles. However the surface railway lines in 1945 carried 40 percent of the passengers; subway and elevated lines, 12; motor-bus lines, 43, and trolley-bus lines, 5 percent. These figures cover electric street railways, elevated and subway lines, and local bus lines. Not included are taxicabs, suburban railways, sight-seeing buses and school buses.

At the end of 1945, there were 1,253 operating companies, of which 172 were street railway lines (91 urban surface lines, 5 electric subway and elevated lines, and 76 interurban lines). Trolley and motor-bus lines together numbered 1,209. In length of routes, the electric railway lines had 9,212 miles (of which 382 miles were subways or elevated lines); trolley-bus lines, 1,211 miles, and motor-bus lines, 39,500 miles.

Equipment comprised 26,680 surface railway cars, 1,075 elevated and subway cars, 3,716 trolley buses, and 49,670 motor buses. Operating revenue for all lines was \$1,380,400,000, but operating expenses amounted to 77.31 percent of revenue. Total number of passengers carried equaled 23,254,000,000, distributed as follows: surface railways, 9,426,000,000; subways and elevated lines, 2,698,000,000; trolley buses, 1,244,000,000; motor buses, 9,986,000,000. Total employees numbered 242,000, for a pay roll of \$632,000,000. The riding habit of the public increases directly with population, ranging from 126 revenue rides per capita per annum in cities between 25,000 and 50,000, up to 428 rides per capita in cities of more than a million population.

Municipal rapid-transit service is confined mainly to ownership of subway and elevated lines, which are leased for operation to local companies. There are 29 municipally owned systems, operating 1,231 miles of route (or first main track), 2,200 miles of motor-bus lines, and 100 miles of trolley-bus lines. Besides the above, some cities have combined municipal and company ownership. In Boston, a substantial part of the local system is owned either by the city or the State, and the stockholders of the company have a guaranteed return of 5 percent. In Chicago, the Rapid Transit Co. (elevated lines) began operating the State St. municipal subway, 4.83 miles, in October, 1943. In Newark, N.J., the city owns the 4.23-mile subway, for street cars and buses, operated under lease by the Public Service Transport Co. Philadelphia owns 48 miles of the 67-mile subway and elevated lines operated by the Philadelphia Transportation Co. under lease. In Rochester, N.Y., the 9.20-mile subway (with 24 miles of track) is owned by the city and operated by the Rochester Transit Co.; it is separate from the rest of the system, which consists of bus service.

At Montreal, Canada, subways have been proposed, but a less expensive alternative for the relief of traffic congestion is to provide surface expressways having two 2-lane roadways separated by a double-track electric railway. Toronto has plans for a subway system, but meanwhile has built an off-street bus terminal. In Australia, Sydney (New South Wales) expected to begin work in 1946 on a 7-mile extension of the subway system, and Melbourne (Victoria) is planning subways. In South America, Rio de Janeiro (Brazil) plans a municipal subway, and Santiago (Chile) proposes a subway, partly open cut, as traffic is hopelessly congested in a maze of narrow winding streets. Russia is reported as building a subway at Kiev, and a 12-mile extension of the Moscow subway, making a total of 40 miles for Moscow.

Among serious problems in the transit industry

are the revision of fares, public relations, financial situations, the labor outlook and traffic congestion. While the public is quick to ask for improvements, which may be costly, it usually opposes increase in fares. The American Transit Association plans research on the relation of fares to service, and on the improvement of local public relations with the transit industry. While the automobile has created and is still promoting the habit of travel, it is thought to have neared its peak as a competitive factor in the handling of local traffic. It is being recognized also that the local traffic system will play a large part in solving the problem of street traffic congestion. Since automobiles average barely two passengers, it is evident that these two occupy a considerable stretch of the traffic lane, as compared with the passengers in a bus or street car. In one city a survey showed that on an average day the traffic entering the business district was classed as follows: 146,900 persons in 85,283 automobiles, and 173,000 persons in 5,129 public transit vehicles.

E. E. RUSSELL TRATMAN.

**RECIPROCITY INFORMATION, Committee for.** A committee created under the provisions of Section 4 of the Trade Agreements Act of June 12, 1934, which provides that before a trade agreement is concluded with any foreign government interested persons shall have an opportunity to present views to the President or to such an agency as the President may designate. The Committee was created as such an agency, and in 1936 its functions were extended to include receipt of statements with reference to any aspect of the trade agreements program. In 1939 it was placed under the jurisdiction of the Department of State. The agencies and departments represented in the membership have changed from time to time.

**RECLAMATION, Bureau of.** A bureau of the U.S. Department of the Interior, which conducts multipurpose irrigation projects in 17 western States. The work of the Bureau covers production of food and electric energy, furnishing of municipal and industrial water, provision for flood control, river regulation, and aid in the preservation of fish and wildlife.

With 57 projects in operation, construction work was scheduled on 30 more, including the Missouri River Basin Development, authorized by the Flood Control Act of 1944; additional work on Grand Coulee Dam; the Central Valley Project in California; and Lewis Dam. Crops valued at approximately \$411,000,000 were produced in 1944 on projects watered by Reclamation systems. Commissioner, 1946: Michael W. Straus.

**RECONSTRUCTION FINANCE CORPORATION (RFC).** RFC's activities during 1946 fell into three broad categories. They pertained (1) to lending; (2) to liquidating as many RFC-conducted war activities as practicable, while continuing those which could not be terminated without harmful effects on post-war production and employment; and (3) assisting, by the use of RFC's facilities, in the establishment of a sound and enduring postwar economy, with emphasis principally on providing credit aids in cooperation with banks, to small business enterprises and veterans, and on helping to restore American trade with occupied and liberated countries.

Under powers conferred upon it by the RFC Act, approved January 22, 1932, and by subsequent legislation, the Corporation has extended financial assistance to almost every type and size of industrial

and business enterprise, as well as to other Federal agencies, and to State and local agencies.

As of June 30, 1946, RFC loans and authorizations for all purposes amounted to \$41,230,936,765.84, of which \$1,943,162,824.17 was outstanding.

Lending activities of The RFC Mortgage Company during 1946 included the authorization of loans on income-producing urban real estate, and the extension of loans to finance new construction of the same type. The Company also provided a market for veterans' home loans guaranteed or insured by the Veterans Administration. Another RFC subsidiary, the Federal National Mortgage Association, during 1946 continued to purchase first mortgages insured by the Federal Housing Administration.

The functions of the four wartime subsidiaries of RFC, dissolved on June 30, 1945, were continued by RFC. These former subsidiaries were the Defense Plant Corporation, Defense Supplies Corporation, Metals Reserve Company and Rubber Reserve Company.

tional requirement of 732,000 tons of synthetic rubber during the fiscal year ending June 30, 1947. The rubber program contemplated keeping six plants, costing \$142,000,000, in stand-by condition during the fiscal year and eight plants, costing approximately \$16,000,000, were expected to be declared surplus for disposal.

Through its subsidiary, U.S. Commercial Company, RFC negotiated agreements with the War Department under which merchandise from Germany and Japan was imported, the objective being, first, to create dollar exchange in those countries in amounts sufficient to help pay for their essential imports, thereby alleviating the burden on American taxpayers defraying the expenses of military occupation, and, second, to foster reestablishment of United States foreign trade.

On June 5, 1946, RFC organized a Small Business Division to deal with credit problems of small business, and to assist small business in buying Government-owned surplus property.

On March 23, 1946, RFC and its subsidiary, War Assets Corporation, since dissolved, trans-

RECONSTRUCTION FINANCE CORPORATION  
SUMMARY OF LOAN & PURCHASE ACTIVITIES, FEBRUARY 2, 1932 THROUGH JUNE 30, 1946

	Authorizations	Disbursements	Repayments and Other Reductions
For benefit of agriculture . . . . .	\$ 2,603,733,430 83	\$ 1,452,180,464 11	\$ 1,452,000,775 45
To open banks to meet demands of depositors . . . . .	1,334,880,161 08	1,138,251,619 27	1,127,825,604 83

\* Includes \$7,050,698,299 91 representing credits arising from the merger of R F C war affiliates with R.F.C. under Public Law 109-79th Congress

\* Includes \$2,785,458,704 21 of Corporation's notes canceled pursuant to Act of Congress approved February 24, 1938.

RFC's plant program of rapid but orderly liquidation involved contract termination, close-down, plant protection and maintenance, and declaration of plants and equipment, no longer needed for war work, as surplus and therefore available for sale or lease by War Assets Administration. Of the more than 2,200 projects, for which authorizations aggregating approximately \$8,468,000,000 were made, it was expected that the program would be completed on June 30, 1947, except for projects not released by sponsoring agencies. A number of defense supplies programs, including payment of food subsidies, were terminated during 1946. Procurement of some commodities in critical supply, such as quinine, cinchona products, hard fibers, molasses and goatskins, was continued. The purchase was also continued, under the metals program, of certain critically needed metals, principally tin and tin ores and concentrates, copper, lead and antimony. Thirty-seven synthetic rubber plants, costing approximately \$506,000,000, were continued in operation to produce an estimated na-

ferred certain personnel and assets to the War Assets Administration which, starting March 25, 1946, succeeded RFC as the disposal agency for approximately 90 percent of all Government-owned property declared surplus.

CHARLES B. HENDERSON.

**RED CROSS, American National.** Conversion to peacetime activities has characterized all American Red Cross services during 1946. Continuing its work with the armed forces, the organization maintained a reduced staff, about 3,200 to serve overseas troops, while 4,400 were assigned to domestic service. Under a new agreement effective July 1, 1946, all club facilities overseas are Army-sponsored, but professional recreation personnel continues to be furnished by the Red Cross without salary charge to the Army. At the end of the fiscal year, 1946, about 130 on-post and off-post recreation facilities were being operated by Red Cross club workers in the European theater of operations, while 153 recreation centers were in operation in the Far East.

The Mediterranean theater was served by 35 recreation centers, the Pacific Ocean areas were served by 10, and independent stations such as Alaska and the Canal Zone were allotted 26. Appropriations by Red Cross for such recreational programs during the fiscal year 1946-47 amount to \$16,272,000.

Approximately 1,350,000 members of Red Cross volunteer Special Services donated more than 120,000,000 hours of service during the past year in the following corps: Administration, Arts and Skills, Canteen, Home Service, Hospital and Recreation, Motor, Production, Staff Assistance, Dietitian's Aide, and Nurse's Aide. The Dietitian's Aide Corps was discontinued June 30, 1946. Camp and Hospital Council Service, which was a wartime service, became on July 1, 1946, a part of the peacetime structure of the Red Cross under the name, Community Service to Camps and Hospitals. Through 52,100 organizations affiliated with this service, 5,000,000 volunteers have given recreational and other services to able-bodied and hospitalized servicemen and veterans.

More than \$11,635,000 was spent during 1945-46 on Red Cross chapter assistance to Army and Navy personnel and their dependents. From April 1945 to March 1946, emergency furlough verifications, handled through Home Service departments of chapters, numbered 1,630,000. According to reports of June 30, 1946, approximately 1,700,000 veterans had been given Red Cross assistance at the time of their separation from service. Red Cross field directors serve in 62 Veterans Administration regional offices, 10 branch offices and 79 Veterans Administration hospitals, with a total of more than 800 paid Red Cross workers engaged in Veterans Administration programs. The Red Cross received an average of 30,000 powers of attorney per month during 1946 from veterans, and assisted them in filing applications for benefits and assembling supporting evidence.

In its overseas emergency relief program from July 1, 1945 to June 30, 1946, the American Red Cross made available approximately \$50,000,000 worth of chapter-produced clothing, medical and hospital supplies, supplementary food and milk, and automotive equipment. In the period from September 1, 1939 to June 30, 1946, the organization distributed more than \$152,000,000 worth of supplies to more than 75 million persons including 27 million children in 49 countries.

Assistance in 271 disasters in 45 states and Alaska was given during 1945-46, when more than 136,000 persons received aid consisting of food, clothing, medical and nursing care, and temporary shelter. Aid also was given in Hawaii to 6,350 victims who survived a tidal wave. Total expenditures for disaster relief at home and in insular possessions was \$1,604,985.

More than 337,000 Americans received first aid certificates and 400,000 completed water safety training courses during the past fiscal year. More than 27,000 volunteer instructors are teaching first aid in the United States, and during the year, the First Aid, Water Safety, and Accident Prevention Service had 10,000 mobile first aid units and 2,000 highway first aid stations in operation. Classes are given regularly in home nursing and nutrition.

The American Junior Red Cross during the past year contributed about \$1,850,000 worth of educational, health, and recreational supplies to children overseas. At present the membership of Junior Red Cross numbers nearly 20,000,000 young people of school age. Red Cross college units number 187.

Distribution of more than 735,000 units of sur-

plus blood plasma was made during the past year to hospitals throughout the United States, Alaska, Hawaii, and the Philippine Islands. The Red Cross civilian Blood Donor Service, inaugurated as a national project in 1945, is expanding steadily so that free emergency supplies will be continually available.

Basil O'Connor is national chairman of the American Red Cross; the ex-officio president is Harry S. Truman, President of the United States.

**REFUGEES.** The problem of refugees and displaced persons was under continuous discussion in bodies of the United Nations during 1946; convincing evidence of its urgency as a political, economic, and social question requiring a high degree of international cooperation in its treatment. It was generally accepted that the continued presence in assembly centers in Germany and Austria of 1,000,000 refugees and displaced persons constituted an irritant in the relations of friendly governments and served to delay the restoration of peace and order in Europe.

The great majority of these persons were unwilling to return to their countries of origin, because they could not accept the political changes in their home countries which had resulted from the war. Some undoubtedly were motivated in their reluctance to return by preference for the security, shelter, and food provided in the assembly centers as compared with the hardships of life in the home countries: Poland, Yugoslavia, and the Ukraine.

These countries of origin of the displaced persons in which the destruction caused by the war had been extensive were inclined to question the good faith of their nationals who were unwilling to return home to share the burdens of reconstruction, and suspected them of political opposition to the regimes in power. Concerned with man-power shortages at home they were unwilling to agree that any of their nationals should emigrate as settlers to countries overseas.

In contrast to this point of view, the western occupying authorities in Germany and Austria—the United States, France, and the United Kingdom—were unwilling to force this hard core of non-repatriables to return to their home countries against their will. These authorities recognized the right of the individuals concerned to a free choice with respect to return and their right to hold political opinions freely and to express them.

This conflict in political ideologies predominated throughout the discussions on the subject in the United Nations. At the meeting of the General Assembly of the United Nations in London in January, 1946, the principle was unanimously adopted that no person who, after receiving information directly from representatives of his country of origin, was unwilling, for valid reasons, to return to his country should be obliged to do so. It was also agreed that such persons should become the concern of such international body as might be established to care for them, and the Economic and Social Council was directed to establish a sub-committee to explore the problem in all of its aspects and to propose the constitution and budget of an international body which might assume responsibility for the problem.

The persons envisaged as the possible concern of the proposed International Refugee Organization were those remaining in Germany, Austria, and Italy of the 8,500,000 United Nations nationals who had been drawn into Central Europe by the Germans as slave laborers or victims of concentration camps during the war. In 1945, some 7,000,000

of these hapless persons had been repatriated to their countries of origin by the Allied military authorities from the western occupied zones of Germany by train, truck, and plane. Many had trekked homeward on foot. This homeward movement which had exceeded all expectations in 1945 had come to a standstill in the winter months of 1945-46.

Although repatriation was encouraged and facilitated by the military authorities and the United Nations Relief and Rehabilitation Administration in the spring and summer of 1946, it became evident in the fall of 1946 that the expected hard core of non-repatriables had finally emerged in terms of 1,000,000 persons who were unwilling to return. These consisted chiefly of 600,000 Poles; 150,000 to 200,000 Baltic nationals—Latvians, Lithuanians, and Estonians—75,000 to 100,000 Yugoslavs; 50,000 Ukrainians, and approximately 200,000 Jewish refugees, mostly Polish Jews, who had left Poland after the cessation of hostilities. These latter included not only those who had survived Nazi persecutions in Poland during the war, but some of the 150,000 Polish Jews who had returned from the Soviet Union to Poland under the Polish-Soviet Agreement with respect to the exchange of populations concluded in Moscow in 1945. They left Poland because of the insecurity which they felt in that country and because of an emotional and religious drive to reach Palestine as their national home.

The Anglo-American Commission of Inquiry which had been established by the British and United States Governments in December, 1945, reported a series of recommendations with respect to Palestine in April, 1946. One of these recommendations was that 100,000 Jewish refugees then housed in displaced persons centers in Germany and Austria should be admitted to Palestine immediately.

The British Government was unwilling to act on this recommendation alone without reference to action on other recommendations of the Commission which had to do with the political and economic reorganization of Palestine. As a consequence, the Polish Jews who had reached Central Europe still found themselves at the end of 1946 awaiting final decisions on Palestine which appeared to be more remote than ever.

There were certain groups of refugees and displaced persons in the Far East which were also envisaged as the concern of the proposed International Refugee Organization. Approximately 15,000 Central European refugees, mostly German and Austrian Jews, had survived the war in Shanghai. The Far East offered no opportunities for them and they earnestly desired emigration to Australia or the western hemisphere or repatriation to Germany or Austria. By the end of 1946 some 1,500 had been assisted to join relatives in Australia, and 500 had secured immigration visas to the United States. UNRRA and private relief agencies had assisted to maintain them since the end of the war.

UNRRA also reported progress at the end of the year in the repatriation of over 5,000 overseas Chinese from China to their pre-war domiciles in Burma, Singapore, Siam, and Indo-China. Some 35,000 others remained in China awaiting repatriation to the same areas in 1947. During the year, approximately 100,000 Chinese had returned to Hong Kong by foot.

In Italy, the numbers of refugees and displaced persons had been reduced to approximately 150,000 during 1946 by the demobilization of the Anders Polish Army and the removal of its former

members to England. There they were placed as civilians in training camps to prepare for resettlement in overseas countries. The British Government announced in September, 1946, that it would accept responsibility unilaterally for the care and ultimate disposition of this group which, including wives and children, numbered 200,000. The refugees and displaced persons remaining in Italy were predominantly Yugoslavs unwilling to return to Yugoslavia. Included in the total at the end of the year however were approximately 25,000 Polish Jews enroute to Palestine.

The position of the displaced persons in Germany was worsened during the year by the arrival in Germany of over 6,000,000 former German residents of Poland, Czechoslovakia, and Hungary under the terms of the Potsdam Agreement. The occupying authorities in Germany, already concerned with the dislocations of the German population in Germany, were ill prepared to receive this new movement of Germans which added substantial burdens to the German economy and greatly increased the demand for housing which was already far below the existing requirements. However, the emotional and political pressures in Poland and Czechoslovakia to expel these Germans from the liberated homelands were too great to be resisted on grounds of the resulting discomfort to Germans within Germany.

The overcrowding within Germany made it impossible however for the occupying authorities to give relief to Denmark which, at the end of 1946, was still caring for 200,000 Germans who could not be returned to Germany. These were the remnants of the westward movement of Germans in flight from the advancing Soviet armies in the spring of 1945. They constituted a heavy burden on Denmark from which she desperately sought relief.

The United Nations Relief and Rehabilitation Administration at the meeting of its Council in August, 1946, in Geneva, voted to discontinue operations on behalf of displaced persons by June 30, 1947. This action was taken on the assumption that the International Refugee Organization, which was finally accepted by the General Assembly of the United Nations by a vote of 30-5 at its meeting in New York in December, 1946, would be in a position to assume responsibility for the problem by that time. The action of the General Assembly opened the constitution, including the budget of \$160,000,000, of the International Refugee Organization to signature by the government members of the United Nations. The organization will come into effective operation when fifteen governments, whose total contributions constitute 75% of the budget, have signed the constitution thus indicating their willingness to afford the organization the necessary financial support.

The Intergovernmental Committee on Refugees, established by the Evian Conference called by President Franklin D. Roosevelt in 1938, which in July, 1946, expanded its functions to include that of facilitating the emigration and resettlement of non-repatriable displaced persons, also voted at its plenary meeting in London in December, 1946, to turn over its responsibilities and assets to the International Refugee Organization as soon as that body was prepared to function.

GEORGE L. WARREN.

**RELIGIOUS ORGANIZATIONS.** Church membership in the United States numbered 72,492,669 persons, the largest total in the nation's history, according to the 1945 *Yearbook of American Churches*, pub-

lished under the auspices of the Federal Council of the Churches of Christ in America. This total comprises 52.5 percent of the July 1, 1944 population of 138,100,874 persons (Bureau of Census estimate). Of the total, 97.4 percent are reported in the 55 religious bodies having 50,000 or more members, with the remaining 2.6 percent of the membership found in 201 other bodies.

The majority of the total religious membership is absorbed by three religious groups: Protestant bodies over 50,000—41,943,104 members, Roman Catholic Church—23,419,701 members, and Jewish Congregations—4,641,184 members.

Contributions in gifts and bequests to religion in 1942, the latest survey, reached \$720,800,000, as estimated by the Department of Commerce.

For further information on the larger denominations, see separate articles furnished by an official of each; FEDERAL COUNCIL OF THE CHURCHES OF CHRIST AND JEWISH WELFARE BOARD.

**REPARATIONS. Germany.** The basic program of the United States and its Allies for the satisfaction of their reparation claims against defeated Germany is contained in two complementary agreements—the tripartite Potsdam Agreement of August 2, 1945 and the 18-power Paris Agreement on Reparation of January 14, 1946 resulting from the Paris Conference on Reparation.

At the Potsdam Conference the Governments of the United States, the Union of Soviet Socialist Republics, and the United Kingdom agreed upon the principles of a plan for the exaction of reparation which formed an integral part of a coordinated Allied political and economic policy toward Germany. The World War I conception of reparation as the maximum obtainable financial compensation in fixed sums of money for the staggering costs of war to the Allies was abandoned. According to John B. Howard, special advisor to James W. Angell, U.S. representative on the Allied Commission on Reparations for Germany, the application of this conception had actually transferred much of the real burden of German reparation to the Allies, in the form of repudiated loans. Instead, the Potsdam Agreement established two major new principles. First, it was agreed that the primary objective should be the establishment of military and economic security against renewed German aggression, not the maximizing of reparation receipts. Second, it was agreed that reparations should be paid by Germany in kind, rather than in cash, the payment in kind to be made out of such German assets as would, if left under German control, constitute an economic base for future aggression by Germany but would, if received as reparation, hasten the economic recovery of the United Nations. The total amount and duration of reparation and, to some extent, the character of the reparation assets to be made available by Germany were not fixed in advance but were made dependent upon subsequent determinations to be reached by the Control Council for Germany with respect to the establishment of the German economy on a peaceful basis.

Agreement was also reached at Potsdam upon a plan for the division of German reparation assets between the Union of Soviet Socialist Republics and Poland, on the one hand, and the United States, the United Kingdom, and other countries entitled to reparation, on the other hand. Under this plan and subsequent decisions the principal assets out of which the reparation claims of the countries in the latter group are to be satisfied include:

1. German enemy assets within the jurisdiction of these countries.

2. German external assets within the countries which remained neutral in the war against Germany.

3. 75 percent of the industrial capital equipment to be removed from the western zones of Germany. Of the 25 percent which is to be allocated to the U.S.S.R. and Poland, 10 percent represents reparation to these countries and 15 percent is to be paid for by the U.S.S.R. in food, raw materials, and other products.

4. Two thirds of the German merchant marine. The Potsdam Agreement provided for equal distribution of the surrendered German merchant marine among the U.S.S.R., United States, and United Kingdom. It provided further that the U.S.S.R. would provide out of its share for Poland and that the United States and United Kingdom would provide, from their shares, appropriate amounts for other Allied countries whose merchant marines have suffered heavy losses in the war against Germany. The ships allocated to the United States and United Kingdom, in accordance with their respective one-third shares, have been made available by these countries to the Inter-Allied Reparation Agency, referred to below, for distribution by the Agency among the 18 member governments in accordance with the principles of allocation established in the Paris Agreement.

5. The commodities to be delivered by the Union of Soviet Socialist Republics (referred to hereafter as Russian reciprocal deliveries) in exchange for receipt of 15 percent of the industrial capital equipment to be removed from the western zones of Germany.

At the Paris Conference on Reparation the governing principles and the mechanism were established for the division of these reparation assets among the 18 governments which participated in the conference. Arrangements are under consideration whereby certain other governments which are entitled to receive reparation from Germany and which did not participate in the conference will meet their reparation claims from German external assets within their several jurisdictions.

Several major results were achieved by the Paris Conference and by the Paris Agreement:

1. Agreement was reached among the 18 governments on their respective shares in all assets available to these governments collectively as reparation from Germany.

In the establishment of reparation shares the Paris Conference was guided by the principle, agreed upon at the Yalta Conference of February 1945, that reparation from Germany should be received in the first instance by those countries which have borne the main burden of the war, have suffered the heaviest losses, and have organized victory over the enemy. The sum total of claims for direct damage, war expenditures, and occupation costs alone amounted to almost \$300 billion, an amount obviously tremendously in excess of the total value of any probable available German reparation assets.

This statistical data necessarily provided much of the basis for determining the relative sizes of the reparation shares of the several countries. The reparation shares agreed upon assign separate percentage shares to each government in two different categories of reparation assets. One category, designated A, includes all reparation assets except industrial and other capital equipment removed from Germany and merchant ships and inland water transport. The latter types of assets comprise the other category, designated B. These percentage shares are listed in the table on page 545.

The reparation receipts to which the United States is entitled, as a consequence of its percentage shares as shown above and of the special provisions of the Paris Agreement applying to German external assets and to receipts of German merchant ships, may be summarized as follows:

(a) All German external assets within the jurisdiction of the United States, estimated at some \$200 million;

(b) 28 percent of German external assets in neutral countries;

(c) A share of German merchant shipping proportionate to the relative tonnage losses of the United States;

(d) 11.8 percent of industrial and other capital equipment removed from the western zones of Germany and made available to the governments participating in the Paris Conference; and

(e) 28 percent of the value of all other German assets made available for reparation to these governments, including such assets as Russian reciprocal deliveries.

Country	Percentage Share	
	Category A	Category B
Albania	0 05	0 35
United States of America	28 00	11 80
Australia	0 70	0 95
Belgium	2 70	4 50
Canada	3 50	1 50
Denmark	0 25	0 35
Egypt	0 05	0 20
France	16 00	22 80
United Kingdom	28 00	27 80
Greece	2 70	4 35
India	2 00	2 90
Luxembourg	0 15	0 40
Norway	1 30	1 90
New Zealand	0 40	0 60
Netherlands	3 40	5 60
Czechoslovakia	3 00	4 30
Union of South Africa	0 70	0 10
Yugoslavia	6 60	9 60
	100 00	100 00

At the Paris Conference the United States did not claim so large a percentage share of industrial equipment as of other types of reparation assets. This decision was based on the fact that the early receipt of such equipment is especially important to the war-devastated countries of Europe, whereas the United States, as a capital exporting nation, has only a limited interest in such equipment. The share of the United States is large enough to cover equipment which may be removed from Germany as reparation in which there are private American pre-war financial interests of a substantial character, and also to make possible the receipt of a relatively small volume of special items likely to be desired by the United States and its nationals. Canada and the Union of South Africa likewise decided at the Paris Conference not to claim so large a share of industrial equipment as of other types of reparation assets.

**United States Zone.** The work that is now going on in the U.S. Zone was actually begun at Yalta early in February, 1945. There, the Chiefs of State of the United States, United Kingdom, and the Union of Soviet Socialist Republics declared their inflexible purpose to destroy German militarism and to eliminate or control all German industry that could be used for military production. They also agreed on the principle that Germany should make compensation in kind, to the greatest extent possible, for the damage and destruction inflicted on the Allied countries during the war.

At Potsdam, between July 17 and August 2, 1945, the same Three Powers spelled out the Declaration of Yalta in terms of a definite program, which included: (1) Elimination of the facilities for, and prohibition of the production of, arms, ammunition, and implements of war as well as all types of aircraft and seagoing ships. (2) Destruction of the German war potential by removal of industrial capital equipment from the heavy industries, principally metals, machinery and chemicals.

The Potsdam Declaration also provided that, during the period of occupation, Germany should be treated as a single economic unit, with common policies in regard to economic life and reparation removals. To implement this provision, central German administrative departments were to be established for finance, transport, communications, foreign trade and industry. Such departments were

to be headed by State Secretaries and act under the direction of the Control Council.

Between JCS 1067 and the Reparations Agreement of March, 1946, the U.S. military government launched one of the greatest industrial hide-and-seek operations on record. There was no complete, easy-to-be-had list of Nazi war facilities. They were scattered throughout the length and breadth of Hitler's Germany—inside mountains, in forests, below the ground, on isolated beaches, and in hosts of small shops and plants that were never designed explicitly for war production. An economic hunt was called for.

Since the summer of 1945, Military Government has been sifting, screening, and reviewing a list of hundreds of reputed German war plants in the U.S. Zone. Work on this list, which represents a pool of Army-Navy-Air Force data, is now almost complete. In all, the number of plants so considered—and which will either be available for reparations or retained for the German economy—runs into the thousands.

On May 4 the U.S. Deputy Military Governor gave instructions to stop further dismantling of reparations plants in the U.S. Zone except for those 24 plants allocated as "advance reparations" and war explosives plants on which work was already under way. This policy was adopted pending definite assurance that the provisions for treating Germany as an economic unit as specified in the Potsdam Declaration and the Reparations Plan will actually be put into effect.

The established level of industry for Germany is based on the existing plant capacity of all four zones. Plants considered for reparations and removal are war-potential plants and plants not required to maintain the established level of industry. Until such time as Germany is treated as a single economic unit it is necessary that plants now scheduled for reparations or removal be retained in each of the industrial fields to supplement the capacity originally anticipated from the other zones.

The Potsdam agreement provides that during the period of occupation Germany shall be treated as an economic unit; that allied controls shall be imposed on the German economy only to the extent necessary to ensure equitable distribution of German commodities as between the several zones in order to produce a balance economy throughout Germany and reduce the need of imports, that certain specified German central departments be created to assure the administration of these controls.

This policy was modified on June 28, when all plants in the U.S. Zone officially classified as "war plants" (those engaged exclusively in production of materials primarily used for war) were released for destruction and/or dismantling. The total so classified in the U.S. Zone at that time was 98 plants, of which 69 had been either completely dismantled and/or destroyed or such work was under way. The remaining 48 plants are now to be dismantled or destroyed, thus again throwing into high gear the industrial demilitarization program in the U.S. Zone.

Approximately 17,000 persons in the U.S. Zone are working on one or another phase of reparations activity—destruction, dismantling, shipping, evaluation, administration, statistics.

As of Aug. 1, 1946, 156 plants in the U.S. Zone had been confirmed for reparations by the Economic Directorate. Industries represented include aircraft, armaments, chemicals, machinery, metals, oil, and shipbuilding.

Of the 156 plants "confirmed," 24 were allocated as "advance reparations" in October, 1945. These allocations were made in conjunction with a swift appraisal (The basic clauses of the evaluation formula agreed by the Coordinating Committee of the Allied Control Council on January 7, 1946: Plant and equipment shall be evaluated at 1938 replacement cost, in Reichsmarks, without taking into account delivery and installation expenses. War damage, if any, will be deducted and depreciation allowed at rates to be agreed upon, subject to a multiplier of 1.35 for every year of war use. Maximum allowance deductible for war damage and depreciation will be 78 percent of the 1938 cost and will be applied to the unit of allocation as determined by the Economic Directorate of the Allied Control Authority.) of the plants, known as "Operation RAP." This represented an attempt to make available in the shortest possible time a number of reparations plants to the Soviet Union and the Western Nations.

Dismantling of these plants began immediately and, as of July 1, six of the 24 plants had been completely dismantled.

On March 31, 1946, the first shipment of reparations equipment—from the huge Kugelfischer ball-bearing plant at Schweinfurt—was loaded on rail cars and forwarded to Bremen, there to be transhipped to the Soviet Union. Since then, reparations equipment has been forwarded to Bremen from three other plants. Daimler-Benz Underground Aircraft Engine Plant, Deschmag Shipyards, and Gendorf Power Plant.

As of August 1, 11,000 tons of reparations equipment from these plants, all representing "Advance deliveries" were made available at the port of Bremen for transshipment by water to the U.S.S.R. Shipments totalling 9,092 tons of equipment have been made from the port of Bremen to the Soviet Union.

The destruction of war plants—those engaged exclusively in the production of materials primarily used for war—is part and parcel of the reparations program. After removing general-purpose equipment, power plants, etc., for reparations, such facilities are destroyed. As of July 1, 69 war plants in the U S Zone had been dismantled and/or destroyed, or in process of such treatment.

**Japan.** During 1946 the reparations program for Japan was under constant discussion by the Far Eastern Commission, but no specific measures were reached by all concerned powers.

The first specific designation of properties to be considered for reparations was made on January 20, 1946. A directive, issued by Gen. Douglas A. MacArthur, Supreme Commander for the Allied Powers, listed aircraft factories, military and naval arsenals and research laboratories to be placed under SCAP custody and control. Their protection and maintenance was made a responsibility of the Japanese Government. Additions and deletions to the list have been made from time to time and it now contains 504 installations.

SCAP directives of August 13, 1946 placed under custody 505 plants in eight industrial categories. All privately-owned munitions plants were listed for reparations. In the seven other industrial fields the Japanese were allowed to retain capacities essential to the minimum economy of the country.

For discussions on reparations in the Allied Council and the United States recommendations, see the article on JAPAN. Also see GERMANY, MILITARY GOVERNMENT, PARIS PEACE CONFERENCE, UNION OF SOVIET SOCIALIST REPUBLICS.

During the Paris Peace Conference reparations claims were established against Italy, Rumania, Finland, and Bulgaria. Following are pertinent excerpts from the draft treaties and revisions adopted in later Conference discussions.

#### Italy.

##### A. Reparation for the U.S.S.R.

1 Italy shall pay the Soviet Union reparation in the amount of \$100,000,000 over a period of seven years from the date of the coming into force of the treaty. Deliveries from the current industrial production shall not be made during the first two years.

##### 2 Reparations shall be made from the following sources

(a) A share of the Italian factory and tool equipment designed for the manufacture of war implements which is not required by the permitted military establishments and is not readily susceptible of conversion to civilian purposes.

(b) Italian assets in Rumania, Bulgaria, and Hungary, subject to some exceptions.

##### (c) Italian current industrial production

3 The quantities and types of goods to be delivered shall be the subject of agreements between the Italian Government and the Government of the U.S.S.R. and shall be selected and deliveries scheduled in such a way as to avoid interference with the economic reconstruction of Italy and the imposition of additional liabilities on other Allied or Associated Powers. Agreements concluded under this paragraph shall be communicated to the four Ambassadors in Rome of the U.S.S.R., U.K., U.S.A. and France.

4 The U.S.S.R. shall furnish to Italy on commercial terms the materials which are normally imported into Italy and which are needed for the production of these goods. Payments for these materials shall be made by deducting the value of the materials furnished from the value of the goods delivered to the U.S.S.R.

5 The four Ambassadors shall determine the value of the Italian assets to be transferred to the U.S.S.R.

In the final sessions of the Conference, it was agreed that Italy should pay a total of \$325,000,000 to the Soviet Union, Yugoslavia, Greece, and Ethiopia.

#### Rumania.

Losses caused to the Soviet Union by military operations and by the occupation by Rumania of Soviet territory will be made good by Rumanians to the Soviet Union, but taking into consideration that Rumania has not only withdrawn from the war against the United Nations, but has declared and, in fact, waged war against Germany, it is agreed that compensation for the above losses will be made by Rumania not in full but only in part, namely to the amount of 300,000,000 United States dollars payable over eight years from Sept. 12, 1944, in commodities—oil products, grain, timber, seagoing and river craft, sundry machinery, etc.

The basis for calculating the settlement provided for in this Article will be the United States dollar at its gold parity on the day of the signing of the Armistice Agreement, i.e., 35 dollars for one ounce of gold.

The Conference agreed that the \$300,000,000 should be divided among the Soviet Union, Yugoslavia, and Czechoslovakia.

#### Finland.

Losses caused to the Soviet Union by military operations and by the occupation by Finland of Soviet territory will be made good by Finland to the Soviet Union, but taking into consideration that Finland has not only withdrawn from the war against the United Nations but has declared war on Germany and assisted with her forces in driving German troops out of Finland, the parties agree that compensation for the above losses will be made by Finland not in full, but only in part, namely to the amount of 300,000,000 United States dollars payable over eight years as from Sept. 19, 1944, in commodities—timber products, paper, cellulose, seagoing and river craft, sundry machinery, etc.

The basis for calculation for the payment of indemnity will be the United States dollar at its gold parity on the day of the signing of the armistice agreement, i.e., \$35 for one ounce of gold.

Finland, in so far as she has not yet done so, undertakes within the time limits indicated by the Government of the U.S.S.R. to return to the Soviet Union in complete good order all valuables and materials removed from its territory during the war, and belonging to state, public and co-operative organizations, enterprises, institutions or individual citizens, such as factory and works equipment, loco-

motives, rolling stock, tractors, motor vehicles, historic monuments, museum valuables and any other property.

No revisions were made to these clauses.

### Bulgaria.

Losses caused to Yugoslavia and Greece by military operations and by the occupation by Bulgaria of the territory of those states will be indemnified by Bulgaria to Yugoslavia and Greece, but, taking into consideration that Bulgaria has not only withdrawn from the war against the United Nations, but has declared and in fact waged war against Germany, the parties agree that compensation for the above losses will be made by Bulgaria not in full but only in part, namely to the amount of 125,000,000 United States dollars

### Hungary.

Losses caused to the Soviet Union, Czechoslovakia and Yugoslavia by military operations and by the occupation by Hungary of the territories of these States will be indemnified by Hungary to the Soviet Union, Czechoslovakia and Yugoslavia, but taking into consideration that Hungary has not only withdrawn from the war against the United Nations but has also declared war on Germany, the parties agree that compensation for the above losses will be made by Hungary not in full but only in part, namely to the amount of 300,000,000 United States dollars, payable over eight years from Jan. 20, 1945, in commodities (machine equipment, river craft, grain, etc. . . .), the sum to be paid to the Soviet Union to amount to 200,000,000 United States dollars, and the sum to be paid to Czechoslovakia and Yugoslavia to amount to 100,000,000 United States dollars

The basis for calculating the settlement provided for in this Article will be the American dollar at its gold parity on the day of the signing of the armistice agreement, i e, \$35 for one ounce of gold.

**REPRESENTATIVES, U.S.** The following list by States of the members of the House of Representatives, 80th Congress, convening in 1947, was taken from the official list compiled by South Trimble, Clerk of the House. The numbers preceding the names indicate Congressional districts, those appearing without numbers being Representatives at Large. Other facts indicated in the type are as follows:

Republicans in roman (246); Democrats in *italic* (188); American Labor in SMALL CAPS (1); total 435. Those marked \* served in the Seventy-ninth Congress, those marked † served in a previous Congress. Predecessors of incoming Members in brackets [ ].

\* Popular Democrat. Appointed Sept. 11, 1946, to fill the vacancy in the term ending Jan. 3, 1949, caused by the resignation of Jesús T. Piñero, Sept. 2, 1946.

**RÉUNION.** A Department of France, 420 miles east of Madagascar. On March 14, 1946, the status of Réunion was changed from a colony to a department, effective January 1, 1947. Area, 970 square miles; population (1941), 220,955. Chief towns: St. Denis (capital), 32,637 inhabitants (1941); St. Paul, 23,055; St. Louis, 20,867; St. Pierre, 20,150. Pointe-des-Galets is the main port. Education (1941): 245 schools and 22,900 pupils. The chief products are sugar, rum, manioc, coffee, vanilla, and spices. Trade (1944). Imports 258,560,000 francs, exports 138,705,000 francs. Governor: Jean Capagorry.

**REYNOLDS FOUNDATION, Inc., Z. Smith.** A foundation established in 1936 for charitable and civic purposes within the State of North Carolina by the brother and sisters of Zachary Smith Reynolds, deceased. The income from the beginning of the foundation has been used primarily for a campaign to control venereal disease in the State. Annual grants have been made to the North Carolina State Health Department for this purpose. The contribution for 1946, as in 1945, was \$200,000. The book value of the principal of the Trust, as of June 30, 1946, was \$10,182,695.85, which was a little less than its approximate market value. The Trustees are W. N. Reynolds, President; Richard J. Reynolds, Mary Reynolds Babcock, Nancy Reynolds Bagley, Charles H. Babcock, Henry W. Bagley, L. D. Long, W. R. Hubner. Secretary, Stratton Coyner, Winston-Salem 3, North Carolina.

**RHODESIA, Northern.** A British protectorate in southern Africa, grouped with British Central Africa territories. Area, 290,320 square miles. Population (1943 estimate), 1,385,386. Capital, Lusaka. The protectorate is administered by a governor with the aid of an executive council and a legislative council. The terrain is mostly high plateau country and mineral products (copper, zinc, cobalt, vanadium, lead, mica, gold, and silver) are the important resources. Some agriculture is carried on, with maize, tobacco, wheat, and cattle as the chief products of the land.

**RHODESIA, Southern.** A British self-governing colony in southern Africa, grouped with British Central Africa territories. Area, 150,333 square miles. Population (1941), 1,453,000. Capital, Salisbury. The colony has a responsible government, headed by a governor who is assisted by an executive council and a legislative council of 30 members. The latter is elected for a five-year term by British sub-

jects over 21 years of age, subject to certain qualifications. The constitution limits the powers of the legislative council with respect to appropriation and taxation bills.

The results of the election, which were announced at the end of April, showed that the United Party had lost its clear majority in the legislative council of 30, but remained the largest party. The United Party secured 13 seats, the Liberals 12, the Rhodesia Labor Party 3 and the Southern Rhodesia Labor Party 2. Sir Godfrey Huggins, the United Party prime minister, said that results meant that his government should be continued.

The products of the soil are diversified and economically important. Cattle, sheep, pigs, tobacco, citrus fruits, and dairy produce are high on the list. Mine products include gold, asbestos, chrome ore, tungsten, and tin. Secondary industries reported a wage bill of £3,270,000 in 1932, a rise of 43 percent over 1938. The country's import trade has always been predominantly with the United Kingdom, with the Union of South Africa second; but the United Kingdom's share dropped from 45 percent in 1939 to 37 percent in 1944. Outside the Empire the United States was by far the most important source of supply, with an increase from 10 percent in 1939 to 16 percent in 1944. Exports of £15,803,088 in 1944 exceeded imports by £3,836,456. Governor and Commander in Chief, Admiral Sir Campbell Tait, appointed in 1944.

**ROADS AND STREETS.** Road construction in the United States dropped during the war years from 12,936 miles in 1941 to 4,011 in 1945, and then took a sharp fall to 2,964 miles for the fiscal year ending with June, 1946. It included 991 miles of the Federal-aid road system, 294 of secondary or farm-to-market roads, 1,673 of access roads to war factories and plants, and 6 miles of miscellaneous construction. In addition, 29 grade crossings were eliminated. The total cost for all completed work was \$103,812,655, of which \$76,448,942 (74 percent), was paid by the Federal government.

Plans were approved for 11,450 miles to be built in 1946-47. Much of the existing system needs to be overhauled and improved or rebuilt, having been damaged by heavy loads and heavy traffic, while at the same time repair and maintenance were of necessity neglected. The return to active construction has not been as rapid as expected, owing to shortage of labor and to such economic conditions as high prices, shortage of materials and equipment, and problems of labor and wages.

Of the total 334,534 miles of public road, 22,944 are unsurfaced. The surfacing of 311,590 miles is approximately as follows: soil surfaced, 3,050 miles; gravel or stone, 50,644 miles; various bituminous compositions, 150,508; bituminous concrete and slag, 22,752; cement concrete, 81,024 miles; brick, 1,390 miles. In accordance with the increasing speed and volume of traffic on the main roads, more attention is being given to the effective lighting of such roads, in the interest of safety and convenience. In September, President Truman appointed a committee on highway safety, composed of representatives of various Federal departments and bureaus. Another important line of study is the decrease in speed and loss of time of heavily loaded trucks on steep gradients.

In preparation for postwar work, Congress passed a law in 1944 authorizing \$500,000,000 annually for the first three years to assist the States in highway improvement. It also required the designation of a national interstate highway system of not more than 40,000 miles, by joint action of the

State highway departments and the Federal Public Roads Administration. With the uncertainties of prices and supplies, bids for road construction naturally tended to increase, thus limiting the amount of work that could be done for funds available. In many cases bids have been rejected as too high.

An important development is the extension of major highway routes through cities in the form of expressways, as the most serious traffic problems are in and near cities. Such thoroughfares are not the responsibility of the cities alone but are links in the general highway system, for which reason the government is now sharing in their costs to the extent of \$125,000,000 in 1946, in 1947, and in 1948. Many difficult problems are involved, especially in limiting access to these high-speed streets. There are also by-pass or circumferential roads, to enable

through traffic to keep out of cities, and these are planned to total 5,000 miles of the interstate highway system, as definitely mapped out in 1946. In that year also progress was made by county, State, and Federal authorities in planning the authorized system of secondary or farm-to-market roads, all integrated with the interstate system of main roads.

Bridge work is an increasingly large part of highway work, as the number of bridges is enormous, and many of them are not adapted to carry such loads as are now imposed upon the roads. Grade separation works involve bridges for both railways and roads. Another auxiliary work is in the landscaping of the roads and the provision of rest areas and safety turnouts. Of immediate necessity is the renewal of maintenance work on the roads, for the benefit of the paving and for the riding comfort.

\* For states which did not segregate buses from other vehicles, the segregation of buses from other vehicles has, where possible, been approximated from other data available. <sup>b</sup> Taxicabs included with trucks. <sup>c</sup> Taxicabs and rentals included with buses.

<sup>d</sup> Includes the proceeds of the regular 3 cents per gallon motor-fuel tax and the 1 cent "liquid fuels tax" which applies to practically the same gallonage. Liquid fuels tax collected on gallonage to which regular motor-fuel tax was not applicable (\$7,000 in 1945) is not included.

Supplementary to maintenance is the clearing of ice and snow from the public roads, and there is increasing activity in a policy of keeping the roads open throughout the winter. In May, 1946, a highway safety conference was held in Washington. A survey of trucking traffic showed that the average load per truck increased from 3.6 tons in 1941 to 4.8 tons in 1945, while the frequency of heavy wheel loads also increased.

Surveys have been made also as to traffic capacity of city streets, in the interests of smooth and easy traffic movements combined with safety. The capacity seems to be about 600 to 700 vehicles per lane per hour, easily lowered to 400 by heavy cross traffic. But on an expressway, the figures may be 1,200 to 1,500 vehicles per lane per hour. More attention is being given to the matter of safety, and more is needed, as shown by the terrible records of traffic accidents. Divided lanes are a safety factor, as they prevent head-on collisions. But traffic and speed continue to increase. Accident prevention covers the mechanical condition of the vehicles, regulations and their enforcement, education of drivers, design of road and its paving, and the provision of adequate signs and lighting.

Practically every State and city has projects and plans for road and street improvement. As examples, California proposes relocation of the Bay Shore highway as a 6-lane freeway from San Francisco, having two 52-ft. roadways with a 20-ft. dividing strip. Illinois plans a high-speed road along the Mississippi River, as part of a 2,500-mile route paralleling the river. Ohio plans a 295-mile toll road across the State as an extension of the Pennsylvania Turnpike to the Indiana line, and serving Cleveland and Toledo. The New Jersey authorities plan a state-wide system of parkways connecting with New York City, and free from railroad crossings and drawbridges. In New York State, contracts have been let for the first sections of the 6-lane, 480-mile freeway from New York City to Buffalo and the Pennsylvania line, but the State has dropped its plan to make this a toll road.

Cities which plan urban expressways include Fort Wayne, Baltimore, Indianapolis, Atlanta, and Los Angeles, which is to have a four-level grade separation structure. Chicago has voted bonds for superhighways in the city and Cook County. Street work continues to be largely a matter of maintenance and repair of paving, together with the planning of new developments. However, attention is being given to prompt removal of snow and the mechanical sweeping and collection of leaves from the streets. Research includes extensive studies of soils and soil conditions as related to paving practice and materials.

Developments on the proposed road through Central and South America are of a limited and piecemeal character in the several countries to be traversed. The 3,300-mile Inter-American Highway from Laredo, Texas, to Panama City was pushed actively while German submarines were a hazard for shipping routes to the Panama Canal, but with that hazard removed the work has slowed down. Still less work has been done on the longer route from Panama City to Buenos Aires, 6,500 miles, with its great distances and physical difficulties. A group of oil companies in Venezuela have combined to build a 200-mile road from new oil districts to the port of Barcelona.

Mexico is improving its road system. Canada has taken over that part of the Alaskan Highway within its territory, as agreed when the United States built the road. But trucks in U.S. commerce are allowed to go through in bond. There is a limited

bus service, but tourist traffic is not encouraged, as there are few filling stations, rest houses, or other facilities. Other road projects in Canada include a 380-mile road from Grimshaw, Alberta, to the new gold fields on Great Slave Lake, and from Quibell, Ontario, north to the Red Lake mining district.

In Europe, road and street work is largely in clearing wreckage and making repairs, much permanent work being deferred for conferences over city planning and highway planning. The controversy in England over freight handling by road and railway has been closed by the mutual adoption of regulations, and the government has withdrawn certain restrictions on long-distance trucking. The present socialist government, however, plans to take over the railways, road traffic, and inland and coastal navigation. As to London, the government's Ministry of Planning has suggested that its revised street system should be designed to carry double the prewar traffic.

One project in France is a 150-mile high-speed road between Paris and Lille, having two 2-lane roads with a 25-ft. separating strip. In 1946, Switzerland completed the first motor road built across the Alps, 30 miles in length and utilizing the Susten pass. It rises from a 2,000-foot elevation to a summit elevation of 7,000 feet in a tunnel and then drops to 4,200 feet. Maximum grades are 8 percent, and minimum curves have a 60-foot radius. Both Russia and China are reported to have ambitious plans for highway systems.

E. E. RUSSELL TRATMAN.

**ROCKEFELLER FOUNDATION, The.** Chartered in 1913 for the permanent purpose of "promoting the well-being of mankind throughout the world." The present program of the Foundation is concerned with the extension and application of knowledge in certain definite fields of the medical, natural, and social sciences, the humanities, and public health. Except to a limited extent in public health, the Foundation is not an operating organization. Its activities are confined to the support of other agencies and to the training, through postdoctoral fellowships, of competent personnel in the various fields of knowledge.

In the field of medical science the Foundation's interest centers mainly on research and teaching in the sphere of nervous and mental diseases and on the improvement of medical services. Its appropriations in 1946 for work along these lines included \$89,100 to Tavistock Clinic, London, for research and teaching in psychiatry; grants to the University of Cambridge for research in neurophysiology (\$60,750) and in psychology (\$44,550); \$50,000 to McGill University for research in brain chemistry; \$18,200 to the University of Zurich for research in nervous and mental diseases; \$15,000 for graduate teaching in psychiatry under the supervision of the Director of the Neuropsychiatry Consultants Division of the Office of the Surgeon General of the Army Service Forces; \$22,275 to the University of London for research in problems of human heredity; grants for research in endocrinology to Columbia University (\$30,000), McGill University (\$30,000), and the Massachusetts General Hospital (\$12,000); \$78,500 to the National Health Council for a program in the coordination of voluntary health agencies; \$10,000 to the University of Michigan for the expenses of holding an institute for teachers of preventive medicine.

In the natural sciences the program is concerned chiefly with experimental biology. Appropriations in 1946 included \$150,000 to Eidgenössische Tech-

nische Hochschule, Zurich, for research in organic chemistry; \$50,000 to the California Institute of Technology for combined programs in biology and chemistry; \$30,000 to Washington University, St. Louis, for research in experimental embryology and general physiology; \$19,000 to the University of Oxford for research in antibiotics; \$25,000 to Duke University for research on the chemical and physicochemical properties of proteins; to the Centre National de la Recherche Scientifique (Paris) \$250,000 for allocation to about 35 of the leading natural science laboratories of France for special equipment, and \$100,000 for the expenses of attendance of non-French European scientists at a series of small conferences at French institutions; \$50,000 to the National Academy of Sciences (Washington, D.C.) for underwriting, up to one half, the expenses of delegates from various foreign countries to meetings sponsored by the Academy and the American Philosophical Society; \$100,000 to the Massachusetts Institute of Technology for a study of electronic computation.

In the social sciences, studies of international relations, and postwar problems receive major emphasis. Some of the 1946 appropriations included \$300,000 to Stanford University toward the preparation of an international history of food and agriculture during World War II; \$173,000 to the Pacific Council of the Institute of Pacific Relations for research and general expenses; \$139,000 to the Council on Foreign Relations (New York) for a history of foreign relations during World War II; \$75,000 to Brookings Institution for research in international relations; \$72,700 to the University of Minnesota for research on intergovernmental relations; \$70,000 to the Geneva Institute of International Studies for its general budget; \$42,500 to the Canadian Institute of International Affairs for its budget; \$33,750 to the Institute of International Affairs (Stockholm) for research and popular education in international problems; \$82,500 to Miami University (Ohio) for studies of population redistribution in the United States, \$58,500 to the University of Wisconsin for research in housing; \$43,800 to Yale University for a study of labor market structure and wage determination; \$10,000 to the University of Pennsylvania for a study of war experience in labor relations; \$16,177 to the United Nations Information Office (New York) toward the cost of reproducing the documentation of the Preparatory Commission and of the session of the First General Assembly of the United Nations.

In the field of the humanities assistance is given to programs which tend to raise the general cultural level and to promote cultural interchange between countries. In 1946 the American Council of Learned Societies received \$250,000 for its general support, \$150,000 for fellowships in the humanities, and \$35,000 for the use of its Pacific Coast Committee for aid to work in the humanities along the Pacific Coast; \$75,000 was granted to the University of Wisconsin for the development of a program of research and teaching on the materials of American civilization; \$25,000 to Northwestern University for teaching and field studies in American culture; \$33,000 to the University of Oslo for the development of work in the humanities; \$200,000 to Stanford University for the support of the Hoover Institute for Slavonic studies; \$42,500 to Princeton University for Near Eastern studies; \$12,200 to the University of Stockholm for the development of Far Eastern studies in Sweden, Norway, and Denmark; \$30,000 to the American Library Association for interchange of library personnel and materials by its International Relations

Board; \$9,000 to the Ministry of Public Education of Guatemala toward the development of the National Archeological Museum.

The Foundation appropriated \$2,200,000 for public health work by its International Health Division in 1946. This work included research on a number of diseases, among them malaria, typhus fever, yellow fever, influenza, diphtheria, and syphilis; demonstrations in the control of certain diseases in their environments; studies in nutrition and mental hygiene; cooperation with governments in the organization or improvement of important services of central or local health departments; and the development of public health education.

From the time of its establishment, until December 31, 1945, the Foundation expended a total of \$351,055,791.53. Its assets, as of December 31, 1945, were \$147,064,222.

The president of the Foundation is Raymond B. Fosdick; the secretary, Norma S. Thompson. The offices are at 49 West 49th Street, New York 20, New York.

**ROCKETRY AND JET PROPULSION.** Development of jet propulsion power plants of both the gas turbine and rocket types was pursued with vigor on both sides of the Atlantic in 1946. From the nature of the designs which made their appearance during the year it was apparent that, although they followed the same basic principle, they reflected many variations in type, and it was difficult to determine any specific trends.

Fundamentally the gas turbine consists of a compressor and turbine which drives it, the turbine being driven by compressed and heated gases. Power not needed to drive the compressor may be exhausted as a jet or applied to a propeller shaft or both in almost any desired proportion. The efficiency of a gas turbine system is the product of the efficiencies of the compressor and turbine. An increase in either yields a high increase in overall efficiency. It was toward the development of higher compressor efficiencies that most design effort was directed in the types appearing in 1946.

In earlier years of gas turbine development, British thought tended toward centrifugal compressors, although Air Commodore Whittle's original patent application included an axial flow stage or two to secure complete coverage. Early German designs were of the axial flow type. In America, General Electric pioneered the centrifugal, and Westinghouse the axial flow compressors.

But 1946 designs found General Electric trying axial flow compressors in its T G series and revealed that British manufacturers had been thinking in the same terms, finding combinations of both axial and centrifugal types, improving centrifugal types by double impellers, and even adding heat exchangers to their design. All these developments represent the continuous search for greater efficiency. They also mean that the gas turbine is becoming a more complicated mechanism but still less so than the reciprocating type of power plant.

Several design groups became tremendously interested in the possibility of compounding piston engines and gas turbines and much thought was given to this ramification of power plant design. Studies of various combinations showed gratifying increases in overall power output obtainable by utilizing the energy wasted in the piston engine exhaust through the use of a turbine. The power now wasted in exhaust gases can be used by way of a turbine to drive accessories which consume appreciable amounts of engine output or it may be returned directly to the crankshaft.

So attractive has become the possibility of compound engines that many designers now believe that large reciprocating engines will not be entirely replaced by gas turbine power plants in the years that lie ahead. As piston engines grow larger and operate at higher pressures the advantages of compounding are greatly magnified. Future large engines may well be of this type.

It is unlikely that there ever will be an ultimate engine. So many different tasks must be performed by so many types of aircraft that there probably will be work for which each type, or combination of types, is most efficient.

Jet engine production fluctuated monthly during the year but in September, 88 engines of this type were manufactured, having a combined thrust of 352,000 lb. The 132 reciprocating engines made during that month aggregated only 227,000 h.p.

Much design effort was expended in 1946 toward the development of aircraft using gas turbines of various types and toward the adaptation of existing reciprocating engine installations to turbojets, turboprops and other turbine types. An analysis of new Army Air Force contracts early in November showed that, of 41 types on order, only one fighter and very few bombers were to be powered by reciprocating engines. The Navy Bureau of Aeronautics, however, had only two jet fighters and one jet-reciprocating bomber on order, although other jet types were under contemplation by the Navy at that time.

Among the Army jet planes on order are: Lockheed, P-80 Shooting Stars and P-90 jet-rocket fighter; Consolidated, P-92, a sonic speed rocket powered plane and B-46 jet bomber; North American, P-86 jet fighter and B-45 jet bomber; Republic, P-91 rocket powered sonic speed plane; McDonnell, P-88 and P-85 jet fighters, the latter designed to be carried in the B-36 bomber; Northrop, P-89 jet fighter and B-49, a jet version of the B-35 flying wing, Curtiss-Wright, P-87 jet fighter and XC-113, a project version of the C-46 transport; Boeing, B-47 jet bomber; and Martin, B-48 jet bomber. Among the Navy jet planes on order were the McDonnell Phantom FD-1 and FD-2 and a jet-reciprocating bomber by Martin.

Design studies of future transport aircraft revealed important possibilities in turbine powered transport planes. A plane of this type powered by four Rolls-Royce Derwent V engines, developing 14,000 lb of thrust, was among those projected. This 40-passenger machine would have a gross weight of 52,500 lb. Such a plane could fly non-stop from New York to Chicago in 1 hr. 45 min.; with one stop from New York to Miami in 3 hr. 20 min.; and with two stops from New York to Los Angeles in 5 hr 55 min. Operating cost for this hypothetical plane was calculated at slightly above one cent per seat-mile or about one-half of that of the Douglas DC-3 type which was standard airline equipment up to the end of the war.

Airliners having speeds of 500 m.p.h. were envisioned by Douglas engineers. Their predictions were based on experiments with a design in which the parasitic dead air nearest to a plane's surfaces could be removed through slits in the structure and sucked into the plane's jet engines.

Speeds as high as 600 m.p.h. were foreseen by executives of American Airlines who have ordered British jet engines for comparative tests against American types to determine which are best suited for their future equipment needs.

**Gas Turbine Design Abroad.** Details of Britain's most powerful production turbojet, the Rolls-Royce Nene (RB-41), were released early in 1946. The

Nene is a development of the original Whittle centrifugal compressor type (See YEAR BOOK, 1945). It differs essentially from American engines of this variety (General Electric I-16 and I-40) in that its compressor is two-sided instead of single-sided. The double impeller compressor is capable of handling more incoming air for a given diameter. Since the overall efficiency of a turbojet is the product of the efficiencies of the compressor and the turbine, the Rolls-Royce Nene is a highly efficient power plant. In this manner the designers have produced an engine capable of a thrust output equivalent to a single side compressor engine of very much larger diameter or frontal area.

The Nene is the most powerful jet propulsion engine in production in England at the present time. Plans are underway to produce it under license in this country. It has a sea level static thrust of 5,000 lb. at 12,300 revolutions per minute. Its overall diameter is 49.5 in. and its weight 1,550 lb.

The double sided compressor impeller has 29 vanes per side with separate forged aluminum machined guide vanes. Behind the compressor impeller is a smaller single side-cooling impeller which forces air through manifolding to the center and rear bearings and the turbine disk. Temperatures at these points are critical in gas turbine engines.

The single stage turbine disk is machined from solid steel and 54 blades are set into it by the "Christmas tree" method of attachment. Blades are of Nimonic 80 steel, a new high temperature alloy developed by British metallurgists.

The Nene is a through-flow type having nine combustion chambers. Igniter plugs are used in starting, after which the ignition system is cut out automatically and flame igniters are used. The lubrication system represents a departure from earlier Rolls-Royce practice in that a wet sump system is used.

A combination of centrifugal and axial flow compressors is found in the British Theseus 1. Turboprop engine, a British gas turbine with propeller drive designed for installation in long range airliners having speeds of 300-400 m.p.h. Another unique feature of this design is the embodiment of a heat exchanger which contributes substantially to the low fuel consumption of the engine. These unusual design features indicate the many possible combinations of types of jet propulsion engines. In the Theseus the unusual features result in a fuel consumption comparable to that of reciprocating engines of equivalent power output and a longer period of operation between overhauls than that of most other turbine types.

The airflow pattern starts with the nine-stage axial flow compressor, then to the single stage centrifugal compressor unit. When it leaves the centrifugal unit it has been compressed 5 times (at 20,000 ft). The air then passes through the heat exchanger, where its temperature is raised by the use of exhaust gases, and thence through the combustion chambers. After leaving the combustion chambers it acts upon a two-stage turbine which drives the compressors and upon an independently mounted single-stage turbine which drives the propeller. From the turbines it passes to the jet nozzle by way of the hot side of the heat exchanger. By this ingenious method the high temperature outgoing air heats the cooler compressed air at the beginning of the air flow cycle.

At 300 m.p.h. approximately 80 percent of the power available is used to drive the propeller. A propeller pitch control mechanism is used to maintain the speeds of the two turbine units at a constant ratio.

The heat exchanger unit, which weighs 500 lb., is optional in the design of the Theseus 1, its weight being justified where the power plant is to be installed in a long range airplane. The unit consists of a multiplicity of straight tubes placed axially to reduce resistance losses in the passage of the hot gases. Tubes are arranged in 16 sets, eight of which are outlet, and the remainder inlet, with each group separated by headers. The compressed air flows radially inward and then reversed to the outlet headers.

Six main bearings are used in the Theseus; two for the compressor assembly, two for the propeller shaft, and two for the propeller turbine and its drive shaft. An 8.4:1 epicyclic reduction gear is used for the propeller drive, providing a propeller speed of 1,070 r.p.m. at maximum power.

The Theseus 1, has a diameter of 48 in. and a dry weight of 2,130 lb. Its power at sea level is 1,950 b.h.p. plus 500 lb. of thrust from the jet.

Still another combination of compressor types was found in the German Heinkel Hirth O11. Turbojet which was almost ready for production when the war ended. German designers sought higher compressor efficiency in this type by three units, consisting of a frontal single stage axial blade row, a diagonal compressor and finally a normal three stage axial unit. All of these are mounted on the same shaft and driven by a two stage turbine.

Air leaving the first axial stage is constricted by a fairing before it reaches the wide blades of the diagonal compressor. Fuel is fed into an annular combustion chamber by 16 equidistant nozzles. Four ignition plugs are used and provision is made for two others. The two rows of hollow turbine nozzle vanes and the turbine itself are cooled by air bled from the compressor.

Static thrust at sea level of the O11 at 10,200 r.p.m. is 2,860 lb. Maximum diameter is 34.4 in. Total dry weight, including accessories, is 2,085.2 lb., of which 112.1 lb. accounts for the accessories which include a Reidel starter, as used on the Junkers Jumo 004 and BMW 003 engines; Bosch or Siemens generator; a high pressure Barnag pump; air compressor and tachometer.

**Rocket Engines Installations.** American rocket engines came into widespread use in experimental aircraft and guided missiles during 1946. Details of the 6000 C4 type, developed by Reaction Motors Inc., were released by the Navy. This power plant is a four cylinder unit weighing 210 lb. and developing 6,000 lb. of thrust. Fuel is liquid oxygen and alcohol. This fuel combination requires electrical ignition and presents complex storage problems in the case of the liquid oxygen. Experiments were conducted with many other fuels including aniline and various acids.

The 6000 C4 was the power plant of the Bell XS-1 experimental supersonic airplane which was tested early in December at the Muroc Army Base.

The XS-1 was developed under Army Air Force sponsorship by Bell designers from basic data accumulated during a decade of basic research by the National Advisory Committee for Aeronautics. Another similar project is under development by Douglas for the Navy.

Purpose of the transonic aircraft program is to penetrate the barrier represented by the speed of sound with a man-carrying aircraft. Some scientists in Germany and England, as well as some of our own, have thought such an achievement impossible, but a small group of less conservative thinkers in all three countries have attempted it. The German work, which was conducted throughout the war by students under the leadership of Dr.

Alexander Lippisch, was never completed. In England, the program based on the Miles M-52 airplane, has been postponed. In this country the XS-1 project was delayed by the death in a conventional plane of Pilot Jack Woolams who lost his life while preparing to compete in the 1946 National Air Races. Woolams had been training for the supersonic flights in which the XS-1 plane was to have been carried to the maximum speed and altitude of a specially adapted B-29 bomber and then released. With a 4-minute fuel supply it was to have passed through and beyond the hazardous transonic speed range between 600 and 900 m.p.h. Former Navy Pilot Chalmers H. "Slick" Goodlin made the first flight in December. The initial test was made under partial power and did not reach the transonic speed range. A series of approximately 20 flights will be made before full power is used under present plans.

Other rocket propelled aircraft and a number of guided missiles were under development during the year. Rocket propelled missiles or aircraft show a marked superiority over other types at both very short and very long ranges. Work is also underway on multi-stage rockets which can be timed to fire in succession. A rocket traveling outside the earth's atmosphere could reach such a speed that centrifugal force would balance the pull of gravity. Then the range is infinite without further expenditure of energy or mass. This fact opens up the ultimate possibility of interplanetary travel and the near term prospects of travel far beyond the earth's atmosphere.

Many methods of jet propulsion were studied by the National Advisory Committee for Aeronautics at its Cleveland engine laboratories during the year. Research on ram jets, rotojets and intermittent duct or resojet engines was conducted at many government and private laboratories. Of tremendous practical importance was the commercial availability during 1946 of the Jato (jet assisted take off) unit developed during the war by Aerojet Inc. Addition of four of these units to a standard Douglas DC-4 airliner increases its payload 7,000 lb. by permitting overload at take off. This immediately practical use of rockets has an important significance in air transport economics.

LESLIE E. NEVILLE.

**ROSENWALD FUND, The Julius.** During the 29 years since its establishment in 1917 by Julius Rosenwald, the Fund has expended approximately \$20,000,000, this being all its income from year to year and about seven-eighths of its principal fund. The Trustees are required to expend all funds within 25 years of the death of the founder, that is, before Jan. 6, 1957. At the close of the fiscal year June 30, 1946, the assets of the Fund had a value of approximately \$2,500,000. The chief program of the Fund during its early years was aid in the building of rural public schools for Negroes. The main programs in 1946 were: (1) Improving the content and quality of rural education in both white and Negro schools in the South; (2) fellowships for Negroes and for white southerners; and (3) efforts to improve race relations, especially the relations between white and colored citizens throughout the United States. During the year 1945-46 the Fund expended \$716,500 upon these and related programs.

**ROWING.** A heavy band of sweep-swingers from Wisconsin came East in the Spring of 1946 to capture honors in the first big intercollegiate regatta held since 1941. Competing at Annapolis for the

championship of the Eastern Association of Rowing Colleges, the Badgers won by a length from Navy with Columbia, Rutgers, Cornell, Penn, Princeton, M.I.T. and Harvard trailing.

Paced by Carl Holtz, an ex-bombardier with 42 missions to his credit, the cardinal-clad oarsmen from the dairy country covered the mile and three-quarter course over a choppy, wind-swept Severn in 9:12½, time that Col. Howard Robbins, referee, hailed as "almost incredible for this river."

Following other victories in Eastern waters Wisconsin traveled to Seattle where eight varsity crews raced in the Lake Washington international regatta—a new event on the nation's sports schedule. But the Badgers met more than their match on the coast for Cornell, a powerful crew that couldn't find itself earlier in the season, came back to triumph before 200,000 persons, the largest crowd ever to witness a sports event in the Pacific Northwest.

M.I.T., Washington, and favored Wisconsin—dragging its unbeaten record behind it—were next over the line, followed by Harvard, California, Rutgers and British Columbia.

Yale and Harvard resumed their annual classic with the same result that had become monotonous in the late prewar years—a sweep for Harvard. When the Crimson varsity crossed the finish line it marked the eighth straight victory over the Elis. Perhaps the sting of these many setbacks annoyed New Haven residents for late in the year Yale signed Allen Walz, Wisconsin's successful coach, to help bring the Bulldog back to the head of the river.

Oxford defeated Cambridge by three lengths in their first formal meeting on the Thames since 1939, a happy, peace-freed crowd of 500,000 cheering them on from Putney to Mortlake.

England also held its first full postwar Henley with the major prize, the diamond skulls, going to Jean Sèphariades of France when he defeated 19-year-old John Kelly, Jr. of the United States Navy. Sèphariades' powerful lunge strokes proved too much for the Philadelphian, who was severely handicapped by the lack of training time.

Kelly, son of a former United States champion and Olympic winner, again was the outstanding star of America's scullers, retaining his crown in the colorful Canadian Henley and ousting Art Gallagher of Philadelphia as champion in his first bid in our national championships, which had been suspended during the war.

Joe Angyal of Brooklyn ranked second behind Kelly with three victories in the People's regatta on the Schuylkill and two in the United States title tests.

THOMAS V. HANEY.

**RUBBER.** Thrust into great prominence during the war as a critical raw material for both military and home front use, rubber came back into its own as a factor in the civilian economy during 1946 in the form of more than 50,000 consumer and industrial products.

The first full year of peace saw rubber consumption in the United States soar past the million-ton mark for the first time in history. Consumption, estimated by the Rubber Manufacturers Association at 1,026,000 tons, was 54 percent ahead of 1940 (the best previous peace time year) and more than 100 percent above average annual consumption for the ten years from 1930 to 1940.

By the year's end, the value of end products produced by the Rubber Manufacturing industry in this country had passed the two billion dollar mark.

These products included tires and inner tubes, rubber mechanical goods, rubber footwear, rubber sundries, druggists', surgical and hospital goods, rubber coated fabrics and protective clothing, rubber flooring, hard rubber products, rubber heels and soles, latex foam and chemically blown rubber sponge, rubber sports wear and rubber thread.

To achieve production at these levels, rubber manufacturers had expanded employment from 150,000 to 300,000 factory and office workers between 1940 and 1946.

Moreover, the industry used at or near capacity the vast plant expansions of the wartime period. This expanded capacity (up 63 percent in tires and tire materials, for example) was accounted for in the form of new factory space, new milling machinery, molds, and curing equipment.

**The Raw Materials.** Prior to the war, American manufacturers were almost entirely dependent upon foreign sources for rubber. In 1941, for example, the industry consumed less than one percent of its total requirements in manufactured rubber. The balance was natural rubber—most of it from the Far East.

A vast new network of copolymer plants mushroomed American production of manufactured rubber to 830,780 tons by 1945. It was the availability of this rubber, born of the most urgent wartime needs, that enabled American manufacturers to score a bulls-eye on their reconversion target in 1946.

Using rubber at the rate of more than 250,000 long tons a quarter, the industry had only 33,294 tons of natural rubber available in the first three months of 1946 to satisfy the greatest backlog of civilian orders in its history.

Only the abundance of high quality manufactured rubber saved the industry's reconversion program from bogging down completely. The importance of manufactured rubbers in this respect was evident in the figures showing the industry's consumption through October 31, 1946. For the ten month period the industry used 201,410 tons of natural rubber, as against 645,350 tons of manufactured rubber. The latter category included 537,262 tons of GRS, general purpose type rubber; 67,081 tons of GRI, butyl type rubber; 36,122 tons of GRM, neoprene type rubber; and 4,885 tons of GRA, or the so-called N-type rubbers.

Easing supplies of natural rubber as the growing areas of the Far East gradually came back into production enabled the government to relax the stringent wartime use patterns which had held manufacturers to the overall use of 12 percent natural rubber and 88 percent manufactured rubber.

By the end of 1946, this pattern had been relaxed to allow the use as an overall industry average of 37 percent natural rubber and 63 percent manufactured rubber. In some products the Civilian Production Administration and later the Office of Temporary Controls permitted the use of greater amounts of natural rubber in some products, while specifying proportionately greater amounts of manufactured rubber in others where its special properties were desirable for superior performance.

**Price.** Government controls over rubber continued into 1947, both with respect to buying, allocation to manufacturers, and specification, and with respect to price. The copolymer plants remained under government ownership and the price of GRS continued at 18½ cents a pound, although average costs—exclusive of amortization and administration—dropped from slightly more than 23 cents a pound in 1945 to less than 14 cents a

pound in 1946. In some plants costs of producing GRS had been shaved to below 12 cents a pound by the year's end.

The price of natural rubber to manufacturers was held by the government to 22½ cents a pound throughout the year. This was the pegged price of the wartime period. The government through the Rubber Development Corporation, its procurement agency, bought all of its first half requirements and an additional 200,000 tons of Far Eastern rubber in the second half at 20¼ cents a pound. Under a buying contract entered into with the British and Dutch covering the period from June 30, 1946, the government paid 23½ cents a pound for approximately 145,000 tons of natural rubber in the third quarter, for top grade rubber.

Trading in rubber futures was resumed on the London Market in November.

**Forward Supply.** The importance of adequate supplies of manufactured rubber if world requirements of rubber goods are to be met in 1947 and 1948 was underscored by the International Rubber Study Group at the year's close.

This group, which includes United States, British, Dutch, and French government representatives, met at The Hague in November.

Assuming high economic activity in Western countries, as well as reasonable stability in Far Eastern political conditions, particularly as applies to Indonesia, world production and consumption of natural and manufactured rubber was estimated as follows:

Natural rubber production for 1946—850,000 tons; 1947—1,200,000 tons; and 1948—1,450,000 tons.

Disregarding stockpiles, world consumption for both natural and manufactured rubber was forecast as 1,600,046 tons for 1946; 1,700,047 tons for 1947; and 1,675,000 for 1948.

Representatives of The Netherlands spoke of 350,000 tons being available for export in Indonesia during 1947. It was further reported that 22,000 tons per month are now being produced in Borneo, Sumatra, and Java. French Indo-China is expected to produce a minimum of 30,000 tons.

A fourth meeting in Paris was tentatively arranged for the early part of next summer. Final decision as to time and place rests with the member governments.

**Component Materials.** Manufacturing records established in 1946 were achieved in the face of a year of recurrent shortages of component materials—in many cases so acute that the industry was only a matter of days away from widespread shutdowns. Priority assistance from the Civilian Production Administration in the release of scarce materials was helpful in averting production stoppages in some instances.

Most acute scarcities occurred in textiles. With the industry normally using more than 500,000 bales of cotton a year, rubber manufacturers were particularly handicapped by the short supplies of tire cord and scores of fabric constructions. Nor was it until just before the year's end that the government lifted controls on the use of rayon in rubber products.

Threat of production stoppages was also carried in the continuing shortages of soaps, resins, casein, beadwire steel and in some of the 1,300 odd chemicals used in the fabrication of rubber products.

**New Types of Rubber.** Under the urgent dictates of military necessity, the government limited the wartime output of general purpose synthetic rubber to the mass production of two GRS types. While this facilitated production of suitable rubber in

quantity during the emergency, it tended to retard the quest for new and better polymers.

Since the war's end, research and development on new types of manufactured rubber have unfolded rapidly. At the present time the Office of Rubber Reserve has approved more than 360 experimental polymers and has granted authority for trial production of specified quantities of each for the large scale evaluation of processing and vulcanizing properties.

Eighty of the 360 polymers had been placed in substantial production by the end of 1946. Many of the experimental types were modifications of butadiene-styrene copolymers, resulting from the employment of new emulsifiers and coagulants in the polymerization process. Some of the others involved the replacement of either the butadiene with another diene or the replacement of the styrene with either substitute styrenes or other vinyl compounds.

The rubber manufacturing industry's rapidly growing research facilities, now valued at more than \$25,000,000 and staffed by approximately 5,000 skilled scientists and technicians, expanded substantially in 1946. The year's end found technical journals describing research on synthetic rubber and latex in these laboratories as having already "reached the stage where new molecule building is almost a daily occurrence."

#### THE RUBBER MANUFACTURERS ASSOCIATION, INCORPORATED.

**RUMANIA.** A kingdom in southeastern Europe. King: Michael I, who ascended the throne upon the abdication of his father Carol II on Sept. 6, 1940.

**Area and Population.** The area of Rumania in July, 1945, was about 91,671 square miles and the population was approximately 16,409,367. This includes the restoration (March, 1945) of northern Transylvania (16,641 sq. mi.; pop. 2,573,000) from Hungary but is exclusive of Bessarabia and northern Bukovina which were recognized as parts of the U.S.S.R. and restored the Soviet-Rumanian frontier of June 28, 1940. Chief cities (estimated, 1945): Bucharest (capital), 984,619; Iasi (Jassy), 108,987; Cluj, 110,956; Timisoara, 108,296; Galati, 93,229.

**Government.** By royal decree of August 31, 1944, the Constitution of 1866, modified by that of 1923, was restored. On the decision of the Cabinet, legislative power is exercised by the King, pending new elections. A new Cabinet drawn from the Plowmen's Front, with Petru Groza as Prime Minister, was appointed on March 6, 1945.

**Events.** During the year the Government of Petru Groza, which enjoyed the confidence and support of Russia, consolidated its power and further weakened its opposition, so that it obtained a sweeping victory at the elections of November 19. The opposition looked to the western Allies for support in safeguarding their interests, and displayed special affection for King Michael, as a symbol of national sovereignty against foreign dictation. But the stability of the Government was acknowledged, and its prestige augmented, by the recognition accorded it by Great Britain and the United States, though these Governments repeatedly expressed dissatisfaction with the imperfect implementation of Rumanian engagements to introduce a fuller measure of democracy.

On December 26, 1945 an Allied Commission meeting in Moscow, consisting of Andrei Vishinsky, Russian Vice Foreign Minister, Sir Archibald Clark-Kerr, British Ambassador to Moscow, and W. Averell Harriman, United States Ambassador to

Moscow, agreed to require the Rumanian Government to broaden its composition by including as representatives of their respective parties one National Liberal and one National Peasant, both to be "suitable" and to "work loyally" with their Government, and further to pledge free elections and to guarantee freedom of press, speech, religion, and assembly. The Commission proceeded to Bucharest for discussions with King Michael and with Prime Minister Groza. It was the King's position that the Government should be regarded only as caretaker and that the Ministries of Interior and of Justice be put into other than Communist hands. It was understood that Iuliu Maniu and Constantine (Dinu) Bratianu, traditional leaders of the historical National Peasant and National Liberal Parties respectively, would be unacceptable to the Soviets, but it was confidently expected that Ion Mihalache or Nicolae Lupu, the two vice-presidents of the Peasant Party, and Constantine (Bebe) Bratianu, nephew of Dinu and Secretary General of the Liberal Party, would be appointed. Groza impugned their loyalty, however, and Vishinsky accepted his charges. Instead, two nonentities were appointed, Mihai Romniceanu for the Liberals and Emil Hatieganu for the Peasants. Hatieganu was a Rumanian chauvinist of the old school, with a fascist record, it was said that he was included only to discredit the western Allies by making it appear that a known fascist had been appointed only at their insistence.

The Commission completed its work on January 9, having received assurances that the historical parties would be represented in the Government, that elections would be held, and that civil liberties would be safeguarded. Difficulties, in part genuine, and in part contrived by the Groza Government for its own ends, obstructed the prompt fulfilment of these engagements. Press censorship presented a real problem, for relaxation encouraged anti-semitic and pro-fascist writings, nevertheless controls were gradually reduced. Groza's persistent postponement of elections until the fall stemmed from political considerations. The new electoral law would enfranchise new groups favorable to the Left, and various devices, whose legitimacy the opposition naturally questioned, could be employed to weaken the bourgeois parties. The transformation of the *Uniunea Patriotilor*, formerly a conservative political organization, into the National Popular Party was an attempt to attract bourgeois support for the Groza Government. The sudden proliferation of small parties was apparently calculated to weaken the traditional opposition parties. Communist efforts to procure that the Socialists adopt a single electoral list with them were opposed by the Socialist leader Constantine (Titel) Petrescu, but in vain, and the single list was adopted. On the other hand Mihai Romniceanu and Emil Hatieganu who had been appointed to represent the major opposition parties in the Government as Ministers without Portfolio subjected Groza's policies to constant criticism. They complained that their parties were being suppressed, that the Moscow agreement was being violated, and that Government manipulation would make it impossible for a fair election to be held. This view was supported, with increasing warmth as the date of the election approached, by Iuliu Maniu, leader of the National Peasant Party, and by Constantine Bratianu, leader of the National Liberal Party. An upsurge of enthusiasm for the King was also an indication of opposition to the Government. On May 6 Ion Antonescu, Mihai Antonescu, and twenty-two others were put on trial as war criminals.

The charge was based on Minister of Justice Lucretiu Patrascanu's decree law No. 312 of April 24, 1945, which included in the category of war criminals those who decided upon the declaration of war against Russia and her allies. The Government's indictment ran to two hundred pages, and it was evident that the guilt of the accused might have been proven in a fair trial; but the character of the trial as it was conducted, as well as its timing, made it plain that the Government was using the occasion to discredit Iuliu Maniu and Constantine Bratianu, who were on record as having had relations with the Antonescu regime. The Parties represented by these leaders as well as the Tatarescu Liberals had vigorously opposed Minister of Justice Patrascanu's electoral bill, which was promulgated in April. They had particularly opposed the granting of the franchise to military personnel, the lowering of the age limit, and the abolition of the senate by the provision for a unicameral legislature. The displeasure of the opposition was also aroused by Groza's manifestations of friendship for Hungary. Despite efforts by both Governments to improve Rumanian-Hungarian relations, the results seemed to be limited to gestures of intellectual co-operation, each people continued to cherish ill will for the other. It was to be expected that Rumanian foreign policy would follow lines agreeable to the Soviets. Nevertheless the policy of orienting Rumanian economy towards the Soviets and excluding the west was modified in the interest of procuring American capital for reconstruction. The Malaxa and the Ausnit interests, which had access to such capital, were given special facilities and exemptions. On October 2 the Rumanian Government ratified a clearing agreement with France providing for the exchange of French manufactured goods for Rumanian agricultural products and oil, to the amount of 400,000,000 francs.

Unlike the Bulgarian Government, which was similarly under Soviet influence, the Rumanian early received recognition from the Governments of Great Britain and the United States; but charges of failure to implement the Moscow agreement, upon which recognition was premised, were the basis of repeated representations by these Governments. On January 25 Mr. Burton Y. Berry, United States political representative in Bucharest, was instructed to join the British in a statement that the two Governments would accord Rumania recognition if certain assurances were given. This move gave the Government great satisfaction and disheartened the opposition, who nevertheless continued to look to Great Britain and the United States to defend their position. On May 27 a United States note admonished the Rumanian Government for its failure to fulfil the obligations of the Moscow agreement. On June 3 G. Tatarescu, Vice Prime Minister and Minister for Foreign Affairs in the Groza Government, replied in a firm tone that conditions of order and liberty were satisfactory and that preparations for the election were proceeding in a satisfactory manner. On June 13 the British and American representatives notified the Rumanian Government that this reply was unsatisfactory. The political manipulations against which the opposition had protested and which had been the basis for the American and British notes proceeded unchecked, so that Communist controlled newspapers were able to announce on October 4 that 93 percent of Rumania's citizens were registered in the electoral lists. This announcement provoked Iuliu Maniu and Constantine Bratianu to charge that the lists had been grossly falsified and hence that no election based upon them could be

legitimate. The protests of the opposition leaders received wide attention abroad, and on October 28 Great Britain and the United States again directed notes to Rumania pointing out that Rumanians would not be able to vote freely in their election because of the coercive actions of their Government. This protest was rejected by the Rumanian Government on November 4 on the grounds that (a) since the elections had been agreed upon by the three powers meeting in Moscow, the Rumanian Government could not recognize separate protests by two of the powers, for Russia had not objected to the election procedures; (b) United States observations and recommendations constituted interference with the internal policy of Rumania and were incompatible with the rights of a free and sovereign state; and (c) the Rumanian Government would in fact fulfil the Moscow agreement, and the election would represent the will and aspirations of the Rumanian people. At the same time the Moscow radio charged that Anglo-American support had encouraged Rumanian reactionaries, even to the point of organizing and arming terrorist groups to hamper the Government.

Three days before the election both Great Britain and the United States warned Rumania that elections under prevailing conditions would be unacceptable. In the elections which were nevertheless held on November 19 the opposition won only 66 seats as against the 338 of the Government bloc, which were distributed as follows: Socialists, 78; Dissident National Liberals (George Tatarescu), 72; Plowmen's Front (Groza), 71; Communists, 70; National Popular Party (Government created middle class party), 26; Dissident National Peasants, 21. In addition the Government will have the support of ten other independents whom it endorsed. Approximately 5,000 persons called at the American mission in Bucharest to complain that they had not been permitted to register, and in consequence the building was picketed by adherents of the Groza Government. Both British and American authorities declared the elections fraudulent. An American note stated that extensive reports made it "abundantly clear that, as a result of manipulations of the electoral registers, the procedures in conducting the balloting and the counting of votes, as well as by intimidation through terrorism of large democratic elements of the electorate, the franchise was on that occasion effectively denied to important sections of the population." Accordingly the United States could not regard the requirements of the Moscow agreement as fulfilled. In Rumania the opposition declared it regarded the elections as void and demanded new elections. The position of the Government was that the elections represented the true will of the people, and that in consequence there was no longer need for the two opposition representatives in the Government as required by the Moscow agreement.

**Production.** About three-fourths of the population is engaged in agriculture. Rumania normally produces an export surplus of cereals, livestock and animal products. In 1945, 2,075,000 hectares were sown with wheat; 3,473,000 with corn; 697,000 hectares with barley; and 766,000 hectares with oats. The crop yielded by 1,885,000 hectares of wheat was 1,063,000 tons; 2,669,000 hectares of corn was 1,097,000 tons; 595,000 hectares of barley was 267,000 tons and 626,000 hectares of oats was 258,000 tons.

The total output of crude oil in 1945 was 4,636,000 metric tons and of natural gas, 1,774,000,000 cubic metres. Production of lignite in 1944 was 2,271,000 tons.

**Foreign Trade.** In 1944 foreign trade was valued at 62,191 million lei, with imports totaling 30,016 million lei and exports 32,175 million lei.

**Finance.** The budget for the year ending March 31, 1945 consisted of revenue of 222,170 million lei and expenditure of 252,170 million lei. By April 1, 1945, the public debt stood at 98,936 million lei. Notes in circulation, December 1945, totaled 1,102,535 million lei.

MOSES HADAS.

**RURAL ELECTRIFICATION ADMINISTRATION (REA).** An agency created under the Emergency Relief Appropriation Act of 1935 and transferred to the U.S. Department of Agriculture in 1939. Administrator: Claude R. Wickard. For a report of its activities in 1946, see AGRICULTURE.

**RUSSELL SAGE FOUNDATION.** A Foundation created in 1907 through a gift of \$10,000,000 by Mrs. Russell Sage, as a memorial to her husband; additional \$5,000,000 was left to the Foundation in Mrs. Sage's will. Its principal purpose is to study social and living conditions in the United States, and to make available to citizens, organized groups, and others such information and proved methods as will assist them to relieve, remedy, or prevent adverse conditions affecting the welfare of their communities. Among the types of activities which in recent years have been carried on by the Foundation's own Departments, or through its grants to agencies with similar purposes, are: adult education, city and regional planning, family welfare, training for social work, study and coordination of community social work programs, studies in the professions, child welfare, leisure-time activities, legal aid, social welfare publications, improvement of race relations, research in the social sciences, methods of relief, improvement of conditions affecting small loans, control of consumer credit, industrial factors in social and living conditions, increasing the public understanding of social work, social statistics, and the relation of the arts to social work. Printed reports of its principal studies are issued by the Foundation, and to assure their greater distribution to interested persons are made available at cost. Among its recent publications are *American Foundations for Social Welfare* by Harrison and Andrews; *Community Centers as Living War Memorials* by Dahur; *Definitions and Instructions for Reprinting Monthly Statistics of Family Casework* by Hurlin; *Law Training in Continental Europe* by Schweinburg; *Music in Hospitals* by van de Wall; *Statistics of Medical Social Casework in New York City, 1945* by Hurlin; *The Use of Research by Professional Associations in Determining Program and Policy* by Brown.

The offices of the Foundation are at 130 East 22 Street, New York 10, New York. A social service Library, open to the public, is maintained at the same address. Morris Hadley is President of the Board of Trustees. Shelby M. Harrison is General Director.

**RYUKYU (LOOCHOO) ISLANDS.** A chain of islands reaching from the Japanese main island of Kyushu to near northern Formosa. They passed under Allied military control partly by conquest in the early months of 1945 and were completely occupied following the surrender of Japan in September, 1945. Area: 921 square miles. Population: 600,000 (estimated). Capital: Naha, on Okinawa—the largest island in the group.

**ST. HELENA.** A British colony in the South Atlantic, consisting of the island of St. Helena (47 square

miles) and its dependencies—Ascension Island (34 square miles), 700 miles northwest of St. Helena, and the smaller Tristan da Cunha group, about halfway between the tip of Africa and South America. Population of St. Helena (1940 estimate), 4,710. Capital, Jamestown on St. Helena. St. Helena and its dependencies are administered by a governor and an executive council, assisted by an advisory council.

**ST. LUCIA.** An island colony in the Windward Islands group of the British West Indies. Area, 233 square miles. Population (1942 estimate), 73,770. Capital, Castries (12,000). St. Lucia is governed by an Administrator, acting under the Governor of the Windward Islands. The Administrator is assisted by a nominated Executive Council and by a Legislative Council, some of whose members are elected. Sugar, copra, cacao, and fruits are the chief products.

**ST. PIERRE AND MIQUELON.** A French colony comprising two small groups of islands near the south shore of Newfoundland. Area: St. Pierre group—10 square miles; Miquelon group—83 square miles. Total population, 4,120. Capital, St. Pierre. Fishing is the chief industry. Trade (1943): imports 30,338,370 francs; exports 10,259,434 francs. Textiles, wines, salt, and foodstuffs were the chief imports. Cod (fresh and dried) and fish products were the principal exports. Governor: Pierre Garrouste.

**SAIPAN.** A coral island in the Mariana group of the Japanese Pacific Islands, occupied by United States armed forces in July, 1944. On November 6, 1946, the United States requested that the island be placed under United Nations trusteeship with the United States as administering authority. It is about 15 miles long from north to south, and about 4 miles wide. Area, 72 square miles. The population before the war included 40,000 Japanese, 4,000 Chamorras, and 1,000 Kanakas. Garapan, the only town, is on the west side of the island. During peacetime the annual export of sugar was valued at more than \$6,000,000.

**SAKHALIN.** An island northeast of Japan, in the Sea of Okhotsk. Area, 28,597 square miles. The southern part (south of 50° N.) was under Japanese control from 1905 when it was ceded by Russia in the Treaty of Portsmouth until the surrender of Japan in 1945 when it was occupied by armed forces of the U.S.S.R. According to one of the terms of the Yalta agreement signed by the "Big Three" the southern half of Sakhalin (including adjacent islands), was to be restored to the U.S.S.R.

**SALVATION ARMY.** The, is a religious body operating in 98 territories of the world, preaching the gospel of Christ in 102 languages, and ministering to emergency needs of humans. Trained officers numbering 27,000 guide its over 5,000,000 followers.

Following the Salvation Army's positive reaction to war urgency needs, the organization sought to help win the peace by action. Its facilities were revamped to serve men headed overseas as replacements, to help returning servicemen step back into civilian life, to assist their wives and families, to brighten the days for hospitalized servicemen, to continue to provide a home away from home. Such activities were channeled through its network of rehabilitation services, its mobile canteens, its Red Shield Clubs, and those operated through USO.

A national goal was set for expanded programs:

preventive and rehabilitative service in police courts and prisons; extension of Salvation Army facilities to small towns and rural areas of the United States; a quickened effort to broaden the Army's religious, welfare, health, educational and character building activities.

Among reconversion "musts" aimed at through its activities, The Salvation Army emphasized the recapture of a normal mental outlook; care and recovery for the sick and maimed; food and clothing for the needy; a broad program of employment; the return of family life to a normal peace-time basis; building up of health and character for the children of the nation.

Youth activities were intensified particularly during the summer months when over 27,000 mothers and children were emancipated from the blights of stifling city summers at Salvation Army Fresh Air Camps.

During the country-wide clothing drive, Salvation Army centers shouldered their share of the job by collecting, repairing, and crating garments for the needy overseas. Addition overseas relief activities were in full swing. Local Corps and other units hurried a wide range of relief supplies to war-torn countries. Many Salvation Army kitchens were converted to canneries where volunteers processed food for overseas shipment. Its world-wide chain of units facilitated the task, and many governments requested the organization to render more aid than ever before. Relief shipments were speeded to all countries where the need was greatest.

The entire program was coordinated through National Headquarters, New York City by Commissioner Donald McMillan, National Secretary.

**SAMOA.** A group of 14 islands in the mid-Pacific just below the equator and 4,150 miles southwest of San Francisco. The islands of the group east of 171° W. longitude, called American Samoa, belong to the United States; those west of that line are administered by New Zealand under a mandate of the League of Nations and are known as Western Samoa.

**American Samoa.** American Samoa includes the island of Tutuila on which the U.S. Naval Station is located; the Manua group, consisting of the islands of Tau, Olosega, Aunu'u, and Ofu; Rose Island, and Swains Island. These islands, with the exception of Swains Island, were acquired on December 2, 1899, through a tripartite agreement with Great Britain and Germany. By joint resolution of Congress, approved March 4, 1925, Swains Island was annexed to American Samoa. All but Rose Island, which is an uninhabited coral atoll, are of volcanic formation. The total area is 76 square miles and the population, as of June 30, 1946, was 17,077, mainly Polynesian, an increase of more than 25 percent over the last prewar population figure reported. The seat of government is at the village of Pago Pago, Tutuila, which has one of the finest harbors in the South Seas.

American Samoa, classified as a United States possession, is under the control of the Navy Department and is administered by a Naval Governor. Samoans are not citizens of the United States but owe allegiance to the American flag as nationals of the United States. While the Constitution of the United States does not extend to American Samoa, the Regulations and Orders for the Government of American Samoa, printed in both English and Samoan languages, contain most of the guarantees of the Bill of Rights of the United States Constitution. Local administrative matters are conducted

by village, county and district councils composed of hereditary chiefs and their advisors. The Chief Samoan legislative council, or Fono, meets annually and serves in an advisory capacity to the Governor in matters relating to the welfare of American Samoa. For purposes of local administration American Samoa is divided into three districts each having a Samoan governor. The judicial power is vested in Village Courts each presided over by a village magistrate; six District Courts each presided over by a Samoan District Judge and a United States District Judge; and a High Court presided over by a United States civilian Chief Justice and two Samoan Associate Justices selected from the District Judges.

During the year ending June 30, 1946 instruction was offered by 44 public and 6 private schools having a total enrollment of 3,903 and employing 95 Samoan teachers and 2 Samoan principals. Attendance is compulsory for children between the ages of 6 and 15. English is used in public schools and the Samoan language in private schools. Illiteracy in 1930 was lower than in any other U.S. possession—6.3 percent. Copra, dried coconut meat, the most important crop for commercial sale, produced a gross income of \$27,394.21 for the period between January 1, 1945 and June 30, 1946. The Department of Samoan Industry, established in April, 1946 to encourage the production of Samoan handicraft, reported sales amounting to \$4,220.02 for a two-month period.

The new Samoan Hospital was established in 1946 with a 200 bed capacity and a staff of 20 Naval Medical officers, 10 Naval nurses and 136 Naval corpsmen. A child health clinic on wheels has been instituted to visit all parts of American Samoa. It has averaged more than 600 infant examinations per month. An experimental and dairy farm is maintained for the improvement of Samoan agriculture and animal husbandry.

For the year ending June 30, 1946 the Bank of Samoa reported resources of \$1,607,672.53.

Captain H. A. Houser, U.S.N., the present Governor of American Samoa and Commandant of the Naval Station, Tutuila, assumed office September 10, 1945.

**Western Samoa.** West of American Samoa, less than 100 miles, lies Western Samoa, another group of islands of which the two largest are Savai and Upolu. Racially and culturally they are similar to American Samoa. Area, 1,133 square miles. Population (July 30, 1944), 65,643, including 61,804 Samoan natives (Polynesians). Capital, Apia, on Upolu. A common indigenous culture and common folkways and mores form the foundation of society in both American and Western Samoa. The natives are Christians of different denominations. There were 11,302 pupils enrolled in the schools in 1945. Copra, cacao, rubber, and bananas are the chief products. Trade (1943): Imports, £605,911; exports, £282,991. For the year ended Mar. 31, 1943, government receipts were £212,996; expenditures, £203,492. During 1943, 162 vessels of 69,475 tons entered the port of Apia.

The United States and New Zealand have taken joint measures for the defense of all the Samoan islands and a large U.S. air base has been constructed on the island of Upolu. Western Samoa is administered by the New Zealand Minister of External Affairs, acting through an Administrator in Apia. On October 5, 1945, Lt. Col. F. W. Voelcker was appointed Administrator by the New Zealand Government.

Early in 1946 New Zealand became the first of the United Nations to offer a mandated territory

(Western Samoa was formerly a German colony before World War I) to United Nations trusteeship when she suggested such a change for Western Samoa. On November 22 New Zealand brought the entire trusteeship question in the United Nations to prominence when she asserted she would continue to administer Western Samoa if United Nations provisions for joint control of the territory were found "unacceptable." At the closing sessions of the United Nations General Assembly, New Zealand trusteeship of Western Samoa was approved.

**SANITATION.** Great activity has been predicted for 1947 in the provision of sewerage facilities, based on: (1) the need for enlargement and improvement of all existing sewer systems and sewage treatment plants; (2) the need of sanitary facilities in numerous towns which now have none; (3) the nation-wide need of housing accommodations, and (4) the growing opposition to the pollution of rivers and other sources of water supply by sewage and industrial wastes. However, optimistic predictions may be offset by difficulties arising from shortage of men and materials for construction, or from government restrictions.

It has been estimated that new or extended and improved sanitary facilities needed by some 20,000 communities of over 200 population, represent an expenditure of \$4,417,000,000. This is exclusive of the numerous housing groups. A survey in Minnesota showed that of 734 places having populations of more than 500, there were 209 with sewers and sewage treatment plants, 111 had sewers only, and 414 had no such facilities. On the other hand, progress is checked seriously by uncertainties of labor, materials, and prices. These conditions tend to increase construction costs to such an extent above the estimates as to result in postponement of proposed works. An increasing factor in sanitary matters is the provision of municipal and private swimming pools, the overflow, wash water, and emptying of which must be delivered to the sewers.

A disturbing factor is the shortage of trained and experienced sanitary engineers, chemists, and skilled operators needed upon the design, construction, and operation of sewage works, as well as in municipal activities, food manufacture, research and other lines of work. In 1946, there were about 3,560 sanitary engineers in the United States, and 1,500 of these were commissioned officers in the army, navy, and public health service. This supply is entirely inadequate for post-war conditions and requirements. During the war, the training of undergraduates and graduates practically ceased, so that there is a five-year deficit in the already low rate of production of personnel. The main cause is the former drafting of students and beginners into the army. That the army made good use of its trained men is shown by its health records and its many plants built abroad, even in jungle areas.

Research and experimental work have been carried on in spite of unfavorable conditions. Ozone treatment has been tried at Kelso, Wash., but there is doubt as to its value beyond control of objectionable odors. At Los Angeles, a new bactericide has been tried for chemical treatment of sewage before it reaches the treatment plant. The activated sludge process is in favor where high quality effluent is required. Chlorination is employed at a number of plants. Aeration of sewage and sludge is being tried, as well as vacuum treatment of sludge. Chemical treatment has declined, but has advantages in the pre-treatment of industrial

wastes. Sewage gas is being used to an increasing extent.

Court decisions were rendered against the Sanitary District of Chicago for alleged infringement of patent rights in the activated sludge process, but the case will be carried to higher courts. The State of Illinois has suits against the State of Indiana and a group of Indiana cities and industrial plants for pollution of Lake Michigan, from which Chicago draws its water supply. But meanwhile some of the defendants are planning treatment plants. The State of California has brought suit against Los Angeles and nine other cities for pollution of the ocean beaches by sewage, but here again engineering is making progress, for Los Angeles has let contracts for a new sewer outlet extending a mile out to sea, and six cities around San Francisco Bay have proposed a joint sewage treatment plant.

At Denver, Colo., there is controversy between the city and State authorities over the quality of the effluent from the sewage treatment plant into the South Platte River. Only primary treatment is given, which the State considers inadequate, especially when the effluent is used for irrigating vegetable crops. Chicago is completing the equipment of its great West and Southwest sewage works, long delayed by war conditions and shortage of materials. Toledo, Ohio, has a long-term program for expansion of its sewage treatment works. Worcester, Mass., has been ordered by the State public health department to repair sewers damaged by excessive amounts of acid wastes from war industries.

Prohibiting the pollution of rivers, streams, and coastal waters by raw sewage and trade wastes is a rapidly widening policy, based on the dangers to public health, the bad quality and appearance of the water, and the nuisance condition, as at bathing beaches and in communities. More and more States are passing laws of this nature, and proposed national laws have been introduced in Congress, some of these giving restrictive power to the Federal government.

As part of a policy for cleaning the harbor and beaches at San Francisco, the city has a pumping plant in the Sea Cliff residential district to deliver sewage to the Richmond treatment plant. Public interest in the anti-pollution movement is being aroused by a movie-film on "Clean Waters" distributed by the U.S. Public Health Service. Another aspect of the anti-pollution policy is toward the development of sewage treatment and methods of recovering and utilizing valuable chemicals and other products now wasted.

Garbage and refuse handling is a troublesome problem in many cities, largely resulting from inefficient management and political control of collection and disposal. In the sanitary-fill system, successful in many cases, the material is deposited, spread, and covered carefully, and is not to be compared with the haphazard system of dumping on low ground or filling quarries or excavations.

At Fort Worth, Texas, the land-fill system costs 5.37 cents per cubic yard, against 15.96 cents for incineration. San Francisco, after fourteen years of experience, has renewed a contract for the land-fill system. Los Angeles uses garbage for hog feed, but has contracted for incineration of rubbish. Incinerators have been ordered also for Rome, N.Y., and Pittsfield, Mass. Allied to the problem of garbage collection is that of rat extermination. St. Louis has a rat-control program, and Chicago has considered such a plan, with power given to the authorities to enter upon private property upon which rats are harbored.

At Honolulu, Hawaii, a sewage system is planned, with a treatment plant on an island and the effluent discharged into the sea outside of the harbor. In Puerto Rico, several sewer systems and treatment plants are to be built by United States firms. At Germiston, Union of South Africa, the treatment plant is 11 miles from the city, and the sewage becomes stale, causing severe corrosion of the concrete. The remedy has been to provide ventilating manholes.

The Inter-American Association of Sanitary Engineering was organized by 160 delegates from fourteen countries at a conference held at Caracas, Venezuela, in October. A similar conference had been held in Brazil in July. The sanitary program of the U.S. Office of Inter-American Affairs has been taken over by the Department of State.

E. E. RUSSELL TRATMAN.

**SAN MARINO.** An independent republic in Italy, near the town of Rimini. Area, 38 square miles; population (1939), 14,545. Capital, San Marino. Chief exports: cattle, wine, building stone. Financial estimates (1939-40) were balanced at 6,009,919 lire. The legislative power is in the hands of the grand council of 60 members elected by popular vote. Two are appointed from this council every six months to act as regents.

**SARAWAK.** A British crown colony on the northwest coast of the island of Borneo. Area, about 50,000 square miles. Population (estimated), 490,585. Capital, Kuching.

**Change of Government.** The territory of Sarawak, obtained in part by Sir James Brooke from the Sultan of Brunei in 1841, remained under the Brooke family as the "White Rajahs" of Sarawak until 1946. The country was recognized as an independent state under the protection of Great Britain in 1888. In September, 1941, the centenary of the first Rajah's assumption of power, a new constitution was promulgated and executive and legislative councils were provided for. Before action could be taken the country was occupied by the Japanese (December, 1941). Allied troops reentered in June, 1945, and a military government was set up. Rajah Charles Vyner Brooke was absent from his country four and one-half years before his return in April, 1946.

In 1945 the Rajah proposed the cession of Sarawak to Great Britain. The British Government accepted the proposal, and announcement of the change of Sarawak's status to that of crown colony was made in the British House of Commons on February 6, 1946. The House of Commons showed some anxiety as to how far the move had the approval of the people of Sarawak, and the Rajah undertook to consult them upon his return. The cession was formerly proclaimed in Kuching on July 1. Lieut. Gen. Sir Charles Clarke was appointed Governor of Sarawak.

At no time in 1946 was the situation easy. In response to continued pressure from Britain the matter was put to the State Council (Council Negeri), which voted in favor of cession, but with the majority of Malay representatives opposed and Chinese equally divided so that the Europeans carried the vote. Bertram Brooke, brother of the Rajah and heir-presumptive, together with his son Anthony, head of the 1945 provisional government, continued actively to oppose cession.

Criticism of the British Government's denial of permission to Anthony Brooke to reënter Sarawak produced a House of Commons statement by the Colonial Secretary on December 19 and some sub-

sequent debate. Creech Jones called Brooke's demand for the restoration of the Raj, with himself or his father as Rajah, an attempt to "subvert existing authority" in behalf of "a small and unrepresentative minority of the people." Opposition leader Winston Churchill described as the "perfect dec-

laration of tyranny" the Colonial Secretary's further statement that Sarawak urgently needed reconstruction and therefore its people should not be confused by another constitutional problem. Anthony Brooke proceeded to Singapore in the hope that the decision might be reversed.

## STATISTICS OF STATE SCHOOL SYSTEMS, 1943-44

State, District of Columbia or Outlying Part	Estimated Population 6-17 Years of Age July 1, 1944	Enrollment			High- school Graduates	Average Daily Attendance	Average Number of Days Schools were in Session	Average Number of Days Attended by Each Pupil Enrolled

\* Statistics of junior colleges in California and other States omitted when possible.

<sup>a</sup> Statistics incomplete.

<sup>b</sup> Estimated basis.

**Population.** The population of Sarawak consists of Malays, Dayaks, Milanaus, Kayans, Kenyahs, Muruts, and other indigenous peoples, together with Chinese and other settlers. Schools are conducted by the Church of England, Roman Catholic, American Methodist and various other missions in the country.

**Resources.** Sarawak is rich in coal, oil, rubber, diamonds, and gold. Exports customarily exceed imports. There is usually a treasury surplus of revenue over expenditure, a fact utilized by Anthony Brooke in questioning grants to Sarawak, which formerly has needed no financial aid from Britain.

**SAVINGS BONDS DIVISION, U.S.** A Division of the U.S. Department of the Treasury, formerly the War Finance Division, reorganized January 1, 1946. Its chief purpose is to continue the sale of savings bonds through the pay-roll savings plan and through schools, and to encourage the continued holding of savings bonds.

The Division and the Field offices operate through four main branches: Banking and Investment, Labor and Industry, Community, and Promotion and Publicity, all under the direction of the National Director, who is an Assistant to the Secretary. The sales organization (field) consists of offices in all States, District of Columbia, Hawaii, Alaska, and Porto Rico, actively operating in the recruiting of volunteer committees, sales, and promotional personnel. The Washington organization plans campaigns and advises and services the field workers. The Division enjoys the cooperation of all advertising media, including newspapers, radio, magazines and business publications, motion pictures, labor, business, schools, and many other groups. National Director: Vernon L. Clark.

**SCHOOLS.** A report by Francis G. Cornell, Chief, Research and Statistical Service, U.S. Office of Education, showed that public school enrollment statistics from States for the year 1943-44 indicate a reduction of about 8 percent during four years of war. In 1939-40, enrollments for the continental U.S. were 25,400,000, and average daily attendance was 22,000,000. In 1943-44, enrollment and average attendance were, respectively, 23,300,000 and 19,600,000. (See table, pages 564-565.)

Most of the reduction is attributed to withdrawals of young people into the armed forces, opportunities for employment and a prewar decrease in birth rates. In Apr., 1944, approximately 3,000,000 people of school age, who normally would have been in school or college, were in the armed forces or in the civilian labor force.
